The above account demonstrates how the movement was basically reactive, and opponents have thus branded it as negative. A frequent jibe leveled at freethinking speakers is, "You've spent all this time telling us what you don't believe in. Now tell us what you do believe in." Unfortunately, a few respond with "nothing." As will emerge, this is far from the truth. Robertson rightly dismissed as a "whimster" someone with no consistency, responding entirely to mood and "flighty nonconformity." This has a political counterpart in someone always "agin' the government," no matter what it is or does. Nevertheless, negativity is a necessary first step, especially when dealing with "religions of the book" (Judaism, Christianity, Islam). All progress is by incremental steps arising from criticism of the status quo. A caveman objects to the dark before seeking a means of introducing light. A farmer removes weeds before planting crops. A surgeon extracts pus before stitching up a wound. Religionists have followed the same route. Reformed churches arose through objections to Roman Catholicism; Islam, to Christianity; Christianity, to Judaism; Judaism, to idolatry. Until these objections had been voiced and acted upon, sweeping aside old presuppositions and "venerable" institutions, development was impossible. Some aspects of the old, seen as of abiding value, were retained, and some aspects of the new, seen as "jumping out of the frying pan into the fire," were censured in their turn and replaced by later generations.

Another criticism leveled at freethinkers is that they believe in inevitable progress—a neophilia that worships change for its own sake—and it is true that until World War I there was something like a facile cult of progress in the first world. But this was not confined to freethinkers, and it has all but vanished now. Even if it were still influential, it is surely better than a cult of Armageddon.

Harking back to freethought's French and Italian derivation, other critics have indicted it for profligacy. Whatever the original meaning of "libertine," it is certainly associated more with Casanova than with Kant. As Rector Kroll says in Henrik Ibsen's *Rosmersholm* (1886), "I have always believed that between freethought and free-love no great gulf is fixed." Yet while Robert OWEN, George ELIOT and G. H. Lewes, H. G. WELLS, C. E. M. Joad, and Bertrand RUSSELL regarded conventional marriage as mere priest-made law, freethinkers do not appear to lead more "abandoned" lives than others of their social class and occupation. Indeed, many could be called puritanical. Nor do they seem more prone to homosexual activity. But if sexual "perversion" be an issue, what is more perverse or "unnatural" than clerical celibacy?

A more recent and sophisticated criticism of freethought is that it is, by most freethinkers' own philosophy, an oxymoron in that they profess belief in DETERMINISM. This issue has been ignored by many writers on the subject, but Robertson and Chapman COHEN, long-serving president of the NATIONAL SECULAR SOCIETY, attempted to deal with it. Robertson argued that

thought is a "basic instinct," where the idea of being "free" or "bound" should not apply. Freethought, on the other hand, points to a different degree of employment of the faculty of criticism: freethinkers are not terrorized by a veto on criticism, and they are not hampered, or are less so, by ignorant presuppositions. Cohen argued that "freethought" is a word used in sociology, analogous to phrases like "free man" or "free people," to denote the absence of restraint or foregone conclusion, and that it "says nothing as to the nature of thought, the origin of thought, or the laws of thought." According to him, "thought" applies to physical science, where freethought has no meaning.

In the light of modern knowledge we can say that thought is not only mediated by neurotransmitters and synapses (chemicals and connections between nerve cells) in the brain, but that thought strengthens and extends them. Thus, unless checked by self-censorship induced by external forces, thought leads to more thought in a deterministic fashion until eventually old ideas no longer relate to experience and so become incredible, while new ones with a better relation emerge to take their place. Following Lewes's emphasis on the "social medium" of language, in his *Grammar of Freethought* (1921) Cohen stressed that if freethought does not lead to free expression and social interaction, it is lost to both society and the individual. Indeed, without language thought itself is scarcely possible and, in odd cases, children brought up without it present as jibbering idiots. Since our early ancestors came down from the trees there has been relatively little biological evolution. Development has been psychosocial. Removal of barriers to thought and its transmission has thus been a major objective and achievement of freethought.

Essentials of Freethought. Giving a National Secular Society centenary lecture in 1966, the philosopher Paul Foulkes said freethought has five basic characteristics: (a) no party line, (b) no absolutes, (c) no censorship, (d) no sacred books, and (e) no sacred names. At first glance this catalog may seem to reinforce the perception of negativity at the heart of freethought, but scrutiny shows these apparent negatives have positive outcomes.

(a) In the nineteenth century it was quite common for freethinking literature to refer to "the freethought party." This was not meant in a party-political sense. There was no intention to endorse parliamentary candidates, though individual freethinkers who did contest elections were usually assured of strong support from their colleagues. From the 1860s to the 1880s, when Charles BRADLAUGH was chasing and eventually capturing a seat in Parliament, almost all British freethinkers supported the Liberal Party on its Radical, not Whig, flank. Since that time political views have been more polarized among English-speaking freethinkers. On the Continent there has long been a close association with socialism. But a feature of freethought organizations is that political and philosophical labels are left to individuals to adopt.

(b) In contrast with worldviews, mostly religious, that claim to be valid for all time, freethought does not acknowledge absolutes. Ideas and opinions fundamentally depend on knowledge, and as it changes so may they. But two false conclusions from this proposition must be corrected. First, freethinkers are not in a state of perpetual mental flux. The name for that is neurosis. Actions need the guidance of stable attitudes. All freethought proclaims is that these are provisional. Second, though some freethinkers may adhere to postmodernism, relativistic ethics, or other manifestations of deferment to any and every personal "judgment," most do not (see EUPRAXSOPHY; MORALITY FROM A HUMANIST PERSPECTIVE). While allowing that we do not always—and may never—know which scientific and social beliefs and practices are "right," we do know beyond reasonable doubt that some are "wrong." These include witch phenomena and persecution, flat-earthism, geocentrism, fortune telling, belief in demon possession, trial by ordeal, animal and human sacrifice, slavery, torture, exploitation, extortion, child abuse, and major felonies. And we have a duty to speak out against and try to eliminate them without causing greater harm through indiscriminate warfare.

(c) However well intentioned, curbs on free expression are usually wrong everywhere and every time. They deprive the engine of society of its essential fuel for advancement, oppress their victims, and corrupt their perpetrators. Thus freethinkers have been implacable foes of censorship operated through catchall laws against sedition, obscenity, BLASPHEMY, and defamation whose aim is to stifle legitimate criticism of tyranny, prudery, absurdity, and corruption. They have sought to rescue manuscripts from oblivion and books from burning, and to save authors, artists, publishers, printers, and booksellers from fines, jails, or gallows. Yet they recognize that, especially with the power and penetration of modern media, there are legitimate limits to free speech and publication when the well-being and safety of nations and individuals are threatened. These include curbs on the publication of military (not "official") secrets, child pornography, incitements to ethnic violence, and malicious libel.

(d) A particular feature of freethought is that it has no sacred books. Throughout the literature of unbelief one will find frequent references to seminal works that have liberated humankind from past errors and prejudices. Such titles include Paine's *Rights of Man* and *The Age of Reason*, Charles DARWIN's *Origin of Species*, Winwood Reade's *Martyrdom of Man*, Ernst HAECKEL's *Riddle of the Universe*, James Frazer's *The Golden Bough*, and *The Works of Robert G. INGERSOLL*. These are revered but not venerated. Freethinkers acknowledge that they are creations of their time, owing much to writers who went before them and containing errors and omissions corrected by writers who followed them. In this crucial way they are very different from the sacred books of

"revealed" religion, which are generally believed by the faithful to be divinely inspired and free of error. If they contained only devotional and theological material, that would be bad enough for their stultifying effect on believers. Unfortunately, in most cases they also purport to be compendia of the physical sciences, textbooks of the social sciences, and manuals of morality. Protected from criticism by temporal powers and taught in both Sunday and secular schools, these "spiritual" texts enshrine the beliefs and customs of bygone ages. As there are some "eternal verities," not everything in them is valueless or pernicious, and their language has often enriched secular literature. But there is no religious yardstick to distinguish among the good, indifferent, and bad. However retranslated and reinterpreted, they retain an unyielding hold on society that each generation has to struggle against.

(e) Just as the writings of freethinkers have no special status placing them beyond criticism, so freethought's writers and organizers do not enjoy infallibility or special privileges. Yet in all fields there are acknowledged authorities whose range of scholarship and depth of thought entitle them to a position of influence and citation. Individuals do not rethink all knowledge for themselves. They assimilate a modicum, hopefully reflect on it, and perhaps modify it to become authorities themselves. If they become celebrated freethinkers they do not expect to be accorded sanctity by their fellows and assuredly will not achieve it.

Aspirations of Freethought. While freethinkers have usually outshouted religious reformers in their criticism of existing faiths and have been willing to face scorn, obloquy, or persecution for their heterodox opinions, they do not on the whole embrace negativity for its own sake. Indeed, as this author said in *Nucleoethics: Ethics in Modern Society* (1972), "Many of them would be inclined to say, with an indulgent smile, that if myths brought comfort and did no harm it would be churlish to denounce them." Of course they would still feel an obligation, in the interests of truth, to observe that myths are neither history nor philosophy, though some may encapsulate a useful symbolic or moral message. But they would feel no urge to unite with like-minded people to create organizations and publications to promote their views. There may be "many mansions" in a heavenly father's house; there are none within freethought.

Some freethinkers may be driven by an emotional cussedness, but most see positive benefit to society in VOLTAIRE's *ecrasez l'infame* (literally, "curse infamy") and David HUME's railing against "the whole train of monkish virtues" and faith that is impervious to reason and often to humanity. They recall Voltaire's aphorism that those who believe absurdities can commit atrocities, but always with the best will in the world. Apart from that, reliance on God or gods undermines self-reliance, and belief in an afterlife devalues this life. For if we were really spiritual beings with an immortal destiny, nothing would be more appropriate for us all than monasticism.

From the foregoing it can be seen that the two fields where freethinkers have been most active are education and law reform. Clearly they have been in the forefront of demands for secular education, but they have also campaigned for free, compulsory, and further education. While believing that it should be available to all children through state schools and that the process should be publicly fostered throughout life, they supplement government provisions with classes and lectures of their own. Generally, their exertions are intellectual; but they recognize the role of physical training and the arts. Special attention is also given to moral education.

Freethought's moral benefits come from exposing immoralities in religious beliefs (biblical crimes, substantial abandonment of individual responsibility, penalizing opinion, putting faith before works) and not from unbelief per se; actual behavior is influenced by the quality of parental care, education, pragmatism, technology, mass media, bureaucracy, and law. Thus freethinkers have been prominent in reform of the laws that restrict legitimate freedoms, obstruct science, and promote injustice, chauvinism, and inhumanity.

FREIE GEMEINDEN. The Freie Gemeinden (Free Congregation) movement had its origins in dissension within the established Evangelical (Lutheran) and Catholic churches in Germany in the early nineteenth century. The post-Napoleonic repression confirmed a conservative alliance between church and state, giving rise to a rationalist countermovement (see RATIONALISM). While this dissent sometimes produced congregations that remained Christian, others, influenced by radical

Hegelianism, moved toward a fully secular orientation. Religious holidays, scriptures, and authority were replaced with broader-based alternatives. Instead of pastors, there were "speakers" elected by local members. By the mid-1840s, these groups converged into an outright armed resistance to the government, erupting in the revolution of 1848–49.

With the defeat of the revolution, thousands of freethinkers (Forty-Eighters) immigrated to the United States, where they quickly established new Freie Gemeinden in cities like St. Louis and Milwaukee, and also in rural areas. A few similar groups already existed, such as those established by Friedrich Münch and Edward Mühl in rural Missouri. Some forty Free Congregations had been formed by the early 1850s; they featured lectures, debates, and the foundation of inexpensive schools. A competing organization, the Verein Freier Männer (Free Men's Society) criticized the practice of paying speakers on the grounds that it encouraged a priesthood. There was also political division; older rationalists had been drawn into the orbit of the Democratic Party, while more recent arrivals generally endorsed the new Republican Party and its more explicit opposition to slavery.

Anticipating armed conflict, freethinkers formed paramilitary groups whose hundreds of members engaged in regular military drills. At the outset of the Civil War, many such groups enlisted directly in the Union army. In Missouri they played a dramatic role in saving that state for the Union cause. Whole regiments from Indiana, Illinois, Wisconsin, and Missouri were made up of radical Germans. When required to designate a chaplain, one Indiana regiment selected one of its most militantly freethinking members and confirmed beer as the sacramental beverage. General August Willich, a Forty-Eighter who had been a Communist in the old-country revolution, led the successful charge up Missionary Ridge in the Battle of Chattanooga in 1864. Thus German immigrant freethinkers served decisively to defend the republic against the reactionary treason of the Christian Confederacy.

After the Civil War the Freie Gemeinden were reestablished, often constructing impressive new buildings. The St. Louis building, which still stands, bears the motto *Wahrheit Macht Frei* (Truth Makes Us Free). These premises supported extensive libraries, classrooms, and auditoriums. While the leadership tended to come from the intellectual or professional class, the rank and file was dominated by workers in various trades. A turn-of-the-century bulletin from the North St. Louis group promoted night courses "for such men as are eager to receive an industrial education and cannot afford either the time or the money required for colleges or universities." Hence, the buildings came to serve as community centers, with a wide range of activities including singing societies and the like. They sometimes cooperated with the *Turnverein* (athletic organizations later popularly known as Turners); at other times Turner groups gravitated to more mainstream nonpolitical activities, distancing themselves from the more radical ANTICLERICALISM of the freethinkers.

In social-democratic strongholds like Milwaukee, a working alliance developed among Turners, Socialists, and freethinkers (see SOCIALISM AND UNBELIEF), cemented by Socialist victory in local elections in 1910. From the time of Haymarket in the 1880s (see ANARCHISM AND UNBELIEF), Chicago had always had a militant tradition. But the advent of anti-German and anti-radical policies during World War I blunted its advance and precipitated a long, slow process of decline for the Freie Gemeinden. To be sure, local organizations persisted for decades, contributing to the formation of the AMERICAN RATIONALIST FEDERATION in 1955. In 1967 the Milwaukee group marked its centennial; Mayor Henry W. Maier sent greetings, stating: "That you have contributed to the cultural, the social and the literary life of Milwaukee is without question. You have also maintained for posterity those precious old-world customs which might otherwise have been forever lost." A commemorative book noted that "for a century now, these rationalist groups provided a much needed forum for unorthodox, and often very unpopular ideas. EMERSON spoke to them, and INGERSOLL, Clarence DARROW and Emma GOLDMAN. They provided a platform for those who advocated prison reform and woman suffrage; they discussed unemployment insurance and social security long before the days of the New Deal."

But elsewhere, dwindling membership led to dissolution. The St. Louis group ceased operation in 1970, donating its remaining funds to the Ethical Society (see ETHICAL CULTURE). Walter HOOPS, a mainstay of the group, continued to be active in the Rationalist Society, which still exists.

A 1966 study of the Sauk City, Wisconsin, group focused on the reasons for its decline, stating it was in a "death trance" and noting that it had affiliated with the Unitarian Universalists (see UNITARIAN UNIVERSALISM) in 1955. But gainsaying that dire analysis, in 2002 this last surviving Freie Gemeinden marked its 150th anniversary with a celebration, as "a Bavarian band played polkas, children danced among swirling leaves, adults sipped beer in the sunshine—and no one told anyone what to believe." Similarly, in rural Hermann, Missouri, Eduard Mühl's house has been incorporated into the complex of buildings maintained by the state to mark the permanent contributions Germans made to Missouri history. And in Austin, Texas, the original building of the German Free School, built in 1857, is now the headquarters of the German-Texan Heritage Society. In these ways, the Freie Gemeinden survive as a part of America's intellectual heritage.

FRED WHITEHEAD

FREUD, SIGMUND (1856–1939), Austrian founder of psychoanalysis.

Early Life. Sigmund Freud was born in Freiberg, Moravia, in 1856, and his family moved to Vienna when he was four years old. He entered the science and medical faculty of the University of Vienna in 1873, specializing in anatomy and physiology. From 1876 he studied under Ernst Brücke, a member of the Helmholtz School, a group committed to applying the methods of the physical sciences to medicine. Freud's impressive research in Brücke's Institute of Physiology opened up the prospect of a promising academic career, but financial considerations led to his undertaking a course in medicine in 1882 with the aim of starting a private practice. Toward the end of his medical studies he spent some six months in Paris studying under Jean Martin Charcot, whose ideas on the nature of what was termed *hysteria* (symptomatology for which there was no apparent organic cause) were to have a considerable influence on his future.

Career. In 1886 Freud set up in private practice as a neuropathologist, and was soon to become effectively what we would now call a psychotherapist. In the period in the 1890s during which he developed his psychoanalytic techniques, he treated patients for a variety of mental and physical ailments which, under the influence of the ideas of Charcot and of Josef Breuer, he believed had their origins in mental disturbances, predominantly episodes of a sexual nature that the patient could no longer recall. (In Freudian terminology, the memories had been repressed into the unconscious.)

In the mid-1890s a combination of preconceived theory and his analytic technique for reconstructing unconscious memories (incorporating his belief that somatic symptoms were symbolic representations of traumatic events) led to Freud's claiming clinical confirmation for his postulate that repressed memories of sexual abuse in early childhood constituted an essential precondition for hysteria and obsessional neurosis. However, he soon lost faith in what psychoanalysts later called the seduction theory, eventually harnessing his dubious clinical claims (retrospectively modified) to support the notion of infants having a rich psychosexual fantasy life. These latter ideas, which to a large extent replaced the analytic search for early childhood traumas, became the bedrock of psychoanalysis. A detailed presentation of his psychoanalytic interpretative procedures was given in *The Interpretation of Dreams* (1900), and the first fruits of his new direction were described in *Three Essays on the Theory of Sexuality* (1905). Contrary to traditional accounts, Freud's early psychoanalytic writings were generally treated with respect, though several contemporary psychologists and psychiatrists expressed doubts about his clinical claims and his largely speculative theories in terms that present-day critics recognize as having considerable merit.

There followed a constant stream of writings over the next thirty years, during which Freud published a handful of case histories designed to illustrate his clinical methodology, as well as a great number of publications in which he developed his ideas further in a variety of directions, culminating in his (unfinished) final work in which he attempted to sum up his achievements, *An Outline of Psychoanalysis* (1940). Concurrently he inaugurated and led psychoanalytic organizations whose central purpose rapidly became that of disseminating his ideas to a wide public. They accomplished this purpose to such an extent that by the middle of the twentieth century, many of Freud's ideas achieved the status of received knowledge throughout the Western countries, most notably in the United States.

The last period of Freud's life was blighted by cancer of the mouth, diagnosed in 1923. Nevertheless, despite numerous operations, he remained a prolific writer throughout these years. Following the Nazi takeover of Austria in 1938 he emigrated to London, where he died in 1939.

Religious Beliefs and Writings. Born to nonpractising Jewish parents, Freud remained an atheist (see ATHEISM) to the end of his life. However he retained a strong sense of a Jewish identity, becoming conversant with the Old Testament in his early childhood, though his first writings on the origins of religious beliefs were of a general nature. As early as 1907, in his paper "Obsessive Actions and Religious Practices," he drew an analogy between the rituals of religion and those of

obsessional neurosis. In his essay on Leonardo da Vinci (1910) he associated the belief in a personal God with a child's relation to a father figure, and developed this notion in *Totem and Taboo* (1913), in which he proposed that the origins of religion, among other social and cultural phenomena, were to be found in the Oedipus complex. He reiterated these propositions in *The Ego and the Id* (1923), in which he argued that religious and moral values originally arose in the very earliest stages of human history from the process of mastering the Oedipus complex, and that these had then become an inherited characteristic of humankind.

In his lengthy study of religion, *The Future of an Illusion* (1927), Freud brought all these themes together in an essay that combined an occasional astute analysis of the psychological sources of religious belief with more contentious propositions based on psychoanalytic concepts. Describing religion as comparable to a childhood neurosis, he ended by expressing his view that human beings will eventually overcome their dependence on such beliefs. He made use of these same themes in his final foray into religion, *Moses and Monotheism* (1939), in which he maintained that monotheism originated in Egypt and that Moses was an Egyptian prince who assumed the leadership of a Semitic tribe. This highly speculative essay was ill-received by Jewish and other biblical scholars.

Psychoanalysis as a Belief System. Many commentators have observed that the man who claimed to have unmasked religion as a neurotic belief system was himself the founder of a movement that had many characteristics in common with dogmatic religion. Freud saw himself as a man with a mission to spread the word about psychoanalysis, and his propensity to compare himself with Moses has frequently been noted. Some of his basic ideas he treated as obligatory articles of faith rather than as fallible scientific theory; he described both his dream theory and the Oedipus complex as "shibboleths" that separated believers from unbelievers. Dissenters from the true path, such as Adler, Stekel, and Jung, were forced out of the Vienna Psychoanalytic Society and denounced as heretics. In his public writings Freud's explanation for their supposed transgressions was that they had encountered within themselves resistances to "analytic knowledge" which resulted in their rejecting what they had previously learned. In similar fashion, he explained opposition from "the representatives of official science" as a "manifestation of the same resistance which I had to struggle against in individual patients"; in other words, intellectual opposition was of little account other than as an exemplification of his own theories. In such ways Freud ensured that, for the believer, classical psychoanalysis was impervious to criticism.

The cultlike nature of the fledgling psychoanalytic movement was exemplified by its exclusiveness and hostility toward critics, excessive reverence for the founder, evangelistic fervor, and propensity for the formation of schisms. From these beginnings it flourished like no other movement that claimed the status of science (though precedents can be found in religion). Both critics and converts have remarked on the capacity of Freud's psychoanalytic writings to be a source of inspiration and consolation comparable to religious literature. But influential as it has been, the failure of psychoanalysis as a discipline to provide plausible grounds for the truth of its more distinctive propositions resulted in its decline in the last decades of the twentieth century. Nevertheless, its intrinsic capacity to provide facile explanations for virtually any human psychosocial phenomenon is likely to ensure its survival in one form or another for the foreseeable future.

ALLEN ESTERSON

FROMM, ERICH (1900–1980), German humanistic psychologist. Erich Fromm balanced a strong allegiance to his practice, which he termed "radical humanistic psychoanalysis," and his desire to write. A chronicle of his writings shows Fromm to be as much a moral philosopher and social critic as he was psychologist.

Born in Frankfurt, Germany, he grew up in a devout Jewish family. An intensive religious education provided models for his intellectual growth, some of which he would later modify and some reject, moving toward an ethics built on understanding of the human condition (see HUMANISM).

Crossing the Boundaries of Traditional Disciplines. Fromm trained in philosophy, sociology, and psychology, receiving a doctorate in philosophy at the University of Heidelberg at age twenty-two. It was this background that Fromm brought to his studies at the Berlin Psychoanalytic Institute, approaching the practice of psychoanalysis from the standpoint of philosophy rather than medicine. He lent a cultural and social perspective to psychoanalysis by contending that neurosis can result from culturally inspired needs rather than from frustration of biological drives. He held that psychoanalysts, like theologians, should waken the "voice of conscience" so as to appeal to a patient's morality.

Fromm began practicing psychoanalysis as a disciple of Sigmund Freud, but soon took issue with Freud's preoccupation with unconscious drives and his consequent neglect of the role of societal factors in human psychology. His career was under way when Fromm immigrated to the United States in 1934, shortly after the Nazis assumed power in Germany. Inspired by fellow neo-Freudians, among whom he is generally counted, by the writings of Karl MARX, and by the humanistic tradition, he explored new themes. Throughout his years on the faculty of Columbia University (1934–41) he came into conflict with orthodox Freudian psychoanalytic circles.

Increasingly Controversial Views. His name lights a fire of recognition: it was Fromm who spotlighted such concepts as alienation and self-awareness, now part of our vocabulary. His numerous writings on human nature, ethics, and love attracted the interest of social scientists and a wide general readership. In *The Art of Loving*, Fromm recognized that love is the only sane and satisfactory answer to the problems of human existence. He became known as the Apostle of Love. He also wrote books of criticism and analysis, on Freudian and Marxist thought, on psychoanalysis, and on religion—presenting views that were increasingly controversial (and surprising from a psychoanalyst), challenging, as he did, religions that have at their roots an authoritarian ethics, and rekindling the query, "If God is dead, is everything allowed?" He argued for a humanistic ethics as the rightful alternative both to authoritarianism and to moral relativism. He argued for the use of reason and he upheld the claim that ethics is objective, that some values are higher than others.

Fromm was a forerunner in broadening the viewpoint of the social sciences—recognizing their need to involve themselves with issues of immediate concern to society. A profound critic of materialistic values, he argued for a society that fosters productive and meaningful relations with others and responds to what he saw as each person's basic need to avoid loneliness. In the 1950s he warned against the dangers of a society dominated by technology, and in 1957 helped to found the National Committee for a Sane Nuclear Policy (SANE), the name taken from one of his widely read books, *The Sane Society.*

In the territory which he has made his own, "Frommianism," he defined the need for a radical humanism. He called for a rebirth of enlightenment in a transformed society which would allow each person to fulfill his or her individual needs while maintaining a sense of belonging through bonds of social brotherhood. He believed that we could develop a sane, psychologically balanced society. His criticisms of our maladies ran deep, but his hopes ran high.

Relation to the Social and Intellectual Times. Because Fromm crossed so many disciplinary boundaries, including those of religion, sociology, history, and economics, many academics regarded him as a dilettante. Traditional psychoanalysts found his focus on social psychology of little value to their clinical practices. His widespread influence on the human potentials movement, however, is indisputable, as is the growing recognition of Fromm as a vital contributor to social thought in the modern era. He received the accolade of rare honorary Swiss citizenship, having moved to Switzerland four years before his death. Many of his (more than thirty) major works are considered classics. Erich Fromm's vision has not been abandoned.

JEANNETTE LOWEN

FROUDE, JAMES ANTHONY (1818–1894), English historian, author, and agnostic (see AGNOSTICISM). James Anthony Froude's writings reflect the religious concerns and struggles of the mid-Victorian era. He was born at Darlington rectory, Devon, where his father, Robert Hurrell Froude, was rector. Formative influences on Froude were his father, a learned, cultivated man and talented artist; his brother, Richard Hurrell Froude, a man of considerable genius and dominant personality who joined with John Henry Newman in the Anglo-Catholic Oxford ("Tractarian") movement; and Newman himself, whose personality and striking sermons (Froude described them as "incisive," "never unreal," "subtle"), early drew the young Froude toward Catholicism.

A precocious and sensitive youth, Froude entered Westminster School in 1830, where he suffered brutal humiliations at the hands of schoolmasters and students. Froude relates this experience through his fictional alias, Edward Fowler, in *Shadows of the Clouds* (1847). Leaving Westminster, Froude was tutored privately before entering Oriel College, Oxford, in 1836, taking

rooms immediately above Newman's. He was elected a fellow of Exeter College, Oxford in 1842. During these academic years, Froude was spiritually torn and anguished—divided between his devotion to Newman while increasingly repelled by his Catholic doctrines. The struggle is portrayed in his controversial book, *The Nemesis of Faith* (1849), which he called a "cry of pain." While emotionally moving, the story is sentimental and melodramatic, but something of an epitome of the crisis of the mid-Victorian "honest doubter."

While preparing for deacon's orders in the Church of England, Froude was concurrently reading Ralph Waldo EMERSON, Gotthold Ephraim LESSING, Friedrich Schleiermacher, Thomas Carlyle, and Baruch SPINOZA. The latter two proved especially powerful influences as Froude moved away from the dogmas and historical claims of orthodox Christianity. Another crucial event for Froude was Newman's invitation to write *Life of St. Neot* for Newman's *Lives of the English Saints* series. As Froude examined the sources on Saint Neot, he was struck by the unhistorical fables and the credulity revealed in these accounts. As Froude found, the *Lives* "were not so much strict biography, as myths, edifying stories . . . designed not to relate facts, as to produce a religious impression." Thereafter, Froude vehemently opposed miracle stories and the supernatural as historical categories.

Froude's fame rests primarily on his four-volume biography *Thomas Carlyle* (1882–84) and his numerous historical works, most notably the controversial twelve-volume *History of England from the Fall of Wolsey to the Defeat of the Armada* (1856–70). The latter can be read as a critique of both the Catholic Church and the Oxford movement, and a defense of the Protestant protest against what he saw as superstition and moral equivocation.

Through his life, Froude remained attracted to aspects of Newman's subtle mind and religious sentiments while wholly won over by the prophetic power and rectitude of Carlyle and the saintly virtue and rationalism of Spinoza. The religious skeptics of the next Victorian generation, including Leslie STEPHEN and William Kingdon CLIFFORD, did not suffer the same anguished choice; their agnostic essays breathe a sure, often fierce, confidence in positivist science (see POSITIVISM) and RATIONALISM.

JAMES C. LIVINGSTON

GAGE, MATILDA JOSLYN (1826–1898), American suffragist and freethinker. The youngest member of the National Woman Suffrage Association (NWSA) leadership triumvirate with Elizabeth Cady STANTON and Susan B. Anthony, Matilda Joslyn Gage was born March 24, 1826, in Cicero, New York. The three women, editors of the first three volumes of the *History of Woman Suffrage*, "will ever hold a grateful place in the hearts of posterity," predicted the *Woman's Tribune* in 1888.

Gage dropped out of the suffrage cause after an unsuccessful move to prevent what she perceived as a conservative takeover of the women's movement in 1889. Believing that the attempt on the part of Christian fundamentalists to place God in the Constitution and prayer in the public schools represented the great "danger of the hour," Gage turned to what she believed was her "grandest, most courageous work." In 1890 she formed the Woman's National Liberal Union, an organization with a dual purpose: to challenge the drive by her time's Religious Right to merge church and state, and "to free woman from the bondage of the church," which was the "chief means of enslaving woman's conscience and reason." She published her magnum opus, *Woman Church and State*, in 1893. Anthony COMSTOCK, self-appointed censor of the US press and mail, immediately banned the book from public school libraries. A powerful indictment of the church's primary role in the oppression of women, the book documented the gynocidal witch burnings (9 million women, Gage estimated, murdered by the church and later the state) and the institutionalized sexual abuse of women and children by the priesthood.

The "theory that woman brought sin and death into the world" is the "foundation of the Christian Church," Gage charged at an 1878 FREETHOUGHT convention, and woman was placed in a "condition of subjection, of subordination" to man as punishment. Women's "political, legal, educational, industrial, and social disabilities of whatever character and nature" result from "this "prevailing religious idea," she argued.

Gage theorized that the early church accepted the equal feminine nature of the divine, citing evidence of women serving at the altar and administering the sacrament. Slowly forcing women out of the priesthood and removing the female in the godhead, the church "passed over to idolatry in a worship of the masculine." This transition marked the greatest depth of "the night of

moral and spiritual degradation," she continued. "In place of truth, falsehood prevailed; in place of unity, division." Making marriage a sacrament, the church required women to pledge obedience to their husbands in the marriage ceremony. When canon law became the foundation for common law, married woman's subordinate position rendered her legally nonexistent. The idea that the "two shall become one and the one is the man" robbed wives not only of their rights, but even their legal identity.

The great underlying creative principle, Gage believed, is "solely and distinctively feminine." At the 1888 International Council of Women, Gage expressed "profound surprise and astonishment" at the "almost total ignoring of the Divine Motherhood of God by those who have in any way referred to the Supreme Power" during the council. Each session began with an invocation, and Gage had been hard-pressed to find a woman minister who would "evoke the divine motherhood" in the prayer opening Gage's session. "In all ancient nations we find goddesses seated everywhere with gods, in many instances regarded as superior to them," she told the audience. Critical to elevating the position of women was returning the motherhood of God to the place of sacredness from which she had been removed by the patriarchal/Christian overthrow.

Women were not the only victims of Christianity; the church had also been the "bulwark of slavery" and the authority of the Bible had been used to oppose "science, art, inventions, reforms of existing wrongs," resulting in "even the most enlightened nations" becoming stuck in the stage of "barbarism," Gage charged. "I look upon ordinary religious belief as almost death to the soul," she wrote to her son that year, fearing that he was "drifting into Churchianity." Gage embraced moral relativism, explaining that "no absolute standard exists, but morality is relative, depending upon the general condition of society, and what is looked upon as right in one age of the world is regarded as wrong in a preceding or succeeding one."

Gage moved to an interest in THEOSOPHY, joining the American Theosophical Society in 1885. Her investigation of the occult—she attended séances and psychic readings and had astrological charts cast for her family members—was based on the premise that paranormal events constituted simply another aspect of the natural world, which had been relegated to the world of female/evil in the patriarchal/Christian political takeover.

Contributing to *The Woman's Bible*, which Stanton edited, Gage moved to a new level of analysis, interpreting the Bible as "an occult work written in symbolic language." While recognizing that it could be read as history or mythology, Gage suggested the Bible might also be "[a] Book of the Adepts . . . a record of ancient mysteries hidden to all but initiates." The book of Revelation, she suggested, understood from this perspective, "is a purely esoteric work, largely referring to woman, her intuition, her spiritual powers, and all she represents."

A year before her death, Gage explained her theosophical belief in reincarnation to her ten-year-old grandson: "You are more alive than ever you were after what is called death. Death is only a journey, like going to another country . . . people . . . come back and live in another body, in another family and have another name."

Gage remained hopeful about the future of women in her religious tradition who were rising up "against the tyranny of Church and State," in the most important revolution the world had yet seen. It "will shake the foundations of religious belief, tear into fragments and scatter to the winds the old dogmas upon which all forms of Christianity are based," she predicted. The result "will be a regenerated world."

Gage died on March 18, 1898, and her cremated remains are buried in the Fayetteville, New York, cemetery under a tombstone emblazoned with her motto: "There is a word sweeter than mother, home or heaven. That word is Liberty."

SALLY ROESCH WAGNER

GALILEI, GALILEO (1564–1642), Italian physicist and astronomer. A founder of modern science—which is to say, of modern methods of investigating natural phenomena—Galileo Galilei strongly asserted the need for REASON and experimental verification as opposed to the acceptance of truths based on dogma and the authority of the scriptures or handed down from ancient philosophers and through tradition. This stance earned him the fierce opposition of the Catholic Church, which fought his ideas to the point of convicting him of HERESY. He is one of the most important figures in the history of modern

thought, the first to promote mathematical RATIONALISM versus the millennia-old logico-verbal approach embraced by the followers of ARISTOTLE. Despite his formal displays of respect toward the church, he became a worldwide symbol of independence of thought and of the necessity for human beings to ground their beliefs in observed facts and in rational analysis of problems.

Early Life. Galileo was born in Pisa, Tuscany, on February 15, 1564, the son of musicologist Vincenzio Galilei and Giulia Ammannati. When he was ten, his family moved to Florence. At the age of seventeen his father sent him to the University of Pisa to study medicine, but he showed no interest in the discipline, devoting himself instead to mathematics and physical sciences under the tutelage of Ostilio Ricci. It is during this period that he established the isochronism of pendular oscillation—the fact that the period of a pendulum's swing is independent of the arc of its swing—giving rise to the legend that he had deduced it through careful observation of swinging lamps in Pisa cathedral. More plausibly, fine lute player that he was, he extended to pendulums a property observed in vibrating strings. The invention of the hydrostatic microbalance and a treatise on the center of gravity in solids led to him becoming known all over Italy. In 1589 Grand Duke Ferdinando I of Tuscany appointed him mathematics lecturer at the University of Pisa, where he began to study the motion and the fall of bodies (another legend is that to this end he dropped weights from the Leaning Tower of Pisa, that experiment being actually performed only years later by his pupil Renieri).

Teaching in Padua. In 1592 he moved to the University of Padua, where he was awarded the chair of mathematics, a more lucrative position in the lively cultural milieu of the Republic of Venice. While there he witnessed the tragic fate of philosopher Giordano BRUNO, denounced to the Inquisition for heresy and eventually burned at the stake in Rome for having claimed that the universe is infinite, an affair that left an indelible mark on Galileo and led to his cautious prudence toward the church. He remained in Padua for eighteen years, establishing the law of uniformly accelerated motion by means of an experiment using an inclined plane, which, by slowing down the fall of a sphere, allowed him to measure the time intervals involved. He also defined the principles of inertia and of relativity, disproving the Aristotelian misconception that the motion of a body is possible only under the action of a force (thrown bodies were supposed to carry along the force initially "impressed" on them).

Though Galileo became increasingly convinced of the validity of the Copernican heliocentric theory (as his private letters demonstrate), his charge in Padua was to teach the Ptolemaic system. Only after he learned in 1604 of the sudden appearance of a new star (actually a supernova) did he begin to speak publicly against the Aristotelian view of immutable skies and an immobile earth at the center of the universe.

Exploring the Skies. In 1609 Galileo learned about telescopes being made in Holland. Making basic improvements, he built a telescope with a linear magnification of about 30, a truly scientific instrument fit for exploring the skies. This enabled him to see the rugged and mountainous nature of the moon's surface, not the smooth reflecting sphere claimed by Aristotelians; to discover Jupiter's satellites (which he called *Sidera Medicea*, in honor of his former pupil and future employer Cosimo II de' Medici, Grand Duke of Tuscany); to describe the nature of the Milky Way as a cluster of separate stars; to perceive the unusual shape of planet Saturn; to observe the phases of Venus, similar to those of the moon; and to investigate the spots on the sun's surface. These astronomical discoveries led to the publication of his book *Sidereus Nuncius* (The Sidereal Messenger) written in Latin, as was customary at the time in the sciences. Despite widespread skepticism of the book's audacious claims, it publication made him famous throughout Europe, receiving the approval of Kepler and even of the Jesuit scholars in the Roman College.

During his years in Padua he lived with Marina Gamba, who bore him three illegitimate children, Virginia, Livia, and Vincenzio. The two daughters were later to become nuns, as was often the case when the father could not provide an adequate dowry for marriage.

Move to Florence. In 1610 he was appointed "Principal Mathematician and Philosopher" to the Grand Duke in Florence, with no teaching obligations and much more time for research. Between 1610 and 1616 he had an acrimonious dispute with Jesuit Christoph Scheiner over who had claimed priority in the discovery of sunspots. Aware that his Copernicanism was meeting with opposition from the church, he wrote the so-called Copernican letters, in which he tried to persuade ecclesiastics that the new scientific ideas were not at odds with the Bible if the Bible was interpreted correctly, and that it was in the interests of the church not to take a stand that in the face of evidence it would sooner or later have to recant. The letters represented, at the same time, a firm defense of the independence of science from faith. This resulted in a violent attack on Galileo by two Dominican friars, who accused him of heresy and unleashed what became a mounting tide of clerical opposition.

Conflict with the Church. In 1616 Galileo was warned by the authoritative theologian Robert Cardinal Bellarmine that while the Copernican model could be used as a mathematical tool in describing astronomical phenomena, it could not be considered true. This kept Galileo silent on the subject until 1623, when Cardinal Maffeo Barberini—an open-minded man of culture and an admirer of Galileo—became Pope Urban VIII. Full of hope, Galileo published *Il Saggiatore* (The Assayer), a brilliant lecture on the new scientific method and a pungent criticism of mediocre science (in particular meant to strike at Jesuit Father Orazio Grassi). It contains the

famous pronouncement that "the Book of Nature is written in mathematical characters." For *Il Saggiatore* Galileo adopted the Italian language, as he would for all his subsequent works, with the intention of reaching a wider audience than just the savants. Galileo's writing style ranks him at the highest levels in Italian literature.

Reassured by the success of *Il Saggiatore*, in 1632 Galileo published his celebrated *Dialogo sopra i due massimi sistemi del mondo* (Dialogue concerning the Two Chief World Systems), presented as an objective comparison of the Ptolemaic and Copernican systems, but in reality an open defense of the latter and a devastating argument against traditional Aristotelian views. The book deals with a wide range of subjects—motion, inertia, relativity, the universal behavior of falling bodies in a vacuum, and the movements of the earth—all brilliantly debated by three interlocutors, Salviati (Galileo's alter ego), Sagredo (a referee), and Simplicio (Aristotle's advocate). The main argument in support of the earth's rotation was based on the occurrence of tides (a mistake prompted by Galileo's eagerness to find experimental evidence for his claim). In order to obtain the imprimatur or mark of approval by the church, Galileo was obliged to close the book with this statement of Urban VIII: "God in His infinite power and wisdom could have conferred upon the watery element its observed reciprocating motion using some other means . . . and He would have known how to do this in many ways which are unthinkable to our minds." However he committed the impudence of putting the statement in the mouth of simple-minded Simplicio, thereby incurring the pope's resentment. At the time, Urban VIII was in difficulty, as Spanish cardinals were accusing him of being solicitous toward heretics. He had Galileo urgently summoned to Rome to be questioned by the Inquisition; eventually the old scientist was to undergo formal prosecution.

Conviction and Abjuration. During the trial Galileo was shown the torture chamber, if not actually tortured. He was found guilty of heresy for having claimed in contradiction of scripture that the sun is immobile and the earth rotates around it. He signed a written abjuration, prepared by the judges, that helped him escape more drastic punishment: "[W]ith sincere heart and unfeigned faith I abjure, curse, and detest the aforesaid errors and heresies and generally every other error, heresy, and sect whatsoever contrary to the Holy Church, and I swear that in future I will never again say or assert, verbally or in writing, anything that might furnish occasion for a similar suspicion regarding me; but, should I know any heretic or person suspected of heresy, I will denounce him to this Holy Office." He was sentenced to prison and to recite penitential psalms for three years. His *Dialogue* was banned and remained in the church's Index of forbidden works until 1835.

Galileo is said to have whispered, immediately after his abjuration, "and yet it [the earth] moves." Although this is quite unlikely, it is a fact that, only a few days later, he set out upon the reaffirmation of his Copernican credo, beginning to write his scientific masterpiece, *Discorsi intorno a due nuove scienze* (Dialogues concerning Two New Sciences). In this book—published in 1638 by the Elseviers in Holland—he dealt in particular with the resistance of materials and "local motion" (kinematics). Many topics had already been discussed in earlier books, but in *Discorsi* they are treated more rigorously and with extensive use of mathematics, including early approaches to infinity and infinitesimals.

This work was possible because his imprisonment, by concession of the pope, had soon been commuted to confinement in his villa in Arcetri, near Florence. Here he was to live in great isolation, receiving assistance in his later years from his pupils Viviani and Torricelli, and occasional visits from friends, admirers (including the English poet John Milton), and protectors such as the grand duke of Tuscany. His health, which had never been particularly good, gradually worsened, and he eventually became totally blind. He died on January 9, 1642.

Galileo and Modern Science. Galileo's legacy consists of three main points: the value of experiment for the advancement of knowledge, the importance of the mathematical treatment of phenomena, and the introduction of the concept of a reference system. Some of his methods have become standard practice in modern science, for instance, his approach to problems by concentrating first on the basic mechanism underlying a phenomenon, and only later introducing secondary effects as perturbations; his way of studying an ideal process by a gradual variation of feasible situations (for example, predicting the free fall of bodies in a vacuum through the analysis of their fall in increasingly diluted gases); his attention to technology and to its interplay with fundamental science; his recognition of the greater value of "doing" than of "speaking"; and his effort to make scientific approaches known to a wider public, even outside science.

Galileo's Intellectual Revolution. Galileo's greatness lies not only in his discoveries, in his cultural battles, and in his scientific methodology, but also in the problems he raised and left to his successors. He symbolizes the need for science not to be enslaved by power or commitments to dogma.

"Rehabilitation." The Catholic Church recently promoted Galileo's rehabilitation. However, seeing that abjuration is a violent imposition, it is cause for shame and guilt on those who impose it: it is therefore the church that should have been rehabilitated. This should have consisted not so much in a condemnation of the judges of Galileo's time, as in a denunciation of the church itself, which continues to commit the same mistakes that led to the prosecution of the scientist and, in particular, persists in its determination to impose its truth upon others.

GARDENER, HELEN HAMILTON (1853–1925), American freethought activist. Helen Hamilton Gardener was born Alice Chenoweth on January 21, 1853, near Winchester, Virginia. Her father was a circuit-riding preacher who aided the Union during the Civil War and died soon after. Her mother was a lifelong Calvinist. Alice graduated in 1873 from the Cincinnati Normal School, taught school until marrying at age twenty-two, then studied biology at Columbia University in the early 1880s. She adopted the name Helen Hamilton Gardener in her thirties. While lecturing and writing for newspapers using a male pseudonym, she met the nineteenth century's most prominent proponent of FREETHOUGHT, Robert Green INGERSOLL, and his wife, Eva. They encouraged Gardener to undertake her much-admired 1884 lecture series, "Men, Women, and Gods." She was dubbed "Ingersoll done in soprano" by the *New York Sun* and "the pretty infidel" by the *Chicago Times*. *THE TRUTH SEEKER* published her elegant lectures in print form the following year. A friend of Elizabeth Cady STANTON, Gardener was a member of the committee contributing to Stanton's *Woman's Bible*. As an agnostic in sympathy with Stanton's views, she was designated by Stanton to deliver her memorial address. Gardener quipped in that memorial statement that while most suffragists found *The Woman's Bible* too radical, she found it not radical enough.

Gardener incorporated her suffragist, freethinking views into several novels and wrote for an array of periodicals, from *Popular Science Monthly* to the *Arena* of Boston. After her first husband, Charles Selden Shaart, died, Gardener later married Col. Selden Allen Day. She was pressed into activism as a suffrage leader, at one time acting as chief liaison with President Woodrow Wilson's administration. Although Gardener believed in no miracles, she was credited by coworkers with making them on behalf of woman suffrage.

At age sixty-seven Gardener became the first woman appointed to the United States Civil Service Commission, serving five years with distinction. She died of heart disease at Walter Reed Army General Hospital in 1925. The *New York Times* not only covered her death as major news, but breathlessly reported on her will being carried out. Gardener had bequeathed her brain to Cornell University to set to rest the common bigotry of her day that women's brains were inferior.

In her eloquent, still timely *Men, Women, and Gods*, Gardener noted: "This religion and the Bible require of woman everything, and give her nothing. They ask her support and her love, and repay her with contempt and oppression. I do not know the needs of a god or of another world. . . . I do know that women make shirts for seventy cents a dozen in this one."

ANNIE LAURIE GAYLOR

GAUVIN, MARSHALL JEROME (1881–1978), Canadian rationalist lecturer and writer. Marshall Gauvin was born in Dover, New Brunswick, on May 3, 1881, the eighth of ten (some say eleven) children. He was baptized Marcel, but took on the anglicized Marshall as a young man, and added the middle name later on. His mother, Madeleine Dorion, was a devout Roman Catholic, but his father, Israel Gauvin, had converted to the Baptist faith. Gauvin's youth was spent in a climate of bitter religious acrimony.

During a visit to Boston in 1899, Gauvin became exposed to the FREETHOUGHT lectures of the Rev. J. F.

Bland, a former Unitarian minister and disciple of Robert Green INGERSOLL, whose name he had heard denounced from the pulpit. Influenced by Bland, Gauvin developed a lifelong admiration of Ingersoll and his works. For the next twelve years, he worked as a carpenter for the Intercolonial Railway in Moncton, New Brunswick. His leisure time was spent devouring the works of Thomas PAINE, Thomas Henry HUXLEY, Charles DARWIN, Herbert SPENCER, and others. He also became intimately familiar with the Bible. He would hold single pages of scripture in one hand while continuing to work with the other. In 1909 he wrote his first articles for the American freethought paper *THE TRUTH SEEKER*, a relationship which lasted seven decades.

In 1912 Gauvin left the railway and began his career as a full-time rationalist lecturer (see RATIONALISM). His opponents dubbed him "the Canadian antichrist." He lectured in Toronto and Indianapolis before moving to Pittsburgh in 1914 to lecture for the newly formed Pittsburgh Rationalist Society. Between 1918 and 1920 he toured North America lecturing on behalf of *The Truth Seeker* before taking up a position in Minneapolis for the Twin City Rationalist Society. In 1921 he married Martha L. Becker, herself the product of a German freethinking family. They had one daughter.

In 1926 Gauvin moved to Winnipeg, Manitoba, where he lived for the rest of his life. For fourteen years he was the full-time lecturer for the Winnipeg Rationalist Society, which in 1934 he renamed the Winnipeg Humanist Society. Gauvin finally retired from active lecturing in 1940, noting that the day of the lecturer was over as radio and the cinema were becoming more popular ways to spend leisure time. Between 1921 and 1940 Gauvin gave more than eight hundred lectures.

After spending the war working as a carpenter once again, Gauvin's freethought career seemed once again to come back to life, when he was elected president of the newly formed National Liberal League in 1946. This organization was apparently named in tribute to the nineteenth- and early twentieth-century NATIONAL LIBERAL LEAGUE, which had numbered Ingersoll and other luminaries among its presidents. For much of the next eight years, Gauvin lived in New York trying to build the league. His efforts, though considerable, came to nothing, falling victim to infighting and dissension. In 1954 he returned to Winnipeg. From then until shortly before his death he continued to write for *The Truth Seeker*, although he was increasingly alarmed by the racism and anti-Semitism that was characteristic of the paper at that time. Marshall Gauvin died on September 23, 1978, aged ninety-seven.

BILL COOKE

GAY HUMANISM. During the past two to three decades, various gay humanist and atheist groups have been set up in the UK, the United States, the Netherlands, Norway, and Sweden.

The Gay Atheist League of America (later renamed Gay and Lesbian Atheists, retaining the acronym GALA) was established in San Francisco in 1979. It had a national membership with chapters in several other US cities, and published *GALA Review* bimonthly. Also, at about this time, a gay group was set up under the auspices of the Humanistisch Verbond in the Netherlands (see NETHERLANDS, THE, HUMANISM IN). It published a regular newsletter and arranged some very successful weekend gatherings which were open to all Dutch gays. Later, another group, Gay and Lesbian Atheists and Humanists (GALAH), was established in the United States. This was based in Washington, DC. GALAH held meetings in Washington, San Francisco, and Los Angeles; it published a newsletter, set up a Web site, and engaged in campaigning. Sadly, both of these US groups and the Dutch group eventually folded. The Pink Group was set up in 1992 under the auspices of Human-Etisk Forbund in Norway to provide a forum for gay humanists (see NORWAY, UNBELIEF IN). Nordic Rainbow Humanists was set up in 2000 in Sweden (see SWEDEN, UNBELIEF IN) and has since arranged a number of seminars on humanism and gay rights at international conferences and cultural festivals in Sweden, Finland, Estonia, Latvia, Lithuania, Poland, Croatia, Russia, Macedonia, and elsewhere.

Still very much alive and kicking after twenty-seven years of hectic campaigning and other activities is the UK-based Gay and Lesbian Humanist Association (GALHA). GALHA is a democratically governed and autonomous national/international membership group. It enjoys close, friendly links with kindred UK humanist organizations and is affiliated to Amnesty International and the INTERNATIONAL HUMANIST AND ETHICAL UNION. In terms of longevity, it is an infant compared with the NATIONAL SECULAR SOCIETY and the SOUTH PLACE ETHICAL SOCIETY, both well over a century old, and the BRITISH HUMANIST ASSOCIATION, founded in the 1960s. However, by the standard of lesbian and gay groups, to have thrived for twenty-seven years is no mean achievement—all the more remarkable since, with no external funding, GALHA's administration is carried out and its activities organized on an entirely voluntary basis. It has been sustained financially by its loyal members and supporters.

GALHA was launched in 1979, two years after Mary Whitehouse, a self-appointed guardian of the nation's morals, brought a successful private prosecution for blasphemous libel against *Gay News*—then the UK's

only gay newspaper (see BLASPHEMY). Whitehouse, a committed Christian, became the target of vociferous protest—not least from the National Secular Society, which had been campaigning for years for repeal of the blasphemy laws. She began declaring in public that "everything good and true" that "every decent person believes in" was being undermined by "the humanist gay lobby." This was enough to set a few gays in the humanist movement thinking: Although any such lobby was just a figment of Whitehouse's imagination, perhaps it would be a good idea to set one up.

An ad hoc committee of six met to discuss the possibility. They included Jim Herrick, now a very well-known figure in the international humanist movement and former editor of *New Humanist* magazine, and Barry Duke, the current editor of the *FREETHINKER*. A threefold agenda was settled on: to make gay people aware of the gay-friendly humanist ethical outlook; to further an awareness among heterosexual humanists of the widespread prejudice and discrimination suffered by gays while encouraging their support; and to play a part in the ongoing campaign for gay and humanist rights.

At the 1978 conference of the Campaign for Homosexual Equality (CHE, then the leading UK gay rights organization), the ad hoc committee set up a humanist information stall and held a meeting to assess possible interest in a gay humanist group. Having decided to go ahead, the committee had leaflets printed and a large number were distributed in London's Hyde Park at the start of the Gay Pride march in June 1979. This was exceptionally well attended (for that time) by eight thousand people. The march outreach generated sufficient publicity and interest that a formal launch meeting was held in August 1979 during CHE's conference in Brighton. The conference attracted about six hundred participants.

At the inaugural meeting, the decision was taken to form the Gay Humanist Group (GHG). The keynote speaker at this meeting was Bill McIlroy, a former general secretary of the National Secular Society, who had already served one term as editor of the *Freethinker*. He sounded a warning that the gay movement's small gains made within the previous ten years "could quite easily be wiped out as a result of the growing influence of evangelical Christians in the corridors of power." No doubt he had in mind the Nationwide Festival of Light—later to become Christian Action, Research and Education (CARE), which, together with the Christian Institute, is very active today lobbying against lesbian and gay rights.

Those attending the CHE conference had not long to wait before the sort of hostility Bill McIlroy referred to became evident. A half-page advertisement appeared in the *Brighton Evening Argus* sponsored by twenty-two local Christian clergymen, who stated their strong opposition to the town's hosting the conference. The founding members of GHG were in the vanguard of protest against this hostility, taking part in a demonstration outside the church of one of the clergy responsible. This would be the first of many such "direct actions" taken by the group over the following years. Nowadays, such direct action is associated almost exclusively with the UK group OutRage! and such US organizations as Queer Nation; many younger lesbians and gay men in the UK remain unaware of the courageous demonstrations that took place (and in which GHG participated) years before OutRage! was founded.

In addition to the 1979 protest in Brighton, GHG demonstrated on the occasion of Pope John Paul II's visit to Britain in 1982, when it launched POPE (People Opposing Papal Edicts); the group organized or participated in protests throughout the 1980s in locales including Rugby; Nottingham; Wombourne, Staffordshire; and Manchester. GHG displayed a clear early commitment to direct action, and it can confidently claim to have played a part in helping to further the cause of lesbian and gay equality.

In 1987 the GHG was renamed the Gay and Lesbian Humanist Association (GALHA). About this time campaigns to organize letter writing on issues of gay and humanist concern, already in place during the GHG era, were more stringently organized. A postal action plan was launched involving a substantial number of GALHA members. This facilitated substantial lobbying of MPs, government ministers, commercial firms, and the media on dozens of issues relating to gay and humanist rights. Many submissions have been made to government bodies on such issues.

In 1987 a humanist "affirmation" ceremony of love and commitment was devised for same-sex couples as *the* alternative to the gay Christian "blessing" (a non-legally binding attachment ceremony performed for gay couples by a progressive-minded priest, often one who is gay himself). With the help of celebrants affiliated with the British Humanist Association and the Scottish Humanist Society, affirmations have been held in all parts of the country from Aberdeen in the north to the Channel Islands in the south. Part of the ceremony was depicted by a television program aimed at teenagers, which featured the first gay kiss on British television, provoking outrage from Whitehouse and other Christian morality campaigners. In 1992, with the voluntary assistance of gay lawyer Peter Ashman, GALHA set up a registered charity, the Pink Triangle Trust, which later took over the arrangement of the ceremonies.

GALHA has held regular public meetings in London since its founding. Thanks to the friendly welcome given by the South Place Ethical Society, which owns the Conway Hall Humanist Centre in central London, these meetings have invariably been held in the hall's library. They have been addressed by a wide range of speakers from the gay and humanist movements. Some very popular forum meetings have also been arranged, including several political forums preceding general elections.

From time to time over the past twenty-seven years, GALHA has provided speakers about its activities and the humanist outlook to other gay and lesbian groups, including university LGB societies, and on lesbian and gay rights to humanist groups in various parts of the country. It has also provided information on humanism and its stance on gay rights to many pupils and students doing projects.

The organization's publishing activity began with a six-page newsletter issued in November 1979 by the GHG. The publication continued as a newsletter until 1983, when it was upgraded to a small magazine featuring news, features, and reviews. Beginning in 1990, it became a full-size professionally printed magazine which is now entitled *Gay Humanist Quarterly*. It is issued free to GALHA members and has subscribers in the UK, other European countries, and the United States. In late 1993 GALHA turned over the publication to the Pink Triangle Trust. Titled *Gay & Lesbian Humanist* but now publishd again by GALHA with the title *Gay Humanist Quarterly*, it is issued free to GALHA members and has subscribers in the UK, the United States, and other countries.

As for the future, as the UK Labour government grants more and more privileges to religionists—granting them exemption from employing gays in its employment regulations, funding an increasing number of faith schools, failing to introduce gay marriage for fear of religious opposition, and kowtowing to homophobic Muslims—it seems that GALHA will still be providing a useful role as a campaigning group for LGBT and humanist rights for some years to come.

GEORGE BROADHEAD

GERMAN LITERATURE, UNBELIEF IN MODERN (1700–1900). The term *unbelief* implies primarily the rejection of any supernatural being, and "modern German literature" refers to all writers and thinkers who wrote most of their major works in German between 1700 and 1900. Therefore writers like Thomas Mann, Robert Musil, Franz Kafka, Gottfried Benn, and Bertold BRECHT, who were born before 1900 but completed their major works after 1900, will not be dealt with.

Winckelmann. One of the central reasons for German writers and thinkers to doubt the existence of a supernatural world is the fact that ancient Greek culture was regarded as a cultural ideal in Germany. One person in particular helped to shape the German understanding of ancient Greek culture: Johann Joachim Winckelmann, who held: "The only way for us to become great or even inimitable if possible, is to imitate the Greeks." His two most important works were the *Geschichte der Kunst des Altertums* (History of Ancient Art, 1764), in which he gave a detailed description of specific works of ancient Greek art; and the *Gedanken über die Nachahmung der griechischen Werke in der Malerei und Bildhauerkunst* (Reflections on the Imitation of Greek Works in Painting and Sculpture, 1755), by means of which he provided the nineteenth century with a philosophical understanding of ancient Greek culture. According to Winckelmann, ancient Greek culture, in particular the sculptures, is based on "noble simplicity and quiet grandeur." The Greeks were supposed to have had an inborn sense and longing for beautiful Olympian forms.

Lichtenberg. The first significant modern German writer and thinker in whom one can directly find aspects of antireligious reflections is Georg Christoph LICHTENBERG. His most noteworthy writings are his *Sudelbuecher* (The Waste Books, 1765–99), which is a collection of his notes and aphorisms published directly after his death. Most of his theological remarks were directed against both the teachings of the church and the institution itself, for he thought that the expansion of reason was hindered by the church. However, one can also find ideas in his writings in which the existence of a supernatural being is doubted. He remarked that the phrase "God created human beings according to *his* image" most probably means that human beings created God according to their own image, and that he thought the world will one day be so refined that it will be as ridiculous to believe in God as it is to believe in ghosts. Although the cited phrases could imply that God is nothing but a human invention, other remarks in his work imply that Lichtenberg was never able to transcend his belief in the existence of God.

Goethe. Only seven years younger than Lichtenberg was the most influential German writer and one of the founders of German culture: Johann Wolfgang GOETHE. By some, he is seen as a modern Christian, by others as a pantheist or panentheist, and still others praise him as a defender of paganism. During the nineteenth century he was seen principally as a despiser of religion. Goethe was brought up in the Lutheran tradition, but as a student he severed his bonds with the church. Particularly dominant aspects of his work are his sympathy toward pagan antiquity and his focus on what it means for human beings to live a good life in this world. These topics play a particularly significant role within his *Iphigenie* (1786) and *Wilhelm Meisters Lehr- und Wanderjahre* (Wilhelm Meister's Apprenticeship and Travels, 1777–1829). Goethe declared himself a disciple of Baruch SPINOZA, who stressed the unity of the world and the divine aspect within the whole of nature. It must be noted that he rejected both materialism and the idea of a solely transcendent spiritual God. He also rejected an ethics that denies the polarity within human nature. Evil, according to him, is the privation of goodness, and in one of his letters he stresses that, like nature, he wishes to be good and evil. If nature is good and evil, then the universe and human beings are also bound to be both. Toward the end of his life, he seemed to develop a higher estimation of Christianity again, but even then he does not seem to abandon his belief that all it amounts to is a divine nature which is completely this-worldly.

Weimar and Jena. During Goethe's time was the golden age of German thinking and writing, with all the authors of Weimar classics like Johann Paul Friedrich Richter (known as JEAN PAUL), Johann Christian Friedrich Hölderlin, and Johann Christoph Friedrich von Schiller; the romantic writers like Georg Philipp Friedrich Freiherr von Hardenberg (known as Novalis); and idealist philosophers like Immanuel KANT, Friedrich Wilhelm Joseph von Schelling, Johann Gottlieb FICHTE, and Georg Wilhelm Friedrich HEGEL. Besides Kant, all of them were based in the region of Jena and Weimar at least during some period of their lives. Most of them can still be regarded as Christians. It is only the philosopher Johann Gottlieb Fichte and the writers Jean Paul and Johann Christian Friedrich Hölderlin who have to be mentioned in this survey. Fichte was accused of ATHEISM, and as a consequence was dismissed by the court of Weimar (see CONTROVERSIES: SPINOZISM, ATHEISM, PANTHEISM). Within his *Ueber den Grund unseres Glaubens an eine goettliche Weltregierung* (On the Grounding of our Belief in a Divine World Order, 1798), he referred to God as nothing but the active and living moral order of the world, without God being a specific thing or substance. Later in his life he altered this position and identified God with the infinite, absolute world ego. Another aspect of his philosophy can be seen as crucial, for he regarded philosophy as the result of one's own personality. According to him, which philosophy one chooses depends on one's personality. The idealist philosophers represent the intellectual background for both the Weimar classicists and the later romantics. Jean Paul's relationship toward Christianity cannot be described unambiguously, either. That there are significant skeptical elements in his belief system becomes apparent in one chapter of his novel *Siebenkaes* (1796–97), which bears the title "The Dead Christ Proclaims from the Top of the World Edifice That There Is No God." Here he deals with the problem of NIHILISM as a consequence of free subjectivity. Like Jean Paul, Hölderlin can be seen as belonging neither to the classicist nor the romantic tradition, although one can find elements of both traditions in his writing. Hölderlin's works mainly deal with the gods and myths of the ancient Greek religion, as he saw the Greek gods as true and living forces in this world. He had studied theology, but he could not see himself becoming a Lutheran pastor, for he was deeply embedded in this world. This becomes particularly clear in his ode *Die Heimat* (The Home, 1800), in which he writes the following lines: "For they who lend us the heavenly fire, the Gods, give us sacred sorrow too. Let it be so. A son of earth I seem; born to love and to suffer." He died after having spent the last thirty-six years of his life insane.

Kleist. Heinrich von Kleist died at the age of only thirty-four. His inner conflicts led him to commit suicide by shooting himself. In his farewell letter, he referred to his own life as the most painful a human being has ever had to endure. His life and work represent the ambiguity of the modern self and the awareness of a fragmented world. Originally, Kleist had a rationally worked-out plan for his life, which he tried to follow in an exaggerated manner. After reading Kant, he came to the conclusion that in this world it is impossible to grasp the truth as corresponding with the world, which brought about a significant crisis in spring 1801. It is this crisis that turned Kleist into a poet. As mysterious as Kleist's life were his works, in which disturbing figures like Penthesilea and Michael Kolhass turn up who are puzzled by God. Extreme personalities, raw passions ungovernable by reason, and a complex description of psychological states are significant elements of his writings.

Schopenhauer. The fundamental drives are of central relevance not only in the life of Kleist, but also in the philosophy of Arthur SCHOPENHAUER. The whole world is nothing but a blind and permanently striving will, and human beings are appearances of this will with individuated personal wills. As the wills strive all the time, each will always has to overcome other things. Overcoming is painful. Therefore, striving always implies the experience of pain. The prevailing presence of pain is one reason for Schopenhauer to reject the Judeo-Christian God, as he thought human beings experience so much pain on earth that this situation would have to be unbearable for a God who had created the world. In addition, he put forward more reasons why he regarded Christianity to be misleading. Christians hold that human beings have an immortal soul, but animals do not, and therefore are things, which is the reason why human beings are separated from the animal kingdom. According to Schopenhauer, human beings fundamentally belong to the animal kingdom. Religions in general come about due to ignorance, and Schopenhauer advocated not giving lessons in religion to children before the age of fifteen.

Heine. In contrast to Schopenhauer, who put forward an ascetic lifestyle, Heinrich HEINE did the opposite. He has to be seen as a herald of the emancipation of the flesh who identified revolution with a bacchanal, as he was significantly influenced by Saint-Simon. Consequently, it is unsurprising that he had a rather negative attitude toward Christianity. However, it cannot be said about him that he was indifferent to religion. He himself claimed that God was the beginning and end of all his thoughts. Even though he appeared to be sentimental, satirical, and frivolous, a nondogmatic religiosity was a significant part of his character. His origins were Jewish, but in 1825 he converted to Protestantism.

Feuerbach. Seven years younger than Heine was the philosopher Ludwig Andreas FEUERBACH. Feuerbach tried to reduce the content of religious faith to its psychological roots, so that all theology turns into anthropology. However, he did not regard religion to be a worthless illusion, rather holding that religion is the dream of the human spirit and the human consciousness

of an infinite being. The divine being represents the nature of a human being, objectified as a separate being but without his limits as an individual person, and in particular without all their weaknesses and their repulsive elements. The qualities of God are constituted out of the wishes, emotions, and desires of human beings, and so are all the basic dogmas of Christianity. Faith contains what is holy for human beings. Though Feuerbach analyzed all aspects of religion as being reducible to anthropological elements, he recognized valuable elements within religion, such as the love of humanity and love toward the pure nature of human beings. Love is seen as the essential element for human salvation, as love enables the finite world to be dissolved in the infinite, and truth is essentially connected to love, too. It has to be stressed that Feuerbach did not want to get rid of religion, he merely separated it from the relationship with God. Religion does have the potential to heal the inner conflict of human beings. However, God should be replaced by the human race and the afterworld by the future of humanity.

Stirner. The philosopher Max STIRNER, pseudonym for Johann Kaspar Schmidt, regarded Feuerbach as his major opponent and criticized him for being too religious. Stirner was one of the most radical defenders of individualism, and according to him even Feuerbach's humanity is something fictitious, for anything abstract, ideal, and general does not exist. All these notions are mere inventions of human beings in order to promote themselves. The only real thing is the ego; others and things are only valuable if they serve or satisfy the ego. I am everything, and everything I need is my property and is there for me, Stirner held: "Divine things are God's concern, human things the concern of human beings. Neither what is divine, nor what is human, nor the truth, the good, the right, the free and so on, but only my things are my concern. . . . There is nothing more important than myself." Stirner regarded himself as the absolute, the perfect, and the only thing, with the world being his own creation and the society as nothing but a company of egoists. In contrast to Kant, who held that one should never treat any human being solely as a means to a further purpose, this is exactly what Stirner demanded. Not only did he regard human beings as means for his own purpose, but also all other things, and plants, and animals. Stirner can be seen as the defender of an extreme type of anarchy. According to him, even atheists are pious people, as they believe in the human, order, and the future.

Büchner. In contrast to Stirner, Georg BÜCHNER attributed far greater importance to other people. Like Schopenhauer's, his thinking was based on the fundamental insight that life means nothing but pain. It was Büchner's goal to transcend this pain and to help others to transcend it. He was particularly acquainted with all aspects of human suffering, as he was a medical doctor, as had been his father also. Within his novella *Lenz* (1842), the hero is on his quest for a religious meaning for all the suffering and pain. In order to reduce suffering on a social level, Büchner cofounded a secret society for human rights in the spring of 1834, the goal of which was to establish a republican and egalitarian society. Even while a school pupil, Büchner was fascinated with the French Revolution. He was particularly keen on strengthening the interests of the working class compared with the interests of the liberal middle class.

Marx. Karl Heinrich MARX's goals concerning an ideal society were similar to Büchner's. However, his account was theoretically more detailed, and his actual influence more effective. His theory focused primarily on the economic well-being of citizens: "It is not the consciousness of men that determines their being but, on the contrary, their social being that determines their consciousness." By social being, he referred mainly to the economic class to which someone belongs. Analogous to Marx's understanding of society is his understanding of religion: "Just as religion does not create man, but man creates religion, so the constitution does not create the people but the people the constitution." Like Feuerbach, Marx held that the qualities attributed to God are a collection of human wishes and desires. In consequence, he came to the conclusion that "the abolition of religion as the illusory happiness of the people is a demand for their real happiness. The demand to give up the illusions about their condition is a demand to give up a condition that requires illusion. The criticism of religion is therefore the germ of the criticism of the valley of tears whose halo is religion."

Haeckel. Marx acknowledged the immense importance of Charles DARWIN, as did Ernst HAECKEL, who was the main defender of Darwinism (see DARWINISM AND UNBELIEF) in Germany. Besides Darwin, Haeckel held Goethe in high esteem, particularly concerning his understanding of the world. Haeckel's worldview was strictly monistic, whereby body, spirit, matter, and energy are all qualities of the one, universal substance (Hylozoism) which is also eternal, infinite, and unlimited. All atoms can perceive and strive. God, according to Haeckel, could only be described as the sum of all natural forces. Yet there is nothing outside of or additional to nature, and, therefore, there is no difference between pantheism and atheism (see PANTHEISM AND UNBELIEF). In one of his monographs, he described monism as the connection between religion and science. Haeckel also cofounded the German Monist Union. As a consequence of his conviction that everything which exists belongs solely to this world, he was a fierce opponent of dualism, theism, and spiritualism, and he held that the dogmas of all positive religions have to be rejected. However, human beings are social vertebrates, and both egoism and altruism are basic constituents of human nature. Morality, according to Haeckel, does have a bio-sociological basis.

Nietzsche. Another defender of monism was

Friedrich Wilhelm NIETZSCHE. According to him, the world is will to power, meaning that it is constituted out of quanta who are permanently trying to overcome themselves. However, his unbelief in any transcendent world, and in particular in a Christian God, not only becomes obvious in his own immanent worldview but rather in various types of complex, clever, and witty criticisms he put forward. One can distinguish at least three types of criticism: the genealogical, the perspectival, and the depth-psychological critique. By means of the genealogical approach, he tried to make Christianity unappealing by putting forward an account of how Christianity and Christian morality in particular came about. In this way, he could not prove the falsity of Christianity, but he was able to advertise a different morality and convince the reader that Christianity has to be associated with qualities that are unpopular among human beings. Nietzsche described how in late antiquity Christianity grew more and more influential among slaves. With the notion of "slaves," he referred not only to actual slaves, but also to weak, ill, and ugly people. The invention of Christianity can be traced back to the will to power of the slaves, and Christianity is the tool of the weak to gain power, according to Nietzsche. As no one wishes to be associated with the ugly, the weak, and the ill, and in Nietzsche's writings a strong case is put forward for associating these undesirable characteristics with Christianity, Christianity gradually becomes less popular. By means of the perspectival critique, Nietzsche provided us with alternatives to generally accepted positions, so that the contingency of widespread, popular positions becomes plausible. In this way, he laid open that the equality of human beings, which is connected to the assumption that all human beings have a soul, is not a theory which has to be taken for granted, for in ancient Greece it was common to distinguish between the moralities of slaves and noblemen. By means of his depth-psychological arguments, he tried to reveal hidden motives of types of human beings. He was particularly convincing in the case of priests, as well as that of common believers. By showing that their beliefs and actions can also be explained by egoistical motives, he convinced many readers that their motives actually are the egoistic ones, as egoistic motives often appear as more plausible than other more upright ones.

Further Writers. Some slightly less important authors who also belong to the history of unbelief in modern German literature are the following: Luis Charles Adélaïde de Chamisso de Boncourt (known as Adelbert von Chamisso), Christian Dietrich Grabbe, N. Franz Niembsch Edler von Strehlenau (known as Nikolaus Lanau), Karl Gutzkow, Wilhelm Richard Wagner, Georg Herwegh, Gottfried Keller, Gerhart Hauptmann, Benjamin Franklin Wedekind (known as Frank Wedekind), and Stefan George.

GERMANY, UNBELIEF IN. The division of religious people for legal purposes according to different religious denominations reflects the incomplete separation of church and state typical of Germany. For example, church taxes are collected by Germany's Ministry of Finance according to the denomination to which each taxpayer claims to belong. Approximately 7.5 billion euros per year are paid to the churches by government each year.

Following World War II, Germany's religious and ideological diversity increased. Within a total population of 82.5 million inhabitants (*Statistical Yearbook of the Federal Republic*, 2003 figures) figures compiled by REMID (Religionswissenschaftlicher Medien-und Informationsdienst/Science of Religion Media and News Service) show that there are 26 million Protestants, 26 million Catholics, 3.2 million Muslims, 1 million Orthodox (Russian, Greek, Ukrainian, and other), 200,000 Jews, 150,000 Buddhists, and 100,000 Hindus. Another 500,000 to 850,000 claim affiliation with smaller religious communities (for example, 165,000 Jehovah's Witnesses).

The number of people who report belonging to none of the above-mentioned religious groups has grown quite large: approximately 25 million. This unaffiliated group, nearly the same size as the Protestant and Catholic groups, is frequently spoken of as a "third denomina-

tion." Although avowed atheists (see ATHEISM) do not form the majority among the unaffiliated, atheism is gaining in importance, especially in eastern Germany, where explicit atheists comprise 20 percent of the population. There, despite German unification, sociologists predict that atheism will be dominant nationwide in four generations. On every index the gap in religious identification between east and west is very sharp. In the west the unaffiliated form 12 to 15 percent of the population; in the east they amount to 65 to 75 percent. In western Germany 70 percent of the population claim membership in some church, compared to only 24 percent in the east. In the west approximately 15 percent of residents attend church weekly, in the east a mere 3 percent. In addition, the proportion of religious believers tends to decrease among younger age groups. A consensus public "civil religion" as is commonly expressed in the United States does not exist in Germany.

Humanism and Freethought in Germany. A recent study indicates that 7 percent of the population strongly supports a humanistic viewpoint (see HUMANISM) without being connected to any religion, and an additional 42 percent does so to a lesser extent. While the number of Germans affiliated with formal humanist and freethought groups has declined, the number of secular officiants able to perform humanist services such as weddings and memorial sevices has risen, tracking the increase in the unaffiliated population. Today, approximately twenty to fifty thousand people are members of various humanist or FREETHOUGHT associations, so-called LIFE STANCE organizations that are nonreligious but serve some of the same social needs as churches. This is about the same number of Germans who belonged to nonreligious organizations prior to World War I.

Unbelief in Modern Germany. The first democratic nonreligious life stance associations were founded five years before the revolution of 1848–49. Their members were dissidents or renegades who thought of themselves as free religious (*freireligiosen*), which is to say practicing free thought within the religious community. The spread of the ideas of Charles DARWIN and later Karl MARX in the second half of the nineteenth century led first to liberal, then to social democratic freethinking associations such as the Deutscher Freidenkerverband (German Association of Freethinkers), founded in 1881 (see EVOLUTION AND UNBELIEF; MARXISM; SOCIALISM AND UNBELIEF). Additionally there were numerous cultural and fraternal societies, many with connections to freethinking Germans who had emigrated to the United States, whose programs included a secular approach to spiritual welfare, moral instruction, and education. As noted, participation in nonreligious life stance organizations was strong before World War I, but grew rapidly thereafter. By the end of the 1920s nearly 1 million people were organized in nonreligious and freethinking associations. In 1933 most associations were forbidden by the Nazis and their property dispossessed. While a handful of nonreligious accepted racist fascism, it is widely understood that former freethinkers formed the majority of active resistance fighters. After the war ended all the freethought organizations that existed in the 1920s were reconstituted, but they failed to capture broad popular support and eventually collapsed. There were various social and political causes for this. In the west, a rapid expansion of individualism since the 1980s lessened the appeal of fraternal and social organizations. The close organizational connections that the traditional nonreligious organization had enjoyed with traditional worker's parties and political liberals lost relevance. In addition, as the Cold War had split Germany itself, all of the freethinking organizations suffered an east-west split. In the former East Germany, atheism was state policy and no autonomous freethought movement was permitted. By the time the Berlin wall fell, the remains of the freethinking movement had become insignificant.

German Humanism: A New Beginning. Since 1993 the Humanistischer Verband Deutschlands (HVD; Humanist Asssociation of Germany) has tried to spark a new beginning, offering a spectrum of human services including social work, nursery schools, ethics curricula for schools, coming-of-age celebrations, secular funerals, get-togethers for senior citizens, living wills, and support for voluntary euthanasia, among other projects. Furthermore, the association strives to link the theoretical and political content of atheism with the ideals of liberal and social democracy. In Berlin and other large cities in Germany, this has been successfully accomplished. At present, the HVD has approximately ten thousand members. Humanists view their life stance not as a "religious belief" but rather as a "scientific worldview." This point of view and its implications are summarized in the following list of concepts, all of which are vital to describing the way humanists see themselves:

- Indifference toward any god
- Trust in one's own cognition and empirical science
- Rejection of beliefs in redemption, rebirth, and resurrection
- Respect for individual uniqueness and human rights
- Self-determination as a primary value
- Secularity, insofar as is possible, of all matters regarding public life
- Solidarity, tolerance, and communication with fellow human beings
- Criticism instead of belief as a general principle

GIBBON, EDWARD (1737–1794), English historian. Edward Gibbon is best known for his seven-volume (in most editions) history *The Decline and Fall of the Roman Empire*, which treats the period from the second century to the fifteenth century CE. The work has two parts. The first covers the history of the empire in the west to its end in the last decades of the fifth century. The second part covers the one thousand years of what we now call the Byzantine Empire, the last vestiges of which were conquered by the Turks in the fifteenth century. Gibbon's theme was the decline of political and intellectual freedom that he found in classical literature of the past; he is particularly unsympathetic to the Byzantine Empire. Today his work is regarded as one more of literature than history, in light of two centuries of scholarship on the subject since his time. His sources were primarily the Latin and to a lesser extent the Greek works then known, and these have since been supplemented by archaeological findings, the use of inscriptions, writings in languages other than Latin or Greek, and thousands upon thousands of monographic studies on every aspect of the period on which he wrote. Even in his own time, the second section of the book had serious omissions in his narrative and often unsatisfactory summaries, perhaps because Gibbon was not as facile in Greek as he was in Latin. Though he says he wrote to vindicate intellectual freedom, he concluded toward the end of his work that he had ended up describing "the triumph of barbarism and religion." Historically, Gibbon is particularly important to rationalists (see RATIONALISM) and freethinkers (see FREETHOUGHT) because of his insistence that religion in the Roman Empire, particularly Christianity, be subject to the same kind of historical inquiry to which Roman history itself was.

Gibbon came from a wealthy background and always had an independent income. His problem was what to do with his time and energy, and he early on decided that history was "his proper food." Though sickly as a child, he seemed to recover at puberty and remained in more or less good health throughout his life. He entered Magdalen College, Oxford, on his fifteenth birthday, where he became interested in theology and, as one biographer said, "read himself" into Roman Catholicism, to which he converted a year after going to Oxford. His father almost immediately removed him from the college and sent him to Switzerland to study with a Calvinist minister, Daniel Pavillard, under whose guidance he studied classical literature, French, mathematics, logic, and within a year had once again become a Protestant. He also fell in love, but his father opposed his engagement; he broke it off and never married.

While in Switzerland he made the acquaintance of VOLTAIRE and other figures of the French Enlightenment (see ENLIGHTENMENT, UNBELIEF DURING THE), and on his return to England upon the death of his father, he joined English intellectual society, including membership in the Club, the circle of friends around Dr. Samuel Johnson, where he became intimate with Joshua Reynolds and David Garrick. He also served briefly in Parliament and in the South Hampshire militia. He published the first volume of his history in 1776; it was both successful and controversial, as it dealt with the rise of Christianity. His fifteenth and sixteenth chapters were attacked by many pamphleteers and subjected to ridicule, most of which he ignored, except for those that accused him of falsifying his evidence; to these he felt it necessary to reply. He also served for a time as a commissioner of trade and plantations, and for a time debated with himself whether to finish his magnum opus or concentrate on a political career. When he lost his paid position as commissioner, he moved to Lausanne in Switzerland to economize, and there he finished his writing of the *Decline and Fall*, all volumes of which had been published by 1788. He also wrote a memoir of his life and many other works. He returned to England in 1793 and died in 1794.

His "exposure" of the crimes and futility of Christianity have led many freethinkers to call him one of their own. Certainly, his treatment of Christianity in his own lifetime led him to be attacked and ridiculed by many of his contemporaries, who feared that his skepticism would shake the existing church and government establishment. In the nineteenth century, agnostics (see AGNOSTICISM) seized upon him as one of their own. He himself was not a particularly militant nonbeliever, and regarded himself as a historian who treated religion as a phenomenon of human experience. He did not believe in divine revelation and had little sympathy for those who did. Joseph MCCABE in his study *Free Thinkers* labeled him a deist on the way to agnosticism, and Gibbon's chapters on early Christianity are still worth reading today. In fact the whole book makes for a good read, and his insistence that early Christianity should be subject to the same critical studies as the secular classical literature makes him particularly important for freethinkers and rationalists everywhere.

VERN L. BULLOUGH

GIBSON, ELLA E. (1821–1901), American feminist, freethinker, and Bible critic. Ella E. Gibson was apparently the first freethinking woman to write a feminist analysis of the bible, *The Godly Women of the Bible, by an Ungodly Woman of the Nineteenth Century* (c. 1878). The Truth Seeker Company published *Godly Women* and apparently kept it in print for the next thirty years, but today it is a rare artifact.

Gibson was born in Winchendon, Massachusetts, taught public schools for twelve years in New England, and also wrote and lectured. She organized Soldiers' Ladies Aid Societies in Wisconsin at the start of the Civil War, then joined the Eighth Wisconsin Volunteers, where she was elected chaplain of the First Wisconsin Regiment, Heavy Artillery. Her appointment was apparently approved by President Abraham Lincoln on November 10, 1864, but the secretary of war refused to muster her because she was a woman. By an act of Congress on March 3, 1869, payment for her services as a chaplain was approved, but she did not receive a pension until 1876.

By that time, Gibson was an outspoken freethinker, and much of her government pension went into the freethought cause. Although a bout of malaria during the war reduced her to frequent invalidism, Gibson kept her pen active, often writing from her sickbed. Freethought biographer Samuel P. PUTNAM noted that Gibson wrote for nearly every "Liberal" (freethought) newspaper in the United States, as well as editing the *Moralist* in 1891. Gibson also wrote *The Holy Bible Abridged* and various pamphlets.

Gibson took a more outspoken and less euphemistic approach in describing the Bible's treatment of women than did Elizabeth Cady STANTON, whose classic look at the Bible, *The Woman's Bible*, was published in the late 1890s. In the conclusion of her work Gibson prophesied: "The time will come when King James's Bible (present version) will not be spoken of without a blush of shame tingling the cheek of modesty, or referred to except as a textbook obsolete, superannuated, blasphemous, false, pernicious, corrupt, immodest, obscene, and too immoral to be tolerated, even as a past nuisance, ancient, foreign, and worthless."

She wrote of the Bible: "Away with its false teachings, fables, pagan mythology, and abuse of woman, and assist her to free herself from these shackles and to overcome these vile aspersions descending down from the dark ages and settling like a pall over her existence and the existence of the race!"

Gibson died at age seventy-nine in Barre, Massachusetts.

ANNIE LAURIE GAYLOR

GILMAN, CHARLOTTE PERKINS (1860–1935), American feminist, evolutionist, and author. Charlotte Perkins Gilman, an internationally recognized humanist (see HUMANISM) and social critic, wrote dozens of books and hundreds of articles and gave thousands of lectures, all in an effort to understand the world in order to change it fundamentally.

The restructuring of relations between men and women was the central focus of her radical vision and the central theme of her most famous book, *Women and Economics: An Examination of the Relationship between Men and Women as a Factor in Social Evolution* (1898). The book had an immediate and enormous impact. The world is masculinist, she declared, and she wished to create an equitable balance between men and women. Only in the human species, unlike other animals, does the female depend on the male for food. Thus, the sex relationship is also an economic one. Women, narrowed by their subjugated position in society, must be freed from their domestic place in order to improve society as a whole. Gilman called for economic independence for women, which in her vision included kitchenless homes, professional child rearing, and communal dining (see SEX RADICALISM AND UNBELIEF). It is true, however, that Gilman did not challenge some of the major views prevalent in her lifetime, such as racism and xenophobia.

Important as *Women and Economics* was, and continues to be, it was only the first step in Gilman's ambitious project. In *Concerning Children* (1900), she asserted that damaging childrearing ideas resulted from treating children only as parts of a family instead of as members of society. *The Home: Its Work and Influence* (1903) followed soon thereafter. Gilman indicted "an institution owned by man, in which wife and children are forcibly held, forcibly by virtue of economic dependence and ideological pressure." In *The Man-Made World, or Our Androcentric Culture* (1909), a study of "excessive maleness," she analyzed the kind of mischief that occurs when one sex dominates the other. The best known of her works today, "The Yellow Wall-

paper" (1892), protests the mistreatment of women suffering from depression subjected to the medical profession's "rest cure."

In *Our Brains and What Ails Them* (1912), she asked the question: With our vast knowledge, why are humans "the most vicious, the most unhappy, the sickest beast alive?" In her last book (except for her autobiography), *His Religion and Hers: A Study of the Faith of Our Fathers and the Work of Our Mothers* (1923), Gilman answered that question and the others she had posed throughout her life. The first book explored the economic relations between men and women. At the end of her life Gilman summed up her work with a study of the power of ideology—isolating religion as a central part of the human ideological system.

Gilman was a Beecher, and the Beechers were the most famous family in America. Lyman Beecher, her great-grandfather, still living when Gilman was born, was a zealot and evangelist, setting as his goal in life to regenerate society through his Christian teaching. All the Beecher men became ministers. The Beecher women, though banned from the ministry, created their own ministerial version, as educators, writers, or activists. Harriet Beecher Stowe, author of *Uncle Tom's Cabin*, was one of Charlotte's aunts. Another, perhaps more famous at the time, was Catherine, who effectively persuaded her generation that the home was the nation's moral center. She idealized the idea of domesticity with maternal self-sacrifice at the core. Gilman stood Aunt Catherine on her head by challenging the prevailing ideology of domesticity, as she did in *Women and Economics* and subsequent books. But she turned the entire Beecher clan on its collective head by asserting that religion, which defined the life of her prominent ancestors, has done more disservice to humanity than any other institution or any other ideology.

"Religion is the strongest modifying influence in our conscious behavior," she wrote, and it should serve our best interests, but it does not. It focuses on worrying about putting souls in heaven rather than concerning itself with this life. That we suffer so much on earth is not god's fault or the devil's fault, but our own. A life in heaven is appealing because it exists in the imagination as a fantasy about which we have no knowledge and feel no responsibility. The real future is the world we leave behind. Religions are concerned with the beyond for each individual after death, instead of human life as one generation is replaced by the next.

We are also burdened with another aspect of dominant masculinity, "the guileless habit of blaming women."

To believe and to obey are the chief demands of religion. What "the fathers" saw and thought was probably the best they could manage at the time, but to force their limited vision on those who come after is endlessly damaging. Such is "his" religion. In Gilman's view, women are oriented toward birth, not death, toward creation—creating agriculture, while men hunted—and nurturing the young. The human race lives immortally on earth, endlessly re-created through birth. Social improvement is our chief duty. What we call god is the life within us. Gilman took the nineteenth-century notion of maternal service and made it the foundation of a benevolent nonreligious ethical system and guide to human conduct.

ANN J. LANE

GODWIN, WILLIAM (1756–1836), British writer, philosopher, and novelist. William Godwin had a strongly religious childhood. His father was a Dissenting minister, belonging to a sect that refused subscribe to the Thirty-nine Articles of the Church of England. He underwent rigorous training for the ministry under a strict Sandemanian, a member of a hyper-intellectualist sect that damned the vast majority of those John Calvin deemed saved, followed by three years at the Hoxton Dissenting Academy and a brief spell as a minister (from which he published a collection of sermons). Despite it all Godwin came to abandon his religious beliefs in his late twenties, ascribing his DEISM and ultimate ATHEISM to the works of the philosophes, especially Baron d'HOLBACH, Claude Adrien HELVETIUS, and Jean-Jacques ROUSSEAU, and to conversations with friends. The only explicit attack on religion that he published was *The Genius of Christianity Unveiled*, his final work, left for posthumous publication, which provided a thoroughgoing critique of Christian belief. Yet his heterodox opinions were clear to his critics from the first publication of his major work, *An Enquiry concerning Political Justice* (1793), and from the later notoriety generated by his candid *Memoirs of the Author of the Vindication of the Rights of Woman* (1798), his heartfelt, if unwise, tribute to his wife, Mary WOLLSTONECRAFT. Yet for all that *Political Justice* espoused a secular mixture of utilitarianism and DETERMINISM, it retained a central emphasis on the right and duty of private judgment and advocated a highly intellectualized view of the nature of pleasure, both of which

owe much to his background and friendships in rational Dissent. While later editions diminished his rationalism, confidence in truth, and repudiation of the private affections, private judgment remains central both to his moral philosophy and to his final denunciation of the imposture of Christianity.

Life. The seventh of thirteen children, Godwin was trained for the ministry at his own insistence from the age of eleven, and he stubbornly held to the extreme Calvinism and Tory politics he was taught by his schoolmaster until the 1780s. He had a number of brief and unsuccessful appointments as a minister, and he moved to London in the early 1780s to try his hand as a writer. He wrote a biography of William Pitt the Elder, first Earl of Chatham; various political pamphlets; and three rather weak novels before being taken on as a writer with the Whig news review the *New Annual Register. Political Justice* was written in part as a response to the Revolution Controversy sparked by Edmund Burke's *Reflections on the Revolution in France* (1790), but it expanded in its execution, becoming a founding work of philosophical anarchism and canvassing the possibility of human immortality. It was an immediate success, especially in literary and radical circles. In May 1794 Godwin's first major and most successful novel, *Things as They Are, or The Adventures of Caleb Williams*, was published, adding further to his literary reputation. Two further editions of *Political Justice* in 1796 and 1798 saw the removal of many of the more rationalist elements, suggesting the declining influence of Dissent on Godwin, although some have ascribed the changes also to his relationship with Wollstonecraft, whom he married in March 1797, six months before she died giving birth to their daughter, Mary.

At the end of the 1790s, in the wake of the French Revolution came a backlash against radicalism. Godwin found himself reviled in pamphlets and anti-Jacobin novels and reviews. He lived an increasingly penurious life, supporting Wollstonecraft's first child, Fanny; their daughter, Mary; and providing for his second wife, Mary Jane Clairmont, her two children by a previous relationship, and their own son, William Godwin Jr. He ran a children's publishing house under his wife's name, and continued to write a range of novels, memoirs, histories, and essays, using a pseudonym for his children's books. Percy Bysshe SHELLEY, fired by *Political Justice*, sought him out and offered to raise money on the contents of a sequestered inheritance to help. The relationship turned sour when Shelley wanted half the money raised to divorce his wife, Harriet, so he could marry Godwin's seventeen-year-old daughter, Mary. Shelley and Mary then eloped to France, taking Mary's stepsister, Jane, with them. A succession of tragic family events followed, ending with the deaths of Fanny, Shelley's first wife, and Shelley himself.

For the last thirty years of his life Godwin was plagued by debt and his health deteriorated (he suffered increasingly from fits). He continued to publish widely, but was increasingly concerned to avoid the scandal that his *Memoirs . . .* had generated and which his links to the Shelley circle had revived. Accordingly, while he was determined to set down his position on the imposture of Christianity, he was unwilling to publish it in his own lifetime, and he left it with Mary Shelley with an injunction to publish it, which she effectively ignored—for similar reasons. When Godwin's trenchant attack on organized religion, the Bible, and belief in an afterlife was published in 1873, its time had passed and it aroused little hostility.

MARK PHILP

GOETHE, JOHANN WOLFGANG VON (1749–1832), German author. Much of Goethe's theorizing in biology reflected his view of the unity of nature. He did not explain underlying similarities between animals by alleging that they had common ancestors, for he held that evolution had played a quite insignificant role in the history of species. Rather he supposed that nature used a single archetype in constructing them, and that the task of the biologist is to form a clear idea of this archetype from comparison of a large number of animal forms. He was convinced that nature proceeds in this way, from ideas, just as a human artist creates works from ideas in his mind. For Goethe, "nature" making her plans was no other than God making his plans; and his reading of Baruch SPINOZA confirmed him in this pantheistic view.

In his autobiography Goethe maintained that natural religion of this kind has nothing to fear from rational inquiry, whereas revealed religion, depending as it does on traditions handed down over time, is vulnerable and so requires unquestioning acceptance, which he could

not give. His skepticism toward central Christian beliefs was explicit, and more so in his letters and conversations than in his publications. Thus he wrote to the Swiss pastor J. C. Lavater on August 9, 1782, that a voice from heaven would not make him believe in a virgin birth or a resurrection. Nevertheless, his respect for the Bible was such that he claimed to have derived his own moral orientation almost exclusively from it, and deplored scoffing criticism of it. His standpoint was that valid criticisms do not involve the abandonment of its essentials; but just what these are is not altogether clear from his account of them.

The Efficacy of Faith. In his essay on Israel in the desert ("Israel in der Wüste," included in his notes to the poems of his "West-ostlicher Divan") Goethe declared: "The conflict of faith and unbelief remains the proper, the only, the deepest theme of the history of the world and of mankind. All epochs in which faith is dominant, no matter in what form, are magnificent, heart-warming and fruitful for contemporaries and for posterity; whereas all epochs in which unbelief in whatever form sustains its wretched triumph . . . vanish from the standpoint of posterity."

This would make the Renaissance and the eighteenth century of much less significance than the Dark Ages and the period of the Crusades. Goethe's appreciation of the value of received tradition for social stability (understandable in one who had lived through the upheavals of the French Revolution) seems to have led him here into unduly wide generalizations. The same high evaluation of social stability surely underlay his insistence that the Bible is not to be rejected, but can be reduced to acceptable essentials.

Goethe's views were sufficiently unorthodox to earn him, throughout Germany, the title "the great heathen." He deplored the doctrine that man, insofar as he lacks divine grace, is the helpless victim of sin and depravity; and he refused to supplement his Pelagian optimism concerning human nature with what he regarded as orthodox irrationalisms. "I believed in God and in nature and in the triumph of what is noble over what is base," he said to his secretary, Eckermann, on January 4, 1824. "But that was not enough for pious souls, who wanted me also to believe that three are one and one three. That went against my feeling for truth, and in any case I did not see how it would in the least have profited me." For clergy who promulgated such doctrine he had little respect. In the very last of these conversations recorded by Eckermann (dated March 11, 1832, shortly before Goethe's death), where he allows that the "eminence and moral culture of Christianity" as reflected in the gospels will never be surpassed, he complained that "the richly endowed clergy fear nothing more than the enlightenment of the lower masses" and "kept the Bible from them as long as that was possible."

GEORGE A. WELLS

GOLDMAN, EMMA (1869–1940), American anarchist activist. Emma Goldman was a poor teenaged immigrant working in a sweatshop in Rochester, New York, when she learned about the Haymarket tragedy. She had escaped the tyranny of a cold and orthodox father in Russia, and with her sister landed in Rochester. Finding herself trapped in a loveless marriage, Goldman left her husband and in 1889 moved to New York City, where she immersed herself in the cause of the Haymarket martyrs. She befriended and became lovers with the anarchists Alexander Berkman and Johann Most, who opened her mind to the ideas and possibilities of anarchism (see ANARCHISM AND UNBELIEF).

In New York Goldman earned her living in sweatshops, but her leisure time was spent reading anarchist literature and discussing and debating social and political issues with the people who congregated at Sach's café on Suffolk Street, "headquarters of the East Side radicals." She began speaking publicly, addressing meetings on such topics as the eight-hour workday, and soon found her niche as a stirring and persuasive orator as well as a tireless labor organizer. She plunged herself into these activities after Berkman's arrest and imprisonment for the attempted murder of Henry Clay Frick, the ruthless union-busting chairman of Carnegie Steel, which Goldman had helped plan. She was arrested for inciting to riot during one of her speeches, when she told the workers to "demand bread" and, if they were denied bread, to take it. For this crime, she served a year at Blackwell's Island Penitentiary, where, when asked by the matron about her religion, she proudly declared herself an atheist and refused to attend church.

While incarcerated at Blackwell's Island, Goldman worked in the prison hospital tending to the sick, and upon her release, attended nursing school in Vienna.

She returned to New York in 1896 and resumed her activities.

As a result of Goldman's public declarations and actions, she was arrested and jailed many times. When the anarchist Leon Czolgosz assassinated William McKinley in 1901, Goldman, who had never met Czolgosz but had publicly defended him, was arrested. Several times when she promoted birth control, free-love, and women's emancipation, she spent time in jail (see BIRTH CONTROL AND UNBELIEF; SEX RADICALISM AND UNBELIEF; WOMAN SUFFRAGE MOVEMENT AND UNBELIEF). Once, in Detroit, she was invited to speak at the Congregational church by a liberal-minded pastor, and told the parishioners. "I do not believe in God, because I believe in man. Whatever his mistakes, man has for thousands of years past been working to undo the botched job your God has made."

In 1906 Goldman began publishing a monthly magazine, *Mother Earth*, one of the most important anarchist magazines in US history. With the help of her comrades such as Berkman, Hippolyte Havel, and Max Baginski, *Mother Earth* lasted eleven years, and included editorials, poetry, news of labor struggles and radical movements throughout the world, and philosophical essays in support of anarchism and against religion. It ceased publication when Goldman and Berkman were arrested and deported.

The only war Goldman ever supported was the class war, so when the Wartime Espionage Act was passed in 1917, she and Berkman, along with hundreds of other radicals, were arrested for violating the act by speaking out against the war and by writing articles in *Mother Earth* that encouraged young men to refuse military service. She spent two years in prison, and afterward was stripped of her US citizenship and, with Berkman, deported to Russia.

Although both Berkman and Goldman were at first excited about the idea of joining the revolution in Russia, they soon awakened to the realities of the Bolshevik regime. Brokenhearted, they left Russia as quickly as possible. Afterward both wrote books and articles attacking Vladimir Ilyich Lenin and the Bolsheviks for destroying the Russian Revolution.

Goldman moved to England and married James Colton in order to obtain a British passport. She then set about writing her autobiography, which has been reprinted many times and translated into many languages. It remains one of the most popular autobiographies of all time. After completing it, Goldman toured Germany, which enabled her to foresee the danger of fascism. She promptly targeted the fascists and the Nazis, addressing large groups about the dangers facing Europe if the Nazis were not stopped.

After a final tour of the United States in 1934, Goldman spent time with Berkman in France, and then in Canada. He committed suicide in 1936. Goldman, devastated, immersed herself in the cause of the Spanish anarchists, spending two years supporting their fight against Franco's fascism. In 1938 she returned to Canada, and died in Toronto in 1940. US authorities allowed her to be buried in Chicago's Waldheim Cemetery next to the Haymarket Monument.

Goldman's ATHEISM was rooted in her belief that anarchism is the method to free all people from their economic and spiritual misery, and that a humane and beautiful world will be realized once theism is exposed as the oppressive sham that it is. "Mankind has been punished long and heavily for having created its gods; nothing but pain and persecution have been man's lot since gods began," she wrote. "There is but one way out of this blunder: Man must break his fetters which have chained him to the gates of heaven and hell, so that he can begin to fashion out of his reawakened and illumined consciousness a new world upon earth."

JULIE HERRADA

GORA (1902–1975), Indian atheist activist and social reformer. Founder of the Atheist Centre in Vijayawada, India, the first institution of its type in the world, Gora championed ATHEISM as a positive way of life. Imprisoned in 1942 during India's struggle for freedom, he went on following Indian independence to lead numerous nonviolent campaigns for social change. In 1972 he organized the First World Atheist Conference at Vijayawada. In 2002, on the centenary of his birth, the government of India honored Gora with a commemorative postage stamp.

Consistent in Thought and Action. Born into an orthodox family, Gora lectured at the college level for fifteen years, once heading a department of botany. The rebel in him came to fore in 1926 when the American College in Madurai offered to send him to Yale for research, provided he become a Christian. He refused. After extensive study, he announced himself an atheist.

At Madurai he stayed in a "haunted house," challenging popular belief in ghosts. In 1928 he encouraged his wife, Saraswathi, to view a solar eclipse, taboo for pregnant women. Dispelling superstitions, he walked on fire; challenged local god-men, or *babas*; popularized science exhibitions; and promoted secular education and the scientific outlook.

Throughout his early life he suffered adversity because of his atheism. Because he refused to follow traditional religious practices, his parents demanded that he

leave home. After writing an article titled "The Concept of God," he was dismissed from the faculty of Kakinada College in 1933. The Hindu College at Machilipatnam dismissed him again in 1938, citing his atheism.

With the concurrence of wife and family, Gora founded the Atheist Centre in the village of Mudunur in 1940, shifting it to Vijayawada in 1947. Renouncing private property, Gora operated the Centre on his own sacrifice and commitment and the goodwill of the public.

Campaigns for Equality and Dignity. Gora and the Atheist Centre campaigned for social equality and human dignity. In practice, this meant campaigning against the caste system and untouchability. Braving stiff orthodox opposition, Gora organized intercaste dining, opened public wells to so-called untouchables, and made a point of lodging among untouchables as he traveled in the course of his public engagements. All over the Indian state of Andhra Pradesh he performed casteless and secular marriages. He fought for equality of the sexes and women's liberation. He also initiated steps for social integration of the so-called criminal tribes and opposed their segregation. To break religious barriers, he organized friendship meals at which beef (forbidden to Hindus) and pork (forbidden to Muslims) were served.

Gora's zeal for reform extended to his family life. He gave each of his nine children a nontraditional, secular name. He raised his children on the progressive, atheistic, and democratic model that he advocated for others. He encouraged his children to marry across caste lines, and even to marry untouchables. He attended only weddings to which the local untouchables were also invited, including even the weddings of his close relatives.

Gora's zeal and tenacity of purpose attracted Mahatma Gandhi, who invited Gora and his coworkers to his Sevagram Ashram. *An Atheist with Gandhi* (1951) recounts their discussions.

On the political front, Gora opposed the rise of political parties, which he regarded as an obstacle to social progress. He campaigned for decentralized government and party-less democracy. From 1961 and 1962, he organized an eleven-hundred-mile, hundred-day foot march from Gandhi's Sevagram to New Delhi with the theme "Government Ministers are Servants, People are Masters."

Gora's Positive Atheism. Gora asserted that atheism was a positive stance, opposed to all forms of mental slavery. He said that the essence of atheism lies in the moral freedom of the individual coupled with social responsibility, thus releasing immense human potentialities for development. Atheism as Gora viewed it was not merely a theological position, it was as a way of life: "The spread of the atheist outlook is the hope of humanity to turn from war to peace, from slavery to freedom, from superstition to a sense of reality, from conflict to cooperation."

Gora wielded an indefatigable pen, created an extensive atheist literature, and edited the journals *Sangham* (Society) and *Atheist* for three decades. His advocacy of secular art and culture, his calls for atheists and humanists to cleanse theistic terminology from their language, and his continual pressure to move India toward a postreligious society guaranteed that he was never far from controversy. In 1970 and 1974 Gora toured the world, including the Soviet Union, to strengthen the worldwide atheist and humanist movement.

When Gora died in 1975, a so-called untouchable lit his funeral pyre in the presence of hundreds of admirers. Then–prime minister Indira Gandhi said, "Gora was a man who felt deeply about the evils in society and was dedicated to reform. The movement for the abolition of untouchability, in particular, owes much to him."

The Atheist Centre continues in the forefront of atheism and social reform in India. Mrs. Saraswathi Gora, its cofounder, has won national and international recognition as an outstanding social reformer. Under her guidance, the organization continues a broad agenda of secular social work and has hosted three additional world atheist conferences in 1980, 1996, and 2005.

G. VIJAYAM

GOTT, JOHN WILLIAM (1866–1923), secularist activist. John William Gott is best known for having been imprisoned several times for blasphemy between 1911 and 1922. A secularist and socialist from Bradford, West Yorkshire, England, in 1894 he commenced publication of a monthly titled the *Truthseeker* (not to be confused with the US freethought paper *THE TRUTH SEEKER*) devoted to "mental health and social freedom."

This was taken over by Chapman COHEN, who had met Gott during a speaking tour of the north of England during which Cohen revived branches of the NATIONAL SECULAR SOCIETY (NSS). Cohen attributed the success of his tour to Gott's organizational efforts. However, Cohen dropped the paper, because he objected to the combina-

tion of propaganda with advertisements for Gott's clothing business. Thereafter until its extinction in 1913, the paper was edited by Gott.

Gott was "a thorough Yorkshireman—strongly (though stockily) built, with a fresh complexion, golden hair and bright blue eyes," as biographer T. A. Jackson described him. Gott neither drank nor smoked. He ran a clothing business and was in the habit of including with the suits he sold samples of the "more vulgar and scurrilous types of anti-clerical propaganda."

In 1903 Gott helped found the British Secular League (BSL), of which he became treasurer. The secretary was Percy Ward, and the president was George Jacob HOLYOAKE. Within two years, they would be joined by William Stewart Ross, editor of the *Agnostic Journal*, who became the BSL's vice president. Gott represented the BSL at an international freethought congress in Rome in 1904.

Gott's modest success as a businessman enabled him to employ the victimized Birkenhead socialist Bert Killip as organizer of the BSL. Gott remained active as a member of the National Secular Society, and was a delegate from Bradford to its 1905 conference in Liverpool. Later, as the result of a free speech fight in Leeds, that town's Roman Catholic chief constable contemplated prosecuting Gott for blasphemy. However, the proceedings were quietly dropped. In 1908 Gott was expelled from the Social Democratic Federation (SDF) for refusing to stop selling his pamphlet *Socialism: Christ the Enemy of Mankind* at its conference. (SDF leadership viewed religion as a private matter that should be ignored, while Gott and others took the position that religion and socialism were antithetical and religion should be fought.)

In Dewsbury, *Socialism: Christ the Enemy of Mankind* was burned by Ben Turner, who had been secretary of the Huddersfield Secular Sunday School and belonged to the Independent Labour Party, whose leader Philip Snowden, influenced by nonconformist Christianity, had come under attack in Gott's pamphlet.

Undaunted, Gott set up the Freethought Socialist League, of which he was president. He was aided by T. A. Jackson, a victimized London compositor turned freelance Marxist lecturer who would conduct two meetings in the evenings and three on Sundays from the plinth of the statue of Queen Victoria in Leeds. Jackson was amazed at Gott's prowess as a seller of his own publications.

In 1911 Gott was imprisoned for four months for selling his pamphlet *Rib Ticklers, or Questions for Parsons*. Gott was again imprisoned for two weeks in 1916 in Birkenhead and for six weeks in 1917 in Birmingham. Having served another three months in Birmingham in 1921, he was rearrested in Stratford Broadway, East London. Although George William FOOTE had attacked Gott in articles in the *Freethinker*, this time the NSS rallied to his defense, taking his case to the Court of Criminal Appeal. However, the judge described Gott as an atheist and socialist of the worst sort and sentenced him to nine months hard labor, which he served in full. Suffering from acute diabetes, Gott died shortly after his release.

TERRY LIDDLE

GOULD, STEPHEN JAY (1941–2002), American zoologist and evolutionist. Stephen Jay Gould was unquestionably one of the most public, influential, and controversial biologists of the late twentieth century. A paleontologist by training, he was coauthor with Niles Eldredge of the controversial yet scientifically fruitful theory of punctuated equilibria, which proposed a new interpretation of the known fossil record. He wrote prolifically for the general public; his long-running column in *Natural History* magazine was anthologized in a series of books. The Harvard-based Gould aggressively attacked sociobiology and what he saw as the dangers of biological determinism, engaging in a lifelong intellectual struggle against British evolutionary biologist and popular author Richard Dawkins. Moreover, while fighting CREATIONISM in the public arena, he also wrote an essay (and then a book) maintaining that science and religion can peacefully coexist (see EVOLUTION AND UNBELIEF; RELIGION IN CONFLICT WITH SCIENCE). Gould was a brilliant speaker and writer, yet he was prone to childish behavior toward his audiences, such as shouting after people who left his lectures while he was speaking. His writing style could be extremely rococo, with page-long parenthetical statements and multipage footnotes.

Such a complex figure cannot satisfactorily be analyzed in a brief entry, but it is probably fair to take somewhat of a middle-ground view of Gould as indubitably brilliant, yet flawed; one not to be easily dismissed, yet one whose contribution to science will in the end be less important than he would have hoped.

The 1972 theory of punctuated equilibria maintains that species change on relatively rapid time scales and then undergo periods of stasis over millions of years of nonevolution. Arguably Gould's (and Niles Eldredge's) major scientific accomplishment, the theory had a large impact on paleontology and evolutionary biology. For all the attempts to dismiss it out of hand, it generated a controversy that lasted more than two decades and a string of technical papers reflecting copious research by leading paleontologists and evolutionary biologists. This

is more influence than the overwhelming majority of scientists ever achieve during their careers. On the other hand, the theory was foreshadowed by the work of paleontologist George Gaylord Simpson in the 1940s, which Gould admitted only reluctantly. Moreover, Gould's initial claims as to the revolutionary status of his proposal and the imminent demise of the modern synthesis (see DARWINISM AND UNBELIEF) paradigm that it portended were bold overstatements. They not only sparked partially justified acrimony from the evolutionary community, but arguably gave unnecessary ammunition to the creationist cause by fostering an inaccurate perception that scientists were divided as to the fundamental soundness of evolutionary theory. A 1999 article in the *New Yorker* dubbed Gould "the accidental creationist."

Another of Gould's influential battles was that against sociobiology and biological determinism, which resulted in the publication of a highly influential paper coauthored with Harvard colleague Richard Lewontin in 1979, as well as his book *The Mismeasure of Man* (1981). Again, we see the same pattern of controversy, good but idiosyncratic scholarship, and plain exaggeration. Gould and Lewontin were right in criticizing the then common "adaptationist" assumption in evolutionary biology, which amounts to the proposition that almost anything in living organisms is the result of natural selection. On the other hand, it is also true that—contrary to some of Gould's later statements—natural selection is still the primary explanatory principle in evolution, for the simple reason that it is the only causal factor that we know of that can generate adaptations. In turn, explaining how adaptations come about is really what is most interesting about the Darwinian view of the world, despite Gould's repeated calls to focus on nonadaptive features of living organisms. Similarly, while *The Mismeasure of Man* is a highly readable book that offers much-needed counterpoint to the checkered history of racism in biology, it is ludicrous to dismiss—as Gould did on several occasions—the importance of biological (that is, genetic) factors in explaining some of the variation, not only in physical, but more importantly in cognitive, traits among human beings. Humans result from complex genotype-environment interactions that are reducible neither to simplistic forms of genetic or environmental determinism.

The same mixed pattern holds for Gould's less technical contributions to the intellectual debates of the late twentieth century. On the one hand, he was always adamant that creationism in all its forms is pure nonsense, publicly confronting it on numerous occasions, including a much-publicized 1981 Arkansas trial sometimes dubbed "Scopes II." Yet in his *Rocks of Ages* (1999), he took the fashionable and rather politically correct position that science and religion cannot contradict each other, as they are—to use his somewhat baroque language—two separate and nonoverlapping "magisteria." In this Gould explicitly agreed with Pope John Paul II's equally neat distinction between faith and reason. Of course this concept originated with neither Gould nor John Paul II; it can be traced at least to the mid-nineteenth century, for example, to the writings of John Henry Newman in 1873. More importantly, the soundness of Gould's contention is directly proportional to the vagueness of the concept of "God" that one is willing to espouse. If one's vision of "God" is sufficiently blurry, then it is essentially impossible to find any conflict with empirical evidence, and hence with science. But this is not characteristic of the ongoing debate over science and religion: people who believe that such a conflict exists usually embrace specific concepts of God, which usually include falsifiable (and false!) claims about the physical universe, such as the occurrence of a worldwide flood four thousand years ago. Gould's effort to separate the "magisteria" fails to convince.

Gould concluded his long writing career with additional anthologies of his essays, and most importantly with *The Structure of Evolutionary Theory* (2002), a technical treatise consciously intended as his scientific testament. Once again, and to the end, Gould's contradictions loom large. The book presents an important synthesis of a particular way to look at evolution. Professional biologists must reckon with Gould's vision for a long time to come, either as a reference for further research along the directions outlined by Gould, or as the starting point for criticism and rejection of Gould's view of science and the philosophy of science. However, at Gould's insistence the book was published almost without editorial input, and it shows: it is ponderously long, convoluted, and dotted with irrelevancies. Few would wish something so idiosyncratic and, to many readers, irritating as their permanent legacy. But Gould wanted it that way, and his wishes will inspire and frustrate generations of students and scientists to come.

MASSIMO PIGLIUCCI

GUIGNEBERT, CHARLES (1867–1939), French biblical scholar and critic. One of a "trinity" of French critics (see BIBLICAL CRITICISM) along with Alfred LOISY and Maurice Goguel, Charles Guignebert lectured at the Sorbonne and served as professor of the history of Christianity at the University of Paris. He wrote in the wake of David Friedrich STRAUSS, Rudolf Karl Bultmann, and Albert Schweitzer, assimilating their chief insights, adding many striking observations, and synthesizing the whole into a masterful portrait of Christian origins. Guignebert's arguments are both lucid and judicious, always on guard against premature judgment prompted by either dogmatic allegiance or intolerance for ambiguity.

Guignebert was born on June 18, 1867, at Villeneuve Saint Georges, near Paris. His parents were humble artisans. His father died while Charles was still an infant. His stepfather, a schoolteacher, saw to it that Charles received a good education. First attracted to music, he

seriously considered a career as a tenor. But late-blooming research skills set his life in a different direction. His interest in church history first focused on the early 1400s but steadily crept backward to the study of Christian origins.

Though he could not accept either the Christ myth theory, which held that no historical Jesus existed, or the Dutch Radical denial that Paul authored any of the epistles, Guignebert took both quite seriously. Some of his suggestions are quite radical in their own right. He rejected the *Testimonium Flavianum* (Josephus's supposed paragraph about Jesus) as well as the Slavonic Josephus championed by Robert Eisler. Guignebert considered the gospels difficult to date, and thought they had reached us only in reedited form. He believed that they contain but rare scraps of historical truth, and those almost by accident since their authors were not historians but evangelists and propagandists. For Guignebert, the facts of Jesus's life were immediately lost behind the stained glass wall of Christological dogma.

Among Guignebert's contentions: Jesus's birthplace is unknown, Bethlehem being a function of fictive prophetic fulfillment, and "the Nazarene" being no reference to Nazareth but rather, most likely, an epithet equivalent to "the Holy One." "Jesus" itself was probably not the birth name (now lost) of the Galilean prophet, but rather a cultic title meaning "savior." The Virgin Birth doctrine is not even original to the texts of Matthew and Luke, but a later syncretistic import. "Son of God" denoted only "servant of God" in Palestine. It became a metaphysical designation only on Greek soil. Jesus may have been baptized by John, but the gospel account is probably a piece of liturgical fiction, setting the example for the baptized. Jesus's public ministry lasted but a few months or even weeks. The impression of Jesus thronged by crowds is artificial, secondary to the rival notion that he was mostly rejected by contemporaries. He probably had only a dozen or so followers, though "the Twelve" were consolidated as a group only after Jesus's death. The stories of the triumphal entry and cleansing of the temple are both pious fictions; had they occurred, Jesus would have perished then and there. The Passion reflects the bare fact of Jesus's crucifixion (which may not have occurred under Pilate or during Passover), and it has been filled out by scriptural details, drawing especially from Psalm 22. The Romans eliminated Jesus, but the gospels shift the blame gratuitously to the Jewish authorities: Mark to the Sanhedrin, Luke to Herod Antipas. The disciples returned to Galilee, the fishermen continuing together, and Peter's mounting sense that Jesus was alive with God issued in a vision of the living Jesus. They eventually returned to Jerusalem to quietly build a community of the like-minded. Jesus had (erroneously) heralded the imminent end of the age, and the disciples made him into the Messiah who would soon return to inaugurate the kingdom. Like Jesus, they were Torah-observant Jews. Hellenistic Jews with a more cosmopolitan outlook soon distanced themselves from Jewish law and particularism, fleeing Jerusalem and initiating the first real evangelism. Paul first opposed the Hellenists but then joined them. He, no doubt like his predecessors, interpreted Jesus as a resurrected savior in the categories of the mystery religions with their sacraments of union with a resurrected god.

Just before World War I Guignebert was active in the movement to separate church and state in France and to free public education from the grip of Catholic dogma. He died on August 27, 1939.

ROBERT M. PRICE

HACKER, JEREMIAH (1801–1895), American Spiritualist, anarchist, and pacifist. Born at Brunswick, Maine, on May 16, 1801, to American Quaker parents, Jeremiah Hacker received a common school education and worked as a schoolteacher. From 1837 he wandered Maine denouncing "government-craft" and "religious forms of any kind," treating injuries, and stressing the divine inspiration of Jesus within the individual. Widowed in 1839 with nine children, he married Submit Tobey in 1845 and moved with her to Portland, Maine, where he published his weekly *Pleasure Boat* under various titles until 1864. Nearly deaf and known for personal warmth, the "Owner, Master, and Crew" declared he had "launched our little boat upon the waters of love . . . ready to receive passengers on an excursion of pleasure." Militantly abolitionist, giving direct support for fugitive slaves, he opposed war as a solution. While dismissing the ballot as a method for an unjust majority to rule, he fought for women's equality, prison reform, and against land monopoly by developers (see ANARCHISM AND UNBELIEF). Before 1859 he toned down his Christianity and preached as a Spiritualist (see SPIRITUALISM AND UNBELIEF). In 1867 the Hackers moved to Berlin, New Jersey, from where he lectured and briefly resumed publishing his paper. His essays and poems sometimes appeared in *Lucifer* and the *Firebrand* until his death in Vineland, New Jersey, on August 30, 1895.

ROBERT P. HELMS

HAECKEL, ERNST HEINRICH (1834–1919), German evolutionary philosopher. Ernst Haeckel was born in Potsdam, Prussia, on February 15, 1834, and died in Jena on August 9, 1919. As a scientist, he is best remembered for his work on radiolarians, his avocation of recapitulation, the idea that "ontogenesis is a brief and rapid recapitulation of phylogenesis, determined by the physiological functions of heredity (generation) and adaptation (maintenance)," and for his neologisms (for example, "phylum," "phylogeny," and "ecology" were all his coinages). It is as a vocal supporter of cosmic evolutionism, however, that he has received his greatest infamy (see EVOLUTION AND UNBELIEF).

Haeckel's reading of Charles DARWIN's *Origin of Species* in the spring of 1860 conclusively changed his life. Abandoning medicine, he became professor of zoology and comparative anatomy at the University of Jena, where he remained until his death. He saw Darwinian natural selection and common descent as a principle that would unify philosophy, politics, and science into a single monistic worldview. As he noted nearly forty years later in *Riddle of the Universe*, his most popular work, this monism "recognizes one sole substance in the universe, which is at once 'God and nature'; body and spirit (or matter and energy) it holds to be inseparable. The extra-mundane God of dualism leads necessarily to theism; and the intra-mundane God of the monist leads to pantheism." Such cosmic pantheism—which he admitted to be a polite form of ATHEISM—led him to deny the immortality of the soul, human free will (see DETERMINISM), and the existence of a personal God (see EXISTENCE OF GOD, ARGUMENTS FOR AND AGAINST). However, this pantheism too had obvious religious overtones, reflecting a certain longing of the Romanticism of the earlier part of the nineteenth century (for this, see the documentary *Proteus*). In his *The Riddle of the Universe*, Haeckel declared that "truth unadulterated is only to be found in the temple of the study of nature" and "the only available paths to it are critical observation and reflection—the empirical investigation of facts and the rational study of their efficient causes. . . . The goddess of truth dwells in the temple of nature, in the green woods, on the blue sea, and on the snowy summits of the hills—not in the gloom of the cloister . . . nor in the clouds of incense of our Christian churches." Anthropocentrism was to be eschewed: humans were as much a part of nature as any other organism, and human body and mind both arose through the inexorable action of natural forces. The continuity of nature was expressed in Haeckel's willingness to draw speculative phylogenies, something Darwin would never have done publicly. Most famously, it led him to predict the existence of a "missing link" between man and ape, which would, he claimed, be found in Southeast Asia. Astonishingly, such a specimen (which he named *Pithecanthropus alalus*, "ape without speech") was subsequently found in Java by Heackel's young disciple Eugene Dubois in 1891.

Haeckel's antipathy toward the Church was obvious. In his *Natural History of Creation*, he saw Christian morality as a distortion of nature. He noted: "If we contemplate the mutual relations between plants and animals (man included), we shall find everywhere and at all times, the very opposite of that kindly and peaceful social life which the goodness of the Creator ought to have prepared for his creatures—we shall rather find everywhere a pitiless, most embittered struggle of all against all." Unlike Darwin's other great popularizer, Thomas Henry HUXLEY, who argued against drawing moral lessons from the natural world, Haeckel felt that such natural struggle offered hope for the intellectual development of humankind. He continued: "The result of the struggle for life is that, in the long run, that which is better, more perfect, conquers that which is weaker and more imperfect. In human life, however, this struggle for life will ever become more and more an intellectual struggle, not a struggle with weapons of murder. . . . The man with the most perfect understanding, not the man with the best revolver, will in the long run be victorious; he will transmit to his descendants the qualities of the brain which assisted him in the victory." Paradoxically, while Haeckel saw struggle and selection all around, he felt that Darwin's mechanism, natural selection, was insufficiently strong to *generate* observed biological diversity. Instead, he believed, the environment acted directly on organisms resulting in new races, thus positing a form of Lamarckianism. Once formed, on Haeckel's view, the *survival* of these races depended on their interaction with the environment through a form of natural selection.

Haeckel's popular writings led to the development of a cult of personality that formalized itself around the Monist League, which he founded in 1906 with the goal of replacing Christianity with a "true religion" of science and reason. The league promoted a concept of society in which natural selection was seen as a natural social principle, and its members held that certain races were more fit than others and would necessarily triumph (see EUGENICS). Some (such as Gasman) have thus argued for Haeckel's influence on the development of National Socialism. This has been contested by others (such as Weikart) who are often more willing to posit (equally erroneously) a more direct lineage run-

ning from Darwin to the Nazis. While the origin of Nazi race theory has many factors, certainly Haeckel's rhetoric in many places foreshadows that of the Nazis: In *Freedom in Science and Teaching*, he noted that the "selection, the picking out of these 'chosen ones,' is inevitably connected with the arrest and destruction of the remaining majority." His philosophical support for eugenics and anti-Semitism, when coupled with his undoubted popularity, were perhaps crucial in providing a scientific legitimization for such ideas. It is perhaps notable that, while the Monist League was disbanded when Adolf Hitler became chancellor in 1933, its influence still lives on in the "cosmotheism" advocated by some white supremacists, in particular followers of William Pierce.

JOHN M. LYNCH

HALDEMAN-JULIUS, EMANUEL (1889–1951), American freethought publisher. David and Elizabeth Zolajefsky emigrated from Odessa to the United States in 1887, two years before the birth of their fifth child, Emanuel. They had lost one child to illness en route. David Zolajefsky, trained as a bookbinder, was able to find satisfactory work in the new country, though it was his first employer who, out of convenience, changed the name Zolajefsky to Julius. Although both their fathers were rabbis in Russia, neither David nor Elizabeth was particularly religious, but neither were they freethinkers. According to Emanuel, "they were indifferent, for which I thank them." Emanuel Julius was born on July 30, 1889, in Philadelphia.

At thirteen Julius left school to help his family as a wage earner, taking a series of odd jobs. It was during this time that Emanuel's education really started. Although he first began reading dime novels, he soon encountered the writings of Thomas PAINE and Robert Green INGERSOLL. The question of God was soon resolved for good as far as this young boy was concerned, and he became a freethinker. He continued to read voraciously, science and history as well as literature. In his teens Julius discovered the local Socialist Party headquarters in Philadelphia, which he referred to as a "citadel of social consciousness" and began listening to discussions of the older members.

Following his conversion to socialism, Julius moved to New York at age seventeen. In Tarrytown, New York, he worked as a bellboy at the Castle School for Girls, and won the friendship of the kindly librarian of the school, Lilian Parsons, who became a strong influence. She recommended readings and introduced him to the writings of Mark Twain (Samuel CLEMENS).

It was while working at the school that Julius began enthusiastically writing, submitting his articles to Socialist newspapers. Upon Twain's death, he wrote his first bylined article, "Mark Twain: Radical," for the *International Socialist Review*, which gained him some recognition. Soon after, he began working as a copy editor for the *New York Evening Call*, a Socialist newspaper in New York City, whose editor at the time was Louis Kopelin. He and Kopelin became the targets of anti-Semitic attacks from liberals and leftists, people whom Julius thought would have transcended such behavior. This caused a reaction in him that resulted in overwork and overachievement. He developed a level of stamina that would continue throughout his life.

In 1911 Julius was offered a job in Milwaukee with Victor Berger's new Socialist newspaper, the *Leader*. He earned a reputation as a hard worker; assigned work from morning to night, Julius enjoyed the work and was happy to have writing practice.

After gaining valuable writing experience at the *Leader*, Julius went to Chicago in 1913 to work on the *Chicago World*, but didn't stay long before moving to Los Angeles to work with a weekly labor newspaper, the *Citizen.* Shortly afterward he became associate editor of *Western Comrade*, a monthly owned by Stanley Wilson. The paper was not a commercial success, however, and Wilson soon turned its ownership over to Julius. Five months later, although true to his promise of making it a success, he gave up ownership to return to New York to take a position as editor of the Sunday magazine edition of the *Call.*

After a year, Julius was offered a position of staff correspondent of *Appeal to Reason* with his old associate, Louis Kopelin in Girard, Kansas. With a circulation of one million, the *Appeal* was the largest Socialist newspaper in the country. The *Appeal* was suffering as a result of founder J. A. Wayland's suicide in 1912. In addition, its vacillation over the issue of US entry into World War I

had caused a drop in circulation. In 1915 Julius left the *Call* and went to Girard, Kansas, to work with Louis Kopelin on the *Appeal*.

In June of 1916 Julius married Marcet Haldeman, a former actress turned banker, heiress, feminist, and niece of Jane ADDAMS of Hull House fame. They were married in the Presbyterian Church, but here convention ceases. At the suggestion of Marcet's aunt Jane, the couple combined their last names to form a new surname: Haldeman-Julius. In addition, they kept their individual incomes separate and split evenly their common expenses. Under an agreement that was made prior to their marriage, Emanuel had no access to Marcet's money. Emanuel and Marcet had two children, Alice and Henry, and a foster child, Josephine.

World War I brought a split in the Socialist Party that affected the *Appeal*'s livelihood. Circulation suffered and, although the majority of members continued to oppose the war, it was only a two-thirds majority. The *Appeal* vacillated on its position for months, until, facing possible violation of the Espionage Act, the paper finally decided to express public support for the war. The name of the paper was changed to *New Appeal*. Haldeman-Julius continued to write for the new paper, eventually becoming part owner with Kopelin and Marcet.

In 1919 Haldeman-Julius began publishing a pocket series of small booklets that were sold for fifteen to twenty-five cents apiece. Covering everything from classic literature and poetry to socialism, FREETHOUGHT, and self-help, the so-called Little Blue Books became big sellers. Among his favorite authors to print were Paine, Ingersoll, and the former priest Joseph MCCABE. Haldeman-Julius was a master at promoting these booklets, often changing the original, mundane titles of reprinted texts to more titillating ones. This tactic boosted sales dramatically.

By 1922, with the great success of the pocket series, and with his goal to make literature accessible to all Americans, the *Appeal* was renamed the *Haldeman-Julius Weekly*. It maintained some news reporting and included more book reviews, but essentially became an opinion paper and an advertising medium for the pocket series. Soon Haldeman-Julius introduced another publication, *Life and Letters*, a literary magazine devoting each issue to a particular literary figure. His *Haldeman-Julius Monthly*, begun in 1924, was dedicated to "the memory of that Great Liberator—that Mighty Gladiator in the War on Superstition and Intolerance—VOLTAIRE." One of the earliest issues of the *Monthly* contained an article written by Haldeman-Julius entitled "Religion—a Pile of Garbage." This was Haldeman-Julius's freethought paper, launched during the Scopes monkey trial in Tennessee. In the 1920s the matter of religion in American society was a divisive topic. In 1925 Emanuel and Marcet traveled to Dayton, Tennessee, to report on the Scopes trial, meeting Clarence DARROW there.

In 1925 the name of the pocket series was officially changed to Little Blue Books, and more attention was dedicated to the topic of sex, renaming the category "Social Hygiene." Kopelin sold his part of the business to Haldeman-Julius and returned to New York.

The American Freethinkers' League, founded by Haldeman-Julius in 1925, was an association of freethinkers, anticlericals, believers in free speech, protectors of the torch of reason and science, and warriors "against all forms of rampant Fundamentalism," as promoted in the *Haldeman-Julius Monthly*. Within the first month, membership was reported at 1,628.

In 1928 the *Haldeman-Julius Monthly* became the *Debunker*, and another publication, the *Haldeman-Julius Quarterly*, became the *American Parade*. After authoring a few novels, two of them (*Dust* and *Violence*) in collaboration with his wife, Haldeman-Julius wrote and published *The Outline of Bunk, including The Admirations of a Debunker*. Describing "bunk" as "all attempts to understand and explain life on the basis of subconscious mind, primitive personality, religious mysticism, romanticism, idealism, subjectivism, and other basically irrational isms," the book met with mixed reviews.

In April 1929 Haldeman-Julius launched the *American Freeman*, and even the marketing genius himself could not protect it from the severe grip of the Great Depression. Within a year it was operating at a deficit, but Haldeman-Julius persisted. He started a smear campaign against capitalism in general and against President Herbert Hoover and Vice President Charles Curtin in particular. Each issue and even some special issues of the *American Freeman* contained scathing attacks on them. In 1931, because of continuous financial losses, he combined the *Debunker* and *American Parade* with the *American Freeman*. With the paper's continued attacks on Hoover, circulation increased. The US Post Office deemed the *Freeman* unmailable, bringing more publicity to it than its publisher could have hoped for. After Hoover lost to Franklin D. Roosevelt in 1932 (and Haldeman-Julius lost his bid for the Senate), sales of the *Freeman* slid. Haldeman-Julius introduced yet another new publication, the *Militant Atheist*, which did not do well. A year later he suspended publication, transferred the subscriptions to the *Freeman*, and slowed that paper's frequency to a monthly. With unflinching dedication, the publishing company survived the Depression years, and the Little Blue Books and the *American Freeman* survived as well.

Marcet and Emanuel's relationship deteriorated over the years, mainly due to money and Emanuel's womanizing. Although they technically continued living under the same roof, Marcet spent a lot of her time at the family farm in Cedarville. Their financial statuses had reversed, Marcet having transferred most of her stock to the publishing company in the 1920s. Because of their agreement when they married always to keep their financial matters separate, she struggled constantly to make ends meet. Marcet suffered from a weak heart and died

in 1941. There is no indication that Emanuel mourned her death.

Haldeman-Julius continued to advertise the Little Blue Books, offering special sales on the entire collection and discounts on individual titles. At the same time he attacked convention and religion, particularly the Catholic Church and the pope, in the pages of the *Freeman*. Joseph McCabe, one of Haldeman-Julius's most prolific sources for Blue Book titles, obliged him with ever more anti-Catholic works. Controversy over the advertising of these titles brought more and more publicity.

In 1950 Haldeman-Julius was indicted for tax fraud, and in 1951 he was found guilty on two counts of income tax evasion. He was awaiting appeal when he drowned in the swimming pool of his Girard estate.

The years of high energy, feverish writing, hectic publishing schedules, frequent title changes of his publications, and an action-packed lifestyle, countered by "long fits of depression," suggest that Haldeman-Julius might have suffered from bipolar disorder. His persistent and outspoken debunking was much appreciated by the freethinking public, which certainly benefited from the work of the "Henry Ford of literature."

HALL, SHARLOT (1870–1943), American freethought lecturer. Born October 27, 1870, in frontier Kansas to a literate mother and an illiterate father, Sharlot Hall was given her Native American first name by her uncle. Her family moved near Prescott, then to Dewey, Arizona. Bright and talented, Sharlot chafed at the monotony and isolation of ranch life. To escape, she worked for room and board for a half year in order to attend Prescott High School. She also began writing, and received her first payment for a story early in her teens. Her mother's illness forced her return to the rigors of domestic duties and outdoor work. Observing the lot of her mother and most women she knew, Sharlot vowed never to marry. She became interested in photography and explored ancient Native American cliff dwellings with her brother.

Sharlot and her family attended lectures by freethinker Samuel Porter PUTNAM in Prescott in 1895. She joined Putnam on the platform in his final speech, speaking about Thomas PAINE. She was twenty-four to Putnam's fifty-six, but apparently fell in love. Putnam died from a gas leakage in 1896. His fully clothed body was found in a hotel room with that of a clothed young woman lecturer, Mary L. Collins. The hint of impropriety created scandalous national headlines. Although Putnam's death was a great shock to Hall, she commemorated his memory with poetry published in *THE TRUTH SEEKER*.

Hall wrote for many newspapers, and became the protégée of Charles F. Lummis, editor of *Land of Sunshine* in Los Angeles. Through Lummis, she met freethinking luminaries of her day, including Charlotte Perkins GILMAN. Two volumes of her poetry, including occasional irreverent verse, were published. Hall began a project of taking oral histories of Arizona pioneers. In 1909 territorial governor Judge Richard Sloan, her friend, made her territorial historian. She was granted an office in Phoenix and traveled throughout the state collecting history, supported by the Federation of Women's Clubs. After Arizona achieved statehood, the first governor dismissed her in 1912. Soon after, her mother died. Hall retired to a nearly reclusive lifestyle, caring for her father until his death in 1925. In 1927, when she was fifty-seven, the city of Prescott awarded Hall a life lease on the governor's mansion, to restore it as a museum of early Arizona history. She died of heart trouble on April 9, 1943. The mansion and the Sharlot Hall Museum remain open.

ANNIE LAURIE GAYLOR

HANLON, JAMES OGDEN (1899–1986), New Zealand rationalist and journalist. James Ogden Hanlon was born and lived most of his life in Auckland, New Zealand. His father had been Catholic but at some point became a rationalist, and brought up his son that way. Hanlon worked as a cub reporter before he enlisted for service in the First World War. After his demobilization he returned to journalism, working most of his life for Auckland's evening paper, the *Auckland Star*. As a young reporter for the *Star* in 1923, Hanlon covered the lectures given by Joseph MCCABE in Auckland. This was a defining moment in Hanlon's life.

After a ten-year stint in the United Kingdom working on provincial newspapers, Hanlon returned to New Zealand and his job with the *Star* in 1938. He also joined the Rationalist Association, and over the course of his half century of membership served as vice president

three times between 1945 and 1961, and as president from 1955 until 1958 and again, briefly, between August 1958 and May 1959. But his main contribution was in his role as editor of the *New Zealand Rationalist*, which in October 1964 became the *New Zealand Rationalist and Humanist*. Hanlon served as editor from September 1939 to March 1942, late 1943 to May 1953, May 1955 to August 1958, October to December 1959, August 1961 to November 1973, and February 1974 until September 1975. During these twenty-nine years Hanlon wrote 218 editorials and a great many other articles, shorter contributions, and several pamphlets. Hanlon was one of the longest-serving editors of any publication in freethought history, ranking alongside Charles Albert WATTS with the *Literary Guide*, Horace SEAVER with the *BOSTON INVESTIGATOR*, and Chapman COHEN with the *FREETHINKER*.

In some ways Hanlon stayed on too long, becoming something of a liability in his later years. His rationalism was very strongly influenced by McCabe, Cohen, and the RATIONALIST PRESS ASSOCIATION. He became progressively less able to adapt as rationalism gave way to HUMANISM in the 1960s. Very appropriately, however, Hanlon was made a life member of the Rationalist Association in 1955.

Hanlon was also active in the Worker's Educational Association, the Howard League for Penal Reform, and the Voluntary Euthanasia Society of England. He married Alice Horspool in 1928. They had no children.

BILL COOKE

HANSBERRY, LORRAINE (1930–1965), American playwright, painter, and humanist. Lorraine Hansberry's *A Raisin in the Sun*, the first drama by a black woman to be produced on Broadway, won the New York Drama Critics' Circle Award for best play of 1959, chosen over plays by such celebrated figures as Tennessee Williams and Eugene O'Neill. With this success Hansberry became the first black woman intellectual to achieve national celebrity status.

Hansberry was born in Chicago. Her uncle was a leading African American scholar; her parents often hosted black celebrities at their home, including Joe Louis, Jesse Owens, Paul Robeson, Duke Ellington, and civil rights leader Walter White.

In 1950 Hansberry went to work for *Freedom*, a paper published by Robeson. She became actively involved in civil rights struggles. Her influence increased, and she became the associate editor of *Freedom*. The following year, she studied African culture and history under W. E. B. DUBOIS at the Jefferson School for Social Science. In that same year, she married songwriter Robert Nemiroff. The couple divorced in 1964.

A Raisin in the Sun was based on Hansberry's real-life experience. To challenge racist real estate practices, Hansberry's parents bought a house in a predominantly white neighborhood near the University of Chicago in 1938. A mob tried to run them out of the community. The family sued, eventually winning an important 1940 US Supreme Court decision (*Hansberry v. Lee*). The title *A Raisin in the Sun* was borrowed from a Langston HUGHES poem: "What happens to a dream deferred?/Does it dry up/like a raisin in the sun?/. . . /Or does it explode?"

Hansberry was outspoken about her SECULAR HUMANISM. In her works she never recognized God or transcendent morality. She believed human beings could conquer their problems with the use of reason, and that so long as there was suffering and injustice in the world, attempts to make the world a better place would give human beings all the meaning in life they would ever need.

Hansberry was a lesbian, feminist, and socialist, but her primary interest was in fighting against white supremacy and liberating black people. However, many black people—intellectuals included—have erroneously believed that Hansberry was sympathetic to the idea that Christianity could be a liberating force in the lives of black people. Hansberry said in an interview that people revert to religion when they are afraid, but she expressed confidence that rationality would triumph in the end.

On January 12, 1965, Hansberry succumbed to cancer at the age of thirty-four. However, *To Be Young, Gifted, and Black* was culled from her writings and produced off Broadway in 1969. *A Raisin in the Sun* continues to thrill audiences in numerous regional theater productions throughout the United States.

NORM R. ALLEN JR.

HARMAN, LILLIAN (1869–1929), American sex radical and editor. At the age of sixteen, Lillian Harman challenged the marriage laws of Kansas by entering into a

"free (nonchurch, nonstate) marriage" with thirty-seven-year-old Edwin C. Walker. Her subsequent role in the publication of *Lucifer, The Light-Bearer*; *Fair Play*; *Our New Humanity*; and the *American Journal of* EUGENICS brought her international recognition.

Childhood. The daughter of Moses and Susan (Scheuck) Harman, Lillian was born in Crawford County, Missouri, in December 1869. Her mother died when she was seven, and in 1879 her father moved Lillian and her brother, George, to the rural community of Valley Falls, Kansas. Immersing himself in the local chapter of the NATIONAL LIBERAL LEAGUE, he became coeditor of the league's paper, the *Valley Falls Liberal*, which in 1883, as sole editor, he renamed *Lucifer, The Light-Bearer*. As thirteen-year-old Lillian set type for her father's paper, she learned about such causes as women's sexual emancipation and the freedom of the press to address sexual topics.

The Free Marriage. Lillian Harman chose to protest church- and state-sanctioned marriage because of the power it gave a husband to control his wife's property, identity, and body (see SEX RADICALISM AND UNBELIEF). Arrested and convicted for violating the Kansas Marriage Act, she served time in jail for refusing to pay court costs. Publicity surrounding her free marriage transformed Harman into a national icon for women's sexual emancipation and prompted sex radical women and others to debate such feminist issues as age-of-consent legislation and marital rape, and to challenge authorities denying them access to sexual information. It also helped swell *Lucifer*'s subscription list, transforming the struggling regional weekly into the nation's leading voice for sex radicalism.

Sex Radical Activism. Upon her release from jail in 1887, Harman assumed a more active role in the publication of *Lucifer*, and in 1888 she and Walker established their own anarchist publication, *Fair Play*, which was published intermittently until its demise in 1908. In the 1890s and 1900s she aided her father in the publication of the short-lived *Our New Humanity* and *American Journal of Eugenics*, which ceased after Moses HARMAN's death in 1910. Her published works include *Some Problems of Social Freedom* (1898), *Marriage and Mortality* (1900), and *The Regeneration of Society* (1900).

Committed to the cause of free motherhood, in 1893 Harman chose to have a child with Walker (even though they lived separately for much of their married life). Before becoming a "free mother," she required him to sign a document stipulating that he would provide his share of support for the child, whom she named Virna Winifred Walker. Lillian Harman's commitment to sex radical activism earned her international recognition in 1897 when she became president of the Legitimation League, established in England in 1893 to advocate the legitimacy of nonmarital sexual relations and to ensure that partners and their offspring would have the same rights of property and inheritance. Writing numerous articles for *Adult* (the league's journal, published between 1897 and 1899), she campaigned against age-of-consent legislation because of the limits it placed on women's freedom. Harman regarded reformers like Frances Willard of the Woman's Christian Temperance Union as well-intentioned but misguided, because they promoted the image of women as sexually vulnerable.

Later Years. In the early 1900s Harman married a radical Chicago newspaper printer named George R. O'Brien and in 1910 he became president of the Chicago Typographical Union. Their son, George Harman O'Brien, studied law and Harman's daughter became a musician and dancer. Little else is known about Lillian Harman's life after the *American Journal of Eugenics* ceased publication in 1910. She died around 1929.

JOANNE E. PASSET

HARMAN, MOSES (1830–1910), American free-love activist. One of the most fervent and dedicated male feminist activists in US history, Moses Harman was born in Virginia to Job and Nancy Harman, and grew up in the Ozarks of Missouri. His parents farmed, mined, and wove baskets: subsistence living, to be sure. Moses attended only a few months of school, but, partly due to an accident that left him lame, he was an avid reader. He began teaching school at the age of sixteen, and two years later started his formal studies.

An ordained Methodist minister by the age of twenty, at twenty-one he discovered the Universalists (see UNIVERSALISM TO 1961) and preferred their antislavery position. He continued to teach and study, traveling but eventually returning to Missouri. By that time he was an outspoken abolitionist, not a popular stand in Crawford County; his views nearly got him killed. He tried to enlist in the Union army, but was rejected twice because of his physical disability.

Following the Civil War, Harman married Susan Scheuck and had two children, George and Lillian HARMAN. Although it was a conventional marriage ceremony, the two entered into an agreement vowing a relationship based on love rather than obligation (see SEX RADICALISM AND UNBELIEF). Susan died in childbirth, along with their third child. Harman took George and Lillian to live on a farm with his cousin Noah Harman in Valley Falls, Kansas.

After participating in an exchange in the local Valley

Falls paper, the *New Era*, between religionists and freethinkers (see FREETHOUGHT), Harman and some other freethinkers began publishing a paper under the auspices of the Valley Falls Liberal League, an organization devoted to the separation of church and state. In 1880 Harman began editing the *Valley Falls Liberal.* The named was later changed to the *Kansas Liberal.*

Two years later, the *Kansas Liberal* became *Lucifer, The Light Bearer*, a free-love periodical that advocated total equality between men and women and openly discussed the sexual aspects of their relationships. In addition to *Lucifer*, Harman also published a number of pamphlets on similar topics. An individualist anarchist (see ANARCHISM AND UNBELIEF) and proponent for absolute freedom of speech, Harman would not censor any articles or letters, resulting in continuous harassment by the authorities for violations of the Comstock Act (see COMSTOCK, ANTHONY, AND UNBELIEF). The first violation came in June 1886, when he published a letter depicting an incident of sexual abuse in a marriage, referring to it as "rape." Moses, George, and Edwin C. Walker were arrested and indicted on 270 counts of obscenity. Walker, incidentally, was already in jail, along with Lillian, for entering into a non-state-sanctioned marriage. The obscenity charges against George Harman and Walker were soon dropped, but Moses stood trial and was found guilty on four counts of obscenity. Although initially sentenced to five years' imprisonment, he served only four months. He was again tried for obscenity on a separate charge, and this time served eight months. To keep *Lucifer* going during this time, he appointed Lois WAISBROOKER as coeditor. She followed the house tradition by publishing an article over which *Lucifer* was banned from the mails. After his release, Harman was sentenced again on another charge, and served one year of hard labor.

Many supporters of Harman and *Lucifer* considered his actions unwise; he was criticized by some for creating his own problems with the law by printing articles sure to get him arrested, but most were sympathetic and felt he received excessive punishment. Thousands signed petitions criticizing the unjust treatment he received. Upon his release from prison in 1896, Harman moved to Chicago, taking *Lucifer* with him.

In 1905 Harman was again arrested on obscenity charges and at the age of seventy-five was sentenced to one year of hard labor at Joliet Prison. He spent eight months breaking rocks and became so ill that he was transferred to Leavenworth, to complete his sentence in the hospital there.

The constant government harassment against *Lucifer* began to wear thin, while at the same time Harman became increasingly interested in the topic of birth control and a woman's right to choose if, when, and with whom to bear children. In 1907 *Lucifer* became the *American Journal of EUGENICS.* Harman relocated to Los Angeles in 1908, continuing to publish the *Journal.* He died there in 1910, and Lillian published a final memorial issue.

Lucifer, The Light Bearer is still considered one of the most influential and compelling feminist newspapers in US history.

JULIE HERRADA

HARRISON, HUBERT HENRY (1883–1927), American humanist activist. One of the greatest intellectuals and orators of his day, Hubert Henry Harrison was born in Concordia, St. Croix, Danish West Indies, and arrived in New York City in 1900. Over the next seven years, he abandoned Christianity and embraced FREETHOUGHT.

In 1911 he became a leading proponent of socialism as a member of the Socialist Party (see SOCIALISM AND UNBELIEF). Later, he became disenchanted with and criticized the party's racism, and was subsequently suspended. Due in large part to his negative experiences with the socialists, Harrison developed his concepts of "Africa first" or "race first." Though he opposed racism in all its forms, he believed people of African descent had to put their interests as a people above all other interests, including class interests.

In 1917 he introduced activist Marcus Garvey to a large meeting of his own organization, the Liberty League, at a Harlem church. Garvey founded the Universal Negro Improvement Association (UNIA), one of the largest mass movements of black people in US history. In 1920 Harrison became the managing editor of the UNIA newspaper the *Negro World.* Though he later he became critical of Garvey and left the UNIA, he continued to contribute to the *Negro World.*

Harrison was perhaps first of a long line of Harlem street orators, or "street scholars," his oratorical skills enthralling as many as eleven thousand people at a time. In scathing attacks upon religion, he called attention to biblical contradictions and absurd biblical ideas. He urged audiences to read the lectures of Robert Green INGERSOLL, Thomas PAINE's *Age of Reason*, Andrew Dickson WHITE's *Warfare of Science with Theology*, and other classics of freethought. He critiqued the so-called myth of Ham, the claim that a curse placed upon Canaan (son of Ham) by his grandfather Noah doomed the black race to eternal subservience. He acidly noted that while God, Jesus, the Holy Ghost, and the angels were all depicted as whites, the only powerful black character in

the Christian drama was the devil. Harrison said that freethought should be more widespread among African Americans, who were, after all, among the most oppressed victims of Christianity. He emphasized that despite lip service given to Christian love, blacks were not even allowed to pray in white churches.

Consistent in his commitment to universal human rights, Harrison also championed the white working class, fought for Irish home rule, and supported liberation struggles in China and India. He won admiration from Americans from all walks of life, and thousands paid homage at his funeral.

NORM R. ALLEN JR.

HARTMANN, KARL ROBERT EDUARD VON (1842–1906), German philosopher and pessimist. Karl Robert Eduard von Hartmann was originally an artillery officer in the Prussian army; he turned to philosophy after an injury ended his military career. Returning to Berlin, where he would spend the rest of his life, he wrote most of his work while in bed, suffering great pain from his leg wound. Following in the footsteps of Arthur SCHOPENHAUER, he argued that the basis of ethics should be grounded in a realization of the utter futility of life. Combining Schopenhauer's pessimistic metaphysics with the ethical writings of Immanuel KANT and the process philosophy of George Hegel, von Hartmann published a series of books which received wide recognition and made him one of the best-known thinkers of his day.

Von Hartmann's first and most popular work, *Die Philosophie des Unbewussten* (The Philosophy of the Unconscious), was published in 1869, and became an immediate best seller. In it, he advocated what he called "Spiritual Monism," the view that matter is both idea and will. The opposition of these two forces accidentally created the existence of consciousness.

The existence of consciousness creates a problem, though, as conscious beings become increasingly aware of the misery of the world around them. The evolution of human beings, with their highly developed awareness of their world, led to three stages in the attempt to combat pessimism. The first stage claimed that happiness is possible in the here-and-now (and was identified with the rise of the Roman Empire and its claims to have pacified the world). When this was found untenable, the second stage arose, which claimed that happiness would be found in the next world (as found in the doctrines of PLATO, Christianity, and Islam). The third stage, identified with the rise of POSITIVISM and socialism (see SOCIALISM AND UNBELIEF), claimed that true happiness would be found in a future state of earthly utopia.

Yet, von Hartmann argued, increasingly consciousness shows that all three stages are mere wishful thinking. This is indeed the best of all possible worlds, but it would be much better if no world existed at all. The growing awareness of this fact will eventually lead to a cooperative effort among all conscious beings to bring about the end of existence. Suicide would not be sufficient, as this would merely eliminate individuals, not the entire human species. And even the complete destruction of human life would not suffice, as other lifeforms would eventually become conscious and experience the same futility. Therefore, the proper goal would be for the total development of all particular wills to the point where consciousness would be developed to its fullest potential and where the final solution—the termination of all life itself—could be arrived upon through cooperative effort.

Von Hartmann thought this was the epitome of ethical thinking, as it gave a common end (teleology) that could truly unite all beings. Previous attempts to ground ethics upon formal principles, pursuit of pleasure, or transcendental wish-fulfillment were doomed to failure, because they are false and the evolving consciousness would see through such falsehoods eventually (see ETHICS AND UNBELIEF). Surprisingly enough, von Hartmann's advocacy of (eventual) mass destruction met with an enthusiastic audience, and his unique approach to pessimism made him a popular writer until his death in 1906. Among other things, von Hartmann was a strong critic of liberal Protestant Christianity, which he felt to be the last gasp of the Christian transcendental ethics. The Social Gospel movement, which tried to shift the emphasis of Christian teachings from the next world to bettering the present earthly condition, was merely a move from the second to the third stage of optimistic illusion.

A few reasons for von Hartmann's popularity include the clarity of his writing style, his usage of up-to-date scientific findings, and his rejection of the shallow religious and secular utopian movements of his time. In addition, the paradoxical view that human beings—and indeed all life-forms—could be united under one common project was appealing to those of a universalist point of view, even if that project was the end of all life itself. Still, after his own cessation of being, von Hartmann's writings fell into obscurity, and were superceded by more vehemently nihilistic movements of the twentieth century (see NIHILISM). Freethinkers can nonetheless benefit from his criticisms of transcendental escapism and reflect upon his objections to secular utopian visions.

TIMOTHY J. MADIGAN

HAWTON, HECTOR (1901–1975), English humanist and author. One of the most significant humanists in postwar Britain (see HUMANISM), Hector Hawton was born on February 7, 1901, into an ardently Protestant family and raised on *Foxe's Book of Martyrs* and *Pilgrim's Progress*. His father worked as a railway engineer. Partly in rebellion against his upbringing, Hawton converted to Catholicism at the age of fifteen. He remained a Catholic until his early thirties, when study of science and philosophy led him briefly to MARXISM before he became a humanist.

Hawton's career was built around his prodigious capacity to write. He worked as a journalist on Fleet Street before moving to Hampshire to earn his living as a writer, turning his hand to romantic fiction (under the pseudonym "Virginia Curzon"), children's adventures (under the pseudonym "John Sylvester"), detective stories (under the pseudonym "Jack Lethaby"), and serials for magazines. A feature of his novels was his ability to create three-dimensional female characters. During World War II he worked for Bomber Command's Group Four at Heslington Hall in York. He wrote two books on aspects of the Royal Air Force's war effort.

After the war, Hawton became active in the humanist movement. He was secretary of the SOUTH PLACE ETHICAL SOCIETY from 1948 until 1954, and was an active participant in the establishment of the INTERNATIONAL HUMANIST AND ETHICAL UNION in 1952. But it was in his work with the RATIONALIST PRESS ASSOCIATION (RPA) that his biggest contribution was made. Between 1953 and 1960 Hawton oversaw a radical downsizing of the RPA that saved the organization from financial ruin. At the same time, he guided the RPA's journal through one of its finest periods. Hawton edited the *Humanist* (he had dropped the previous title, *Literary Guide*) from 1953 until 1971, and again from 1974 until his death in 1975. During his editorship the *Humanist* was a very good magazine indeed, with a wide range of good quality articles from capable authorities. Most of the main thinkers of postwar Britain had an article in the *Humanist* at some time or other. And under a series of pseudonyms, Hawton contributed mightily himself. His most important pseudonym was "R. J. Mostyn," though "Humphrey Skelton," "James Plender," "George Robinson," "Jonathan Yeo," and "W. B. Pengelly" also discharged frequent assignments.

Hawton's unusually wide reading and clarity of style made his humanist books the best then available. His major nonfiction works include *Men without Gods* (1948); *Philosophy for Pleasure* (1949), which had a long career on the American paperback market; *The Thinker's Handbook* (1950), thought by many to be his best; *The Feast of Unreason* (1952), a brilliant demolition of existentialism; *The Humanist Revolution* (1963); and *Controversy* (1971).

Hawton continued to write fiction through these years, now mostly under his own name. And in his spare time he ghostwrote most of the books attributed to popular psychologist and fellow humanist Eustace Chesser. Chesser titles written by Hawton include *Love without Fear*, *Unmarried Love*, and *Grammar of Marriage*.

Hector Hawton was loved by his friends as a raconteur, drinking companion, and friend. He died on December 14, 1975. He was survived by his second wife, Mary Hawton (née Ferretti), and two sons.

HEINE, HEINRICH (HARRY) (1797–1856), German writer.

Life. Heinrich (Harry) Heine was born in Düsseldorf to tradesman Samson Heine and his wife, Betty, both assimilated Jews. From 1815 to 1819 Heine studied law at the universities of Bonn, Göttingen, and Berlin. In order to evade discrimination on account of his Jewish

heritage, he converted to Protestantism and changed his first name to Christian Johann Heinrich in 1825. In the same year he obtained his doctorate at Göttingen, but even armed with a baptismal certificate, he failed to find an employment as a civil servant. From 1825 to 1831 Heine lived as a writer in Lüneburg, Hamburg, Munich, and Berlin. Then he went into self-declared exile in Paris, where he worked as a correspondent for various German newspapers. After a physical collapse due to a still-unknown illness in 1848, Heine was confined to bed until his death in 1856. He is buried in Montmartre Cemetery.

Major Works. Heine's works deeply reflect the struggle between liberal and restorative forces of the *Vormärz*, the years between the German war of independence (1813–15) and the 1848 revolution. While his early publications, such as *Book of Songs* (*Buch der Lieder*, 1827), are characterized by romanticism, later texts display an increasingly ironic use of romantic style as well as a turn toward political subjects.

Heine gained fame with his *Pictures of Travel* (*Reisebilder*, 1826–31), in which he satirically criticized the contemporary German restoration, the government's attempt to shatter the achievements of Enlightenment and to restore pre-Napoleonic conditions.

French Affairs (*Französische Zustände*, 1833), an anthology of newspaper articles, describes the political and social conditions in post-revolutionary France. In it Heine also criticizes the German authorities' tightened censorship. Only two years later, the works of several liberal writers, among them Heine himself, were banned, accused of being destructive of morality and an assault on the Christian religion.

In later works, such as *Religion and Philosophy in Germany* (*Zur Geschichte der Religion und Philosophie in Deutschland*, 1835), Heine emerged as a leading opponent of the conservative alliance between clergy and nobility in Germany.

In the mid-1840s Heine wrote epic poems, especially "Germany: A Winter's Tale" (*Deutschland. Ein Wintermärchen*, 1844), attacking the authoritarian Prussian German state by contrasting it to an egalitarian earthly paradise. *The Gods in Exile* (*Die Götter im Exil*, 1852–53), one of his last works, compares pagan and Christian mythology. It can be regarded as a summary of Heine's conception of history, in which, just as Christianity replaced paganism, in its turn Christianity will be replaced by Communism.

HELL-FIRE CLUBS. "Hell-fire clubs" is the collective name for a style of underground club, established in the eighteenth century by members of the English aristocracy, that became notorious for black masses, orgies, and the consumption of inordinate quantities of alcohol. On occasions hell-fire club rampages ended up with people being killed, but the privileged social standing of the club members ensured that they escaped punishment.

The hell-fire clubs emerged alongside a movement of heretical Freemasons known as the Gomorgons, which parodied extravagant Masonic rituals. The first hell-fire club was founded in 1719 by two Freemasons, the duke of Wharton and the earl of Litchfield. Wharton was also a prominent member of the Gomorgons. The group, known as the "unholy twelve," met at the Greyhound Tavern in London before moving to the George and Vulture in 1746. Their tenure at the George and Vulture ended in 1749 when the pub burned down, probably after a club meeting got out of hand. This club went under a variety of satirical titles. At various times it was the Brotherhood of St. Francis of Wycombe, named after a leading personality, Sir Francis Dashwood, MP; later on it was known as the Monks of Medmenham, after the abandoned twelfth-century Cistercian abbey where the club met after 1755. One of the members had bought the site and rebuilt to it the fashionable gothic taste, whereupon it became a playground for the club. It disbanded in 1762 due to internal disputes and heavy outside pressure, but many new clubs, now openly called hell-fire clubs, formed in its place. At its peak it had included very senior British politicians including a prime minister and a chancellor of the exchequer, as well as the artist William Hogarth and the American diplomat Benjamin FRANKLIN.

A friend of Wharton's and possibly another Gomorgon was Richard Parsons, the first earl of Rosse, who created the first Irish hell-fire club in Dublin in 1735. The president of the club was called "the King of Hell" and the position of vice president was usually left vacant for Satan, to whom a toast was drunk. Other clubs were established in the United States. From this time on, the generic title "hell-fire club" was applied to aristocratic entertainments of this sort. Hell-fire clubs revived in popularity during the Regency period when, under the influence of the mercurial poet Lord BYRON, Dionysian excess became once again fashionable.

HELVÉTIUS, CLAUDE-ADRIEN (1715–1771), French philosopher and Enlightenment figure. A tax collector by profession, Claude-Adrien Helvétius was the son of a physician to the queen of France, which did not stop him from becoming a strong critic of both the French government in general and the monarchy in particular. He was one of the best-known figures of the French Enlightenment, and was on personal terms with Jean-Jacques ROUSSEAU, Denis DIDEROT, Jean LeRond D'Alembert, and VOLTAIRE—all of whom, however, distanced themselves from his outspoken criticism of religion.

Called an "atheist" by his critics (see ATHEISM), Helvétius was in fact a thorough-going materialist (see MATERIALISM, PHILOSOPHICAL). His *De l'esprit* (On the Mind), published in 1758, was an exploration of the origins and influences of human intelligence. It was based in part on the sensation psychology of John LOCKE, and agreed with Locke that the human mind at birth is a tabula rasa, or blank slate, which becomes activated by the various sensations it experiences. The book also revised the ancient philosophy of Epicureanism (see EPICURUS), arguing that human beings are motivated primarily by pleasure and pain, and construct a world of ideas based upon this. Interesting enough, he was also a forerunner of chaos theory—he argued that trivial and chance events could have far-reaching and unanticipated consequences. Helvétius reduced all human behavior to pure self-interest, which not only scandalized many of his fellow philosophes but enraged the powers that be as well. The Sorbonne (the theological faculty of the University of Paris) and the Parlement of Paris issued condemnations of the book, which was then publicly burned. It was also denounced by Pope Clement XIII. Helvétius was forced to recant and found it prudent to leave France, traveling first to England and then to Prussia, where he was welcomed by the Enlightenment emperor Frederick the Great. Even Frederick had qualms about Helvétius's radical materialistic and hedonistic views, which were similar to the views of Julien LA METTRIE, author of *L'Homme machine* (Man, a Machine), a fellow exile in Frederick's Berlin.

Helvétius was elected a member of the Berlin Academy, and while in that city wrote his second major work, *De l'homme, de ses facultés intellectuelles et de son éducation* (On Man, on His Intellectual Faculties and His Education), one of the major works in the philosophy of education. In it, he strongly criticized the views of Rousseau as found in the book *Émile*. He held that Rousseau was too elitist, and argued contra *Émile* that all people—women as well as men—are capable of being educated, and that the hope for human progress depends upon this. The book was not published until after his death.

One reason for Helvétius's unpopularity was his biting wit. "A man who believes that he eats his God," he wrote, "we do not call mad; a man who says he is Jesus Christ, we call mad." His advocacy of women's equality was influenced by his formidable wife, Madame Anne Catherine DeLingville Helvétius—renowned for her great beauty—who presided over one of the most famed salons in all of Paris. After her husband's death she had many admirers, including Benjamin FRANKLIN, who frequented her scandalous freethinking salon, which she ran until her death in 1800.

TIMOTHY J. MADIGAN

HENRY, JOSEPHINE K. (1846–1928), American freethinker, sex radical, and suffragist. Josephine K. Henry is credited with mobilizing support for Kentucky's Married Women's Property Act (1894). Her active role as a member of the revising committee of Elizabeth Cady STANTON's *Woman's Bible*, however, led to censure by state and national organizations of suffragists who believed her desire to liberate women from religious oppression would detract from their cause (see WOMAN SUFFRAGE MOVEMENT AND UNBELIEF).

Early Years. Born in southwestern Ohio in 1846, Josephine Kirby Williamson married William Henry and by 1870 had settled in Versailles, Kentucky, where she resided the remainder of her life. The music teacher began corresponding with Elizabeth Cady Stanton in the 1880s. As a freethinker her interest in such topics as birth control, divorce, dress reform, and sex education led Henry to join with Laura Clay as cofounder of the Kentucky Equal Rights Association (KERA) in 1888. A powerful speaker and writer, she became increasingly politicized while agitating on behalf of women's rights, and in 1890 Henry became the first Kentucky woman to run for state office when she stood as the Prohibition Party's candidate for clerk of the Kentucky Court of Appeals. Four years later she received the nomination for state superintendent of public instruction.

Married Women's Property Act. In 1890 Kentucky was the only state in which married women had no property rights. They could not make wills, receive the wages they earned, or be the guardians of their children. Henry,

convinced that women's economic independence must precede suffrage, campaigned tirelessly for the Married Women's Property Act, which passed in 1894.

The Woman's Bible. Stanton provoked significant controversy in 1895 with the publication of the collaboratively authored *The Woman's Bible*, a commentary on key biblical passages pertaining to women. One of Stanton's most vocal supporters, Henry condemned the church for demanding everything of woman while giving her little in return. As a result of her participation on this project, both the KERA and the North American Women's Suffrage Association (NAWSA) ostracized Henry.

Later Years. Undeterred by the criticism her work on *The Woman's Bible* engendered, Henry devoted herself to writing and published *The New Woman of the New South* (1895), *Woman and the Bible* (1905), *Marriage and Divorce* (c. 1905, dedicated to sex radical physician Edward Bliss FOOTE), hundreds of newspaper articles, and a work of poetry titled *Musings in Life's Evening*. In 1920 NAWSA awarded her a Pioneer Distinguished Service certificate. She died in Versailles in 1928.

JOANNE E. PASSET

HERDER, JOHANN GOTTFRIED VON (1744–1803), German historian, philosopher, and theologian. Johann Gottfried von Herder's first work (the *Fragmente* of 1767) is essentially a plea that works of literature should not be judged by absolute standards, but understood in the light of the historical conditions of their time. Better known are his views on language. After early arguing that it is a human invention, he repudiated, in a famous prize essay of 1772, both this view and the claim that language is of divine origin. This attempt to give it a natural foundation without invoking invention led him into quite unsustainable arguments.

Many of Herder's writings in the five years from 1771 to 1775 are marked by a strong religious enthusiasm, quite different from the more rationalistic cast of his earlier period and of his time in Weimar from 1776. Schweitzer (referring to the 1780–81 *Letters on the Study of Theology*) noted that Herder recognized that the first three of the canonical gospels are incompatible with the fourth. His writings on the Old Testament treat much of its material as oriental poetry, not to be taken seriously as science or philosophy. Cheyne noted that Herder, with J. G. Eichhorn, established "the custom of referring to the 'orientalism' of the Scriptures, which the traditional orthodoxy had been accustomed to regard as in all senses unique." His *The Spirit of Hebrew Poetry* (1782) was still considered worth translating into English fifty years later.

The History of Civilization. For Herder, neither literature nor theology can be understood except in the light of history; and so it is not surprising that his greatest achievement lies in his work as historian. Whereas his *Another Philosophy of History as a Contribution to Human Culture* of 1774 is no more than a polemic against deists and rationalists (see DEISM; RATIONALISM), his *Ideas on the Philosophy of the History of Mankind* (published in four volumes between 1784 and 1791) is a history of civilization up to the time of the Crusades, embodying many years of historical and scientific research. The whole burden of its opening sections is to show by comparing human being, body and mind, with other animals that we are a natural species, and that human behavior must be understood in the same way as that of any other creature. Herder argued along these lines long before the theory of evolution was well established to support him (see EVOLUTION AND UNBELIEF). Indeed, he regarded species as immutable.

The final sections of the work include an orthodox account of the origin of Christianity but a very unorthodox account of its development, including the judgment that Edward GIBBON had treated the subject with "great mildness." It may well be that a planned fifth volume, covering world history from the Crusades to the French Revolution, was never written because as court preacher of Protestant Weimar, Herder could not afford to be as outspoken about the Reformation as he had been about the Catholic Church.

The four published volumes conclude with a confident assurance that the advance of reason is continuing and bodes well for the future of humankind. Such optimism seems strange today, but it was natural that Herder should be struck by the superiority of the eighteenth to earlier centuries; and it was easy for him to show that this superiority depended on an increase in knowledge.

In Herder's final years the increasing popularity of the Kantian philosophy, which he bitterly opposed, served to isolate him. In his view, reason cannot transcend experience, and this struck at the very roots of Immanuel KANT's doctrine of a priori knowledge. Kant himself was well aware that the kind of anthropology pursued by Herder would be dangerous to the new philosophy, and did his best to discredit him. In any case, Herder's attempt to explain human affairs in terms of natural laws could hardly find favor in an age when the laws underlying even geological phenomena had not been properly grasped, and when biology, and chemistry, too, were relatively backward.

GEORGE A. WELLS

HERESY. Defined as the crime of holding minority opinions in a closed society, heresy is not the same as BLASPHEMY, which traditionally involved reviling the name of God or outraging fundamental religious sensibilities. Heresy is the profession of unacceptable doctrines while accepting the fundamental tenets of the faith. This means that heresy is always relative to whatever orthodoxy is being defended. It also means that heresy is very largely a problem confined to cultures dominated by a monotheistic brand of religion or universalizing ideology that is not prepared to brook any rival interpretation of reality. In a free society where all manner of thought is encouraged, heresy is impossible. It is not accidental that the word is derived from the Greek *hairesis*, which means "choice" or "able to choose." In the Asian traditions of Hinduism (see HINDUISM AND UNBELIEF), Buddhism (see BUDDHISM, UNBELIEF WITHIN), CONFUCIANISM, and Taoism (see TAOISM, UNBELIEF WITHIN), it is well nigh impossible to find space for the concept of heresy, because these traditions do not revolve around notions of one god whose message is inscribed in scripture. Without these absolute pillars of belief, obedience to which constitutes the measure of one's orthodoxy, the holding of divergent opinions is, at worst, an occasion of disapproval.

But in the monotheistic religions, it matters a great deal what the scriptures say, and who has the power to enforce the prescribed interpretation. It was with this in mind that the philosopher Baruch SPINOZA observed: "No heretic without a text." Ironically, one of the earliest uses of the notion of heresy is in the New Testament itself, and against Christians. Acts 24:5, for example, which refers to the "sect of the Nazarenes," should, if translated accurately, read "the hairesis of the Nazarenes," which places the emphasis not on the sect but on the beliefs (*hairesis*) that characterized that sect. In the tolerant world of Roman polytheism, no opprobrium was attached to the term, a condition that would not last.

The persecution of heresy derived its scriptural warrant from passages such as John 15:6, which states: "If a man abide not in me, he is cast forth as a branch, and is withered; and men gather them, and cast them into the fire, and they are burned." And 2 Peter, one of the latest works included in the New Testament, warns against false prophets and damnable heresies. The author of Peter was anxious to hold together the infant Christian community in the light of Christ's failure to return in the lifetime of his hearers. Those who interpreted this failure in ways perceived to threaten church unity were, accordingly, labeled heretics. The church fathers set a tone of fanaticism. One of the first written condemnation of heretics was from Irenaeus of Lyons, who attacked the Gnostics in *Against Heretics*. Saint Jerome declared that anyone against the church was by default with Satan, and as such had relinquished the right to life. And Saint Augustine distinguished between unjust persecution, which the impious commit against the church, and just persecution, which the church commits against the impious. In a letter to the tribune Boniface in 417 CE, Augustine noted that the church "persecutes out of love and the impious out of cruelty."

Until the fourth century CE, the charge of heresy amounted to little more than a stratagem in factional quarrel, about which little could be done since neither party exercised coercive power. But when Christianity became the official religion of the Roman Empire, being labeled a heretic became a lot more dangerous. Constantine is usually counted as the first Roman emperor to publicly embrace the Christian religion. The Council of Nicaea, over which he presided, helped to solidify the officially sanctioned dogma of the church. This made it easier, and more deadly, to identify as heretics those whose views differed. It also meant that churches identified as heretical could lose the tax exemption enjoyed by their orthodox neighbors.

But while Constantine was credited as the first emperor who embraced Christianity, it was Theodosius who declared Christianity the official religion of the empire, on February 27, 380. Within five years the first known execution of a heretic Christian took place. In 385 Priscillian, a Spanish bishop, scholar, and ascetic, was executed with official sanction because of his views. Theodosius's declaration was followed by a succession of increasingly draconian decrees against all unorthodox variants of Christianity as well as non-Christian beliefs and practices. In the Theodosian Code of 438 it was decreed simply that all "heresies are forbidden by both divine and imperial laws and shall forever cease." Almost a century later, in 529, Justinian closed down PLATO's Academy and all other sources of learning where people might be able to choose what to believe about the world. The closing of the Academy is taken by many historians as an appropriate symbolic date for the

start of the Dark Ages. By now there was a relatively coherent understanding of what constituted heresy. In the Gothic successor states to the western Roman Empire, it was Nicaean Christians who were the heretics, but in the eastern Roman Empire it was the Arians. In the end, the greater ability of the eastern empire to enforce its will ensured that its views as to who was the heretic would triumph.

There is no exact equivalent with the concept of heresy in Islam (see ISLAM, UNBELIEF WITHIN), although there are a couple of close parallels. The Arabic word *Bid'a* literally means "innovation" but, revealingly, has come to mean heresy. Technically, however, *Bid'a* does not denote heresy; not all innovation is inevitably seen as heretical, although conservatives have been happy to use the term in that context for centuries. The closest parallel is *Ilhad*, although this word can also be translated as "apostasy." *Ilhad* means a deviation from the correct path. Apostasy can also be translated as *Irtidad* and *Ridda*.

Part of the explanation of the lower prominence of the notion of heresy in Islam is that there are fewer core tenets of Muslim belief that can become a focus for dispute than is the case in Christianity. The Christian view of Jesus as God's son generated a large body of doctrine, culminating in the Trinity, the purpose of which was to clarify and explain this relationship. But inevitably, it also provided rich pickings for alternative interpretations. The losers of these struggles earned the title "heretic" and suffered accordingly. But within Muslim thought, any questioning of core tenets of belief meant the challenger was less able to be seen as a heretic, in the sense of questioning aspects while remaining loyal to the rest of the doctrine, and more of an apostate, one who rejects the entire Muslim corpus.

It is also interesting to see close parallels within the world of communism. The large body of doctrine, the changes over the years from Karl MARX, through Vladimir Ilyich LENIN and Joseph Stalin and on to Mao Tse-tung, allowed for a plethora of different interpretations. And this in turn allowed for the closest imaginable secular parallel to heresy. The labels used to brand opponents—"right-wing deviationist," "leftist adventurer," and, the ultimate crime, "Trotskyite"—all carried the same subtle shifts in emphasis and coded information as to the nature of the opinion being denounced. But in the end, it was simply the wish of the victors that counted.

These digressions notwithstanding, it remains that heresy is primarily a phenomenon of Christian history and practice, and so we will return to our historical survey of heresy in the Christian context. It was Pope Innocent III who set the extirpation of heresy onto a new footing. Many people had suffered for their opinions before, but Innocent raised the stakes when, on March 25, 1199, he declared heresy to be high treason against God, and that the children of heretics "are to be subjected to perpetual deprivation for the sins of their parents." From the beginning there was a capricious element to this process. When faced with two reform movements espousing similar ideas of returning to Christlike simplicity and austerity, one group—the Waldensians—was declared heretical, while the other—the Franciscans–was accepted into the structure of the church. Half a century after the death of Saint Francis in 1226, this would change when his more puritanical followers, known as the Spirituals, fell foul of the church and were persecuted as heretics.

The persecution of heresy reached a new frenzy when Innocent III was faced with a popular French heretical movement known as the Cathars. Innocent reacted brutally, declaring in 1208 that the war against them was a Crusade. By this declaration, all the rewards of absolution for crimes committed while fighting that had traditionally been given to those who had slaughtered Muslims was now extended to those fighting fellow Christians. Over the next two decades, fighting of the utmost savagery reduced Provence to a wasteland. But the heretics were crushed.

Innocent oversaw harsh legislation against heretics at the Fourth Lateran Council in November 1215. Encouraged by Innocent's successor, Pope Honorius III, harsh penalties on heretics were enacted by Frederick II in 1220 and by Louis VIII six years later, while he was finishing off the last remnants of the heretical Cathars. Innocent III having reestablished the elimination of heresy as a papal priority, the scholars set to work to clarify once more what heresy consisted of. Thomas Aquinas spoke of heresy as "a species of infidelity in men who, having professed the faith of Christ, corrupt its dogmas." He went on to distinguish two types of heresy: refusing to believe in Christ himself (a failing he attributed to pagans and Jews), and retaining some items of Christian belief while rejecting others. During his struggles with the Spirituals, Pope John XXII issued a bull defining heresy as "any baptized person who, retaining the name Christian, pertinaciously denies or doubts one or another truth believed by divine and catholic faith." Most medieval heretics saw themselves as the true followers of Christ's teaching, which they usually interpreted as involving poverty, simplicity, and a distrust of things of the flesh and priestly hierarchies.

The papal concern with the extirpation of heresy fueled the development of what became the Inquisition. The first reference to the title of inquisitor was at the Council of Tours in 1163, which was preoccupied with the Cathars. On November 4, 1184, Pope Lucius III's *Ad abolendum* decretal spoke of the need to "make inquisition" for heresy. The work of the Inquisition was helped in May 15, 1252, when, in *Ad Extirpanda*, Innocent IV permitted the torture of heretics. Amended versions of this bull allowed the inquisitors themselves to be present at the torture. It was not until 1816 that the papacy finally condemned the practice of torture.

The papal initiative was followed with varying

degrees of enthusiasm around Europe. It was not until 1400 that official recognition of heresy was established in England. That year the English king, Henry IV, agreed to clerical demands for bishops to be granted harsh new powers of arrest and detention of anyone whom they accused of heresy. Church authorities moved so quickly that their first victim, William Sawtre, a follower of John Wycliffe, was burned on March 2, 1400, eight days before the Statute of Heretics was officially passed. Henry V strengthened the already generous clerical powers in 1414, and for the next two hundred years innumerable people went to the flames in the name of true religion. The last burning of a heretic in England took place in 1610, and the statute was finally abolished in 1677, although ecclesiastical courts retained the power to bring people to trial for heresy. Witches, who technically were not heretics, were burned for another century. And in 1698 a harsh statute was passed under which any person found guilty of criticizing Christianity was liable to face a wide range of penalties, including ineligibility to hold public office, purchase land, or take legal action. This statute only encouraged critics of Christianity to write their criticisms in oblique ways. A popular method was to criticize Roman Catholicism or Islam in the name of "true religion," while allowing readers to draw the conclusion that the criticisms applied to all Christianity.

The persecution of heresy reached its apogee in Europe in the century preceding the Treaty of Westphalia in 1648. Charles V enacted a comprehensive law against heresy in the Holy Roman Empire in 1523, and the Hapsburg monarch Philip II of Spain put renewed emphasis on the extirpation of heresy. France at this time suffered eight wars of religion between Catholics and Protestants, known as Huguenots. The hatred reached its peak on August 23 and 24, 1572, when twenty thousand Huguenots were massacred in Paris in what became known as the Massacre of Saint Bartholomew. Pope Gregory XIII celebrated the event with a solemn *Te Deum* and thanksgiving events. Philip II was said to have laughed when he was told of the slaughter. The religious bloodletting continued on to the Thirty Years' War (1618–1648), which had the dubious honor of being the bloodiest war in European history until the First World War. The war left Germany severely underpopulated and impoverished, and it took a century to recover fully.

The Reformation fatally undermined the ideological foundations upon which the idea of heresy rested. Once Protestantism was established as a credible alternative to the hierarchy of Rome, it was no longer possible to argue that all civil and moral order could be thought to rest on one mode of belief. On April 15, 1598, the Edict of Nantes gave French Huguenots a degree of religious freedom and served as an example of how people of different faiths could live together. The edict was revoked in 1685, leading to an exodus of Huguenots from France. This provided the next lesson: that religious toleration also allows for greater prosperity than coerced uniformity. And during this century, the scientific revolution comprehensively undermined the limited, geocentric universe as understood by medieval Christians (see RELIGION IN CONFLICT WITH SCIENCE). This allowed more scope for divergent views as to how the Christian scriptures could be interpreted.

In the decades following the end of the Thirty Years' War, the growing disgust at slaughter in the name of religion—combined with the realization that there are many ways a Christian may worship—encouraged the search for a new way of interpreting scripture. Spinoza, himself branded a heretic by the Jews of Amsterdam, offered a radical solution. Writing in the 1670s, Spinoza said that it is not the purpose of government to "change men from rational beings into beasts or puppets, but to enable them to develop their minds and bodies in security, and to employ their reason unshackled; neither showing hatred, anger, or deceit, nor watched with the eyes of jealousy and injustice. In fact, the true aim of government is liberty." Spinoza articulated the principal political conclusion drawn from the terrible wars of religion: mixing religion and politics is dangerous. In the century following Spinoza, there arose a greater willingness to criticize openly the crimes of religion. VOLTAIRE began a study of heresy by noting that it "is not greatly to the honor of human reason that men should be hated, persecuted, massacred, or burned at the stake, on account of their chosen opinions."

The collapse of the worldview which gives rise to notions like heresy became apparent in the nineteenth century when the Englishman John Henry Newman, who converted to Catholicism and became a cardinal, claimed that it was better for the universe to expire than for one venial sin to be committed. Only in the closed world of nineteenth-century Catholicism could such a pronouncement be understandable. Pope Pius IX did what he could to give meaning to Newman's wish when he published, on December 8, 1864, the *Syllabus of Errors*, a comprehensive condemnation of all the thoughts that sustained the modern world.

The popes who followed Pius IX proved just as amenable to this hardline approach. Pius X oversaw the production of the *Institutes of Public Ecclesiastical Law* (1901), which supported the death penalty for "obstinate heretics and heresiarchs." While they were no longer in any position to give effect to this wish, the church was determined to operate with the harshest possible iron fist, as the biblical scholar Alfred Firmin LOISY discovered to his cost. Loisy devoted his scholarly life to defending Catholicism from Protestant claims that it distorted the teachings of the apostles. But doing so involved accepting some of the tenets of biblical scholarship, in particular jettisoning any dogmatism about biblical inerrancy (see BIBLICAL ERRANCY). In 1908 Loisy was excommunicated for his efforts.

Outside the Catholic Church, the idea of heresy was taking on newer, lighter meanings. By the beginning of

the twentieth century, people felt able to describe themselves as heretics and expect to be applauded as rebels. The holding of unconventional opinions, self-described as heresy, became a badge of honor, a practice the conservative English journalist G. K. Chesterton lamented in a book he called *Heretics*. Such people, Chesterton wrote, have philosophies that are "quite solid, quite coherent, and quite wrong." Chesterton's bluster notwithstanding, it was apparent that heresy had ceased to be a crime of substance, because those making the charges no longer had the coercive power to back them up. At the Second Vatican Council, even the Catholic Church tried to acknowledge the new spirit of the times when it asserted, however dubiously, that "it has always been the teaching of the church that no one is to be coerced into believing."

For a while after World War II, it looked as if heresy could be consigned to the history books, at least in the Western world. Churches can still instigate heresy trials, and occasionally do. In 1906 the Episcopalian Church of America charged one of its clergymen, Algernon Sidney Crapsey, with heresy. He was found guilty and expelled from the church. Crapsey continued his career as a state parole officer and peace campaigner. And in New Zealand, the Presbyterian Church charged one of its prominent theologians, Lloyd Geering, with heresy in 1967. Geering was acquitted and went on to have a successful career as a public intellectual and religious humanist. During the pontificate of John Paul II, the Catholic Church moved away from many of the liberalizing moves of the Second Vatican Council. This was best illustrated when, in 1979, John Paul II revoked Hans Küng's authority to teach as an officially recognized Catholic scholar because he criticized papal infallibility. Like Crapsey and Geering, Küng went on to have a very successful career. But as many Christian denominations drift back to conservative positions, it would be premature to predict the end of heresy. But the closed, geocentric understanding of the universe that gave rise to the notion of heresy has gone forever.

HETHERINGTON, HENRY (1792–1849), English religious reformer and freethinker. Known as "the poor man's guardian," Henry Hetherington was born in Soho, London, and as a youth was apprenticed to Thomas Hansard, son of the printer of parliamentary reports that now bear his name. After release from his apprenticeship, Hetherington went to Belgium in search of work and was caught up in radical politics. He returned to London after two or three years, set up a printing business, and immersed himself in radical politics. His first important contribution was the publication in 1828 of the pamphlet *Principles and Practice Contrasted: or, A peep into the only true Church of God upon Earth, commonly called Freethinking Christians*. He accused Freethinking Christians of hypocrisy in their attempt to reconcile scientific knowledge with religious belief. Hetherington also published a lot of material for the emerging trade union movement.

Hetherington found his true vocation in opposing the Stamp Tax on newspapers. The Six Acts of 1819 had required publishers to deposit substantial bonds as guarantees of good behavior, and a four-penny duty was imposed on all regular newspapers. These restrictions became known as the taxes on knowledge and generated sustained opposition. Between 1830 and 1835 Hetherington led a nationwide opposition to the tax, going to prison several times in the process. In 1831, after his first spell in prison, Hetherington set up a weekly paper, the *Poor Man's Guardian*. It sold for one penny, with no extra charge to pay the Stamp Tax. During the course of the campaign against the taxes on knowledge, more than six hundred people were imprisoned for selling the *Poor Man's Guardian*. The campaign wound down after the stamp duty was reduced to one penny in 1836.

Hetherington then turned his attention to British blasphemy laws. In 1840 he was brought to trial for distributing pamphlets that some Church of England authorities had decided were blasphemous (see BLASPHEMY). Hetherington conducted his own defense with great vigor and skill, but there was never any doubt he would be found guilty. Once again he went to prison. After his release, he resumed publishing heretical tracts, including VOLTAIRE's *Questions of Zapota*; Atheos's *Atheism Justified*; and his own works, *Is Man a Free Agent?* and *A Few Hundred Bible Contradictions*. Hetherington was working actively for the Chartist movement when he died in the cholera epidemic that swept through London. The Chartists were working-class radicals seeking an extension of democratic rights to people of their class. Hetherington died on August 23, 1849, and in his will he declared himself an atheist (see ATHEISM; DEATHBED CLAIMS CONCERNING UNBELIEVERS).

BILL COOKE

HEYWOOD, EZRA H. (1829–1893), American atheist, pamphleteer, and editor. The son of Ezra and Dorcas (Roper) Hoar took the name Heywood several years after his father died in 1845. A Princeton, Massachusetts, native, he earned an undergraduate degree from Brown University in 1855 and a master's degree one year later. Heywood spent two additional years at Brown preparing for the Congregational ministry, but left the church in 1858 as a result of his exposure to the abolitionist involvement. A radical Garrisonite, he believed in the perfectibility of humankind and became an early advocate of women's rights; a pacifist; a free-lover (see SEX RADICALISM AND UNBELIEF); a freethinker (see FREETHOUGHT); and, after meeting Josiah Warren in 1863, an individualist anarchist (see ANARCHISM AND UNBELIEF). As editor of a radical reform newspaper titled the *Word* (1872–93), he shared his freethought and free speech convictions with a national readership and became a leader within the post–Civil War sex radical community.

An uncompromising reformer, Heywood married the like-minded Angela Fiducia Tilton, in Worcester, Massachusetts, in 1865, and they had four children: Hermes, Angelo, Vesta, and Psyche. The Heywoods moved to Princeton, Massachusetts, in 1871 and established "Mountain Home," a summer hotel that accommodated such sex radicals and freethinking spiritualists as Stephen Pearl Andrews and Josiah Warren. While ostracized by neighbors, Heywood nonetheless earned respect for his kindness, integrity, and devotion to his family. Working as partners, the Heywoods established the Co-Operative Publishing Company, and with only the help of their children published the *Word* and a host of radical pamphlets, including a condemnation of marriage titled *Cupid's Yokes* (1876), *Uncivil Liberty* (1870), and *The Great Strike* (1878).

Dedicated to reform, Ezra and Angela Heywood played key roles in founding the New England (1869) and American (1871) Labor Reform Leagues, the New England Free Love League (1873), the New England Anti-Death League (circa 1878), and the Union Reform League (1879), an organization that supported land reform, freethought, repeal of the Comstock laws (see COMSTOCK, ANTHONY, AND UNBELIEF), women's rights (see WOMAN SUFFRAGE MOVEMENT AND UNBELIEF), and dress reform. After founding the New England Free Love League, Heywood began dating his correspondence and issues of the *Word* with Y. L. (Year of Love) instead of A. D.

As a free-lover, freethinker, and advocate of free speech, Heywood endured prosecution five times under the Comstock Act for mailing obscene publications. He steadfastly refused to censor contributors like his wife, who freely used words like "fuck" and "cunt," and he defiantly published advertisements for contraceptive devices. Arrested and convicted in late 1877, he served six months in the Dedham, Massachusetts, jail before being pardoned by President Rutherford B. Hayes in mid-1878. Arrested again in 1882, 1883, and 1887 on obscenity charges, he successfully eluded conviction until 1890, when a judge sentenced him to a two-year term in the Charlestown, Massachusetts, state prison. Worn down from this prison sentence, Heywood nonetheless continued to participate in reform conventions until his death, which came one year after his release. Freethinking friends and family members honored his wish for a freethinker's funeral, commemorating his life with tributes rather than prayers and scripture readings.

JOANNE E. PASSET

HIBBERT, JULIAN (1801–1834), English freethinker and philanthropist. Befitting his privileged background, Julian Hibbert was educated at Eton and Trinity College, Cambridge, England's two most prestigious educational institutions. Hibbert studied classics at Cambridge and was admitted to Lincoln's Inn to train for the law, although he never practiced.

His privileged background notwithstanding, Hibbert was a rebel with respect to matters of religion. At the age of only twenty-four, he began contributing to papers most of his associates would have considered dangerously radical. Chief among them was the *Republican*, run by Richard CARLILE, for which Hibbert wrote a series called *Theological Dialogues*. He was also a supporter of Robert TAYLOR, a former priest who was known as the "Devil's Chaplain," and of Robert OWEN. And perhaps most radical of all, he also wrote for Henry HETHERINGTON's *Poor Man's Guardian*. Hibbert was especially concerned to challenge the prejudice common among his peers that propagating freethought among the working classes some somehow seditious. One of his main essays was "On the Supposed Necessity of Deceiving the Vulgar."

In 1826 Hibbert set up a printing establishment with a view to publishing freethought material. He had plans for a range of reference and other works, most of which

never began or were cut short by his untimely death. A biographical dictionary of freethinkers was never started and a *Dictionary of Modern Anti-Superstitionists* was published in 1826, but got only halfway through the letter *A*. Hibbert also put his classical education to good use in books like *Plutarchus and Theophrastus on Superstition* (1828).

Hibbert's other important contribution was his financial contributions to Richard Carlile during the latter's years of imprisonment for publishing Thomas PAINE's *The Age of Reason*. Carlile's courage would not have been sufficient without Hibbert's generous support to keep his publishing business afloat during his incarceration.

Hibbert worked staunchly for freethought throughout his last illness. In 1833 he was subpoenaed to a London court, where his ATHEISM was publicly condemned. The magistrates sat by while the sick man was led away amid hisses and abuse from the crowd. Julian Hibbert died in December 1834. He left generous bequests for his freethought comrades in his will.

BILL COOKE

HINDUISM AND UNBELIEF. Two qualifiers make this essay difficult. *Hinduism* is a Western concept imposed on a subcontinent whose classic languages have no useful word for *religion*. And those life views that Westerners have called *religions* in India have always been plural, and usually without central authorities who could define "right belief." We will here treat *unbelief* as the rejection of classical traditions in favor of modern, naturalistic, and scientific views (see NATURALISM; RATIONALISM).

Ancient Unbelief. Northern invaders imposed "Vedic" polytheisms upon local tribal beliefs in the second millennium BCE. Historical writings are skimpy in India, but several alternative ideologies and practices such as Buddhism (see BUDDHISM, UNBELIEF WITHIN) and Jainism emerged around 500 BCE. That will allow us to outline the dominant background of the continent.

These early innovators rejected a highly stratified caste system and an already sizable pantheon of gods. They also rejected a revelational treatment of certain memorized texts (said to have been "seen" whereas lesser texts were simply "heard"). But they continued the downgrading of ordinary realities in favor of a superior mental-spiritual realm being set forth in contemporary *Upanishads*. This bias included a downplaying of family, sexuality, and social order in favor of a solitary discipline that would lead individual men to enlightenment. However, the innovators retained the idea of samsara, the expectation of many rebirths until release from earthly suffering had been achieved. That goal represented not an individual immortality, but an absorption into an "All" or an enlightenment that was a dissolution of all components of any "self." Finally, the innovators retained the idea of karma, the belief that a ledger of the accumulated effects of one's good and evil deeds is somehow retained to influence one's future lives.

The result was a potential Hindu agnosticism, as can be seen in a famous concluding stanza of the *Rig-Veda*:

> This world-creation, whence it has arisen,
> Or whether it has been produced or not,
> He who surveys it in the highest heaven,
> He only knows or ev'n he does not know it.
>
> X.129

Later Religious Migrations. Small Jewish and Christian immigrations to India occurred without major impacts on existing worldviews. Later and larger Muslim invasions proved more disruptive. Zoroastrians fleeing Islam in Iran settled in western India (where they would become known as Parsis). Sikhism emerged, blending some Hindu and Muslim strands. French, Portuguese, and particularly British invaders later proved hostile to indigenous religious thought.

The twentieth-century scholar Dale Riepe traced the emergence of naturalism in Indian thought, using the term in its current philosophical sense. His treatment of the Ajivika, CARVAKA, and Samkhya schools of thought shows their relationship to Buddhism and Jainism and suggests Hellenistic parallels (without claiming any direct influences). Riepe's method is to compare theories of knowledge, metaphysics, and ethics. The still-standard treatments of Indian thought by Dasgupta and Radhakrishnan also made much of parallelisms, writing sympathetically of ways in which Western philosophical idealism could relate to Hindu schools of thought. As Riepe put it, that idealism "tried to make pleasant an imaginary life when the natural one was frequently intolerable."

On the ethical level, British (and therefore Christian) influences in the nineteenth century generated reform movements such as Brahmo Samaj, which rejected caste and widow immolation and welcomed Western science. Ramakrishna claimed to have reached the same goal of enlightenment by a variety of Hindu paths as well as those of Christianity and Islam, and his disciples created a movement that remains both social reformist at home and missionary throughout the world. These and other reform movements, while moving away from temple Hinduism and more polytheistic practices, have retained most of the classical Indian theories of knowledge and the distinctions between an apparent world and a more real spiritual one.

The British Christianity that impinged upon India had already learned to live with renaissances, reformations, and modern science. As Surendra Ajnat viewed it, "The

so-called Dynamic Brahmanism which survived the onslaught of many alien conquests and religious conversions could not withstand the trend of westernization which is exerting an abiding and all round pressure for rationalistic regeneration even to-day."

Subhayu Dasgupta was similarly sharp in describing this impact: "The Hindu personality, that for long remained conformist, submissive and authoritarian, had his baptism in independent thinking and rationalism. The rejection of scholasticism and apriori knowledge inherited from the past in favour of the findings of science, rights of human dignity against the hierarchy of castes and the growth of an enquiring mind which asked for rational explanation for all events, social or natural and refused to be satisfied by the supernatural or the mystic marked the stages of social transition in India."

One response to the challenges of the West was the *Arya Samaj*, emphasizing the superiority of traditional Hindu practices. Sarvarkar's *hindutva* movement in the 1920s made the dividing line whether a group viewed India as "home." Islam was, and remains, the principal intractable "foreigner" in the view of this ideology.

Regional-linguistic differences, caste stratifications, interreligious tensions, and economic grievances formed the backdrop for the nationalist movements of the twentieth century. Whether Indians should support Britain became problematic for independence movements during both the world wars.

Religiously, independence leaders took different paths. Gandhi's education in the West led him to nonviolence, to a rejection of caste, and to a pluralistic view of religious equality. This is illustrated by the fact that his assassin was a Hindu nationalist. Nehru's education instead led him to a scientific humanism. As he put it: "The diversity and fulness of nature stir me and produce a harmony of spirit and I can imagine myself feeling at home in the old Indian or Greek pagan and pantheistic atmosphere, minus the conception of God or Gods that was attached to it."

M. N. Roy became a socialist and a member of the first Comintern. Eventually he broke with Joseph Stalin and moved toward a radical democratic view that allowed him to join the Indian Congress movement, which was then pressing for greater local autonomy under British rule. Roy was an uneasy member of Gandhi's Congress; during World War II his opposition to fascism led him to support the British, a stance many Indian activists found perverse. But Roy's confidence, eventually borne out by events, was that a socialist postwar British government would free India.

In 1940 Roy quit the Gandhi-Nehru Congress to form the Radical Democratic Party. By 1946 he had issued a manifesto stating: "[T]he quest for freedom is the continuation, on a higher level—of intelligence and emotion—of the biological struggle for existence. The search for truth is a corollary thereof. Increasing knowledge of nature enables man to be progressively free from the tyranny of natural phenomena and physical and social environments."

Finally, in 1948, having come to view parliamentary parties as inadequate, Roy created the Radical Humanist Movement.

Traditional Hinduism rooted morality in custom and dharma. Roy rejects that past, saying: "Reason is only sanction for morality, which is an appeal to conscience, and conscience, in its turn, is the instinctive awareness of, and reaction to, environments. . . . Humanism is cosmopolitan. It does not run after the utopia of internationalism, which presupposes the existence of autonomous National States."

Other important Indian pioneer unbelievers were Periyar, who founded a Dravidian organization in 1929, and Gora, who founded the Atheist Centre in 1940 (see India, Unbelief in). While many of their writings have appeared in English, their successes in building movements depended upon their use of regional languages. This is still the case.

Most of the present movements, regional and India-wide, have affiliated with the International Humanist and Ethical Union now based in London. Their names and themes typically use words such as rationalist, secular (see Secularism), radical humanist (see Humanism), and atheist (see Atheism).

Typical activities of the unbeliever groups concern rejection of caste divisions and the encouragement of intercaste marriages; the social defense of *dalits* (untouchables); support for birth control; attacks upon traditional dowry killings of brides; and opposition toward child labor. There is also concern for equalizing the status of women (including critique of Muslim divorce customs). In addition, there is a recurrent "no-god" theme and persistent campaigns against "god-men" and gurus who claim magical powers. All of these concerns also revolve around pressing for educational access for both boys and girls.

Emphases such as those just listed remind us that unbelief always emerges within a particular context of beliefs. It should also remind us that human history is seldom a smooth advance from belief to unbelief in which reason and science and rational ethics supplant more "primitive" thinking. A more accurate accounting of history shows us that every success toward secularization stirs up strong resistances, and that the strengthening of religion A not only slows secularization within that context but stimulates strengthening within religions B , C, and the rest. In India, politicized Islam and politicized Hinduism feed on each other, while the officially "secular" constitutional society finds itself threatened by both. Whether unbeliefs within such religions will succeed is never assured—their survival and progress continue to depend upon fresh ideas and fresh leaders.

ROBERT B. TAPP

HOBBES, THOMAS (1588–1679), English philosopher and political scientist. Born the second son of a wayward country vicar, Thomas Hobbes was sustained throughout a long life of many writings by the patronage of the great, mainly by William Cavendish, first earl of Devonshire. The only nearly complete edition of the works of Hobbes was by the philosophical radical Sir William Molesworth. It begins with a translation of Thucydides' *History of the Peloponnesian War* and ends, when Hobbes was in his late eighties, with translations into English verse of both the *Iliad* and the *Odyssey* of Homer.

Like John LOCKE and Immanuel KANT, but unlike George Berkeley and David HUME, Hobbes matured late. His friend John Aubrey tells in his *Brief Lives* how the intellectual awakening of Hobbes occurred in a gentleman's library, when he chanced upon the theorem of Pythagoras in Euclid. That, instantly sweeping him away by its irresistible deductive power, made him fall in love with geometry. This rationalist inspiration, mated with his theoretical concern with politics, enabled him to recognize Thucydides as "the most politic historiographer who ever writ."

The first birth of this union was "a little treatise in English" of which "though not printed, many gentlemen had copies." Since its immediate implications were royalist, in the assembly of the Long Parliament in 1640, "Mr. Hobbes, doubting how they would use him, went over into France, the first of all that fled." There philosopher-mathematician Marin Mersenne immediately persuaded him to write the *Third Set of Objections* to be published with the forthcoming *Meditations* of René DESCARTES. The third and most substantial offspring was *De Cive* (Concerning the Citizen), a treatise Hobbes saw as expounding his new science of the state.

This was specifically not the mere political geography that, since Aristotle founded the subject, had passed as political science. Hobbes was, he believed, onto the real thing, a new science strictly on a par with the work of William Harvey and Galileo GALILEI. It was Galileo who "was the first that opened to us the gate of natural philosophy universal" while "the science of man's body . . . was first discovered by our countryman Dr. Harvey." However, "civil philosophy," the political equivalent of the natural philosophy which we now call physics, "is no older than my own book *De Cive*."

That putative new political science was represented, along with the best of what Hobbes had to say about everything else, in his *Leviathan*. That is, by common consent, his masterpiece. Like Descartes, Hobbes believed that the secret of success in investigations was to find out and to use the right methods. For him this was the method Galileo and Harvey learned in the University of Padua. In his preface to *De Cive* Hobbes wrote: "[E]verything is best understood by its constitutive causes. For as in a watch . . . the matter, figure and motion of the wheels cannot be well known, except when it is taken insunder [that is, apart] and viewed in parts; to make a more curious search into the rights of states and duties of subjects, it is necessary (I say, not to take them insunder, but yet that) they be so considered as if they were dissolved."

Hobbes therefore proceeded to consider what men are like and, more particularly, what they would be like if all the restraints of law and society were removed. From Galileo Hobbes had caught a vision of a universe in motion. Just as the restless atoms are the sole components of a through-and-through mechanical universe, so we ourselves are the turbulent creatures which alone compose every social machine.

To understand the nature and the function of the state we have to consider what our condition would be if there were no state; what sometimes indeed, when that machinery has collapsed, it actually is. This is the Hobbist state of nature and, Hobbes insisted, it would be "a war of every man, against every man." This often quoted purple passage ends: "And the life of man, solitary, poor, nasty, brutish and short."

Whereas for Locke the state of nature was a condition in which some of everyone's ancestors once lived, and from which they in fact escaped by making a social contract, for Hobbes the crux was not historical but hypothetical: this is what would happen if . . . and what will happen unless. . . . Security is to be achieved only by concentrating all the powers of a sovereign state into the hands of "one man or assembly of men"; though Hobbes expressed a personal preference for monarchy as opposed to any form of collective despotism.

What has been most studied and valued in Hobbes is his contribution to political thought. But he was also the

founding father of modern metaphysical materialism: "the Universe, that is the whole mass of things that are, is corporeal, that is to say body." This metaphysical commitment Hobbes pursued right through to the end. Where every contemporary was careful to provide for incorporeal physical substances, exemplified in God and the human soul, Hobbes argued with a perhaps reckless but certainly characteristic audacity that all such talk is, quite simply, incoherent and absurd. God? God is a great corporeal spirit; yes, altogether corporeal, albeit of an exceptionally refined constitution. And people? Here Hobbes takes the Aristolean and Rylean line of saying that talk about souls or minds is just a special sort of talk about the flesh and blood creatures which we are. It is no better than absurd, "when a man is dead and buried," to say that "his soul [that is, his life] can walk separated from his body, and is seen by night amongst the graves."

Descartes—that "French cavalier who set forth with so bold a stride"—saw reason to maintain only that all inanimate nature, the brutes, and the human body, are or may be regarded as machines. Hobbes has no Catholic or Cartesian inhibitions. The whole universe is mechanical; not excluding, indeed particularly including, the state and human beings.

Two sets of suggestions in Hobbes are of especial interest. First, he maintained, both in a long controversy with Bishop Bramhall and elsewhere, a compatibilist position about free will: "Liberty and necessity are consistent: as in the water, that hath not only liberty but also the necessity of descending by the channel." Second, Hobbes had a general interest in the use and abuse of language. He believed that a deal of pretentious, technical-sounding talk could be utterly discredited by trying and failing to discover its cash value in the down to earth vernacular.

Particularly in his philosophy of religion—especially in the final anti-Catholic chapters of *Leviathan*—Hobbes attacked doctrines not as unscriptural or as *merely* false but as incoherent and absurd. To Hobbes, as a staunch secularist and an anticlerical materialist, the doctrine of transubstantiation was peculiarly offensive: "[T]hey say that the figure, and colour, and taste of a piece of bread has a being there, where they say there is no bread . . . , the Egyptian conjurers, that are said to have turned their rods to serpents, and the water into blood, are thought but to have deluded the senses of the spectators by a false show of things, yet are esteemed as enchanters. But what should we have thought of them, if there had appeared in their rods nothing like a serpent, and in the water enchanted nothing like blood, nor like anything else but water, but that they had faced down the King that they were serpents that looked like rods, and that it was blood that seemed water?"

Finally, it should not be overlooked that Hobbes must have devoted much of his time between the original publication of the King James Bible in 1611 and that of his own *Leviathan* in 1651 to what is now called biblical criticism. By far his most important finding was, in his own words, that "it is said besides in many places [that the wicked] shall go into everlasting fire: and that the worm of conscience never dieth; and all this is comprehended in the word everlasting death, which is ordinarily interpreted everlasting life in torments. *And yet I can find nowhere that any man shall live in torments everlastingly*" (emphasis added).

ANTONY FLEW

HOLBACH, BARON PAUL HEINRICH DIETRICH D' (1723–1789), French author and encyclopedist. Paul-Henri Thiry was born in January 1723 in Edesheim (Rhenish Palatinate), Germany. His uncle Franciscus Adam Holbach became a wealthy man in Paris and purchased a sinecure (an office without duties) and entered the nobility, adding the prefix *d'* to his name. The elder d'Holbach brought Paul to Paris after the demise of d'Holbach's sister (Paul's mother), and had Paul educated in the classics. Paul was eventually named heir to the family title and fortune. He studied law at the University of Leiden (Netherlands), one of the finest centers of learning of the day, where he developed his taste for a free exchange of ideas and for dinner parties.

In 1749 Thiry married his second cousin. After several years, she passed away and Thiry married her sister. After the death of Franciscus, Paul (now the baron d'Holbach) inherited a vast fortune, purchased his own sinecure, and acquired a home in Paris, with whose salon his famed dinner parties would become synonymous. Grandval, his family's traditional estate, was located a few miles outside Paris, and Holbach occasionally entertained here. But his Paris home became the center of France's social, philosophical, and literary elite.

The Salon. At Leiden Holbach had enjoyed the sociability and educational rigor of university life. When he returned to Paris, he began to host dinners for a few close friends in the salon of his home. They became an institution. Every Thursday and Sunday he hosted fabulous dinners that brought together many of the day's finest minds to share food and to share, refine, and discuss ideas on all subjects. The roster of participants evolved over time, but there were a few "core" guests, including Denis DIDEROT, Friedrich Grimm, Jean-François Marmontel, Augustin Roux, and Jacques André Naigeon. Others who visited at various times included Claude HELVÉTIUS, David HUME, Jean-Jacques ROUSSEAU, Joseph PRIESTLEY, Adam Smith, Benjamin FRANKLIN, Jean d'Alembert, and Edward GIBBON. There is some debate as to whether Thursdays were reserved for the *coterie holbachique* (as Rousseau dubbed it)—the core group—and Sundays for invited guests. Scholars now believe that this was not the case, but discussion continues.

There has also been much debate as to the true nature of these dinners. Some scholars have asserted that the core group was dominated by atheists (see ATHEISM) who pressed explicitly toward atheistic, materialistic,

and rationalistic thought (see MATERIALISM, PHILOSOPHICAL; RATIONALISM). Others have argued that the salons featured a more free exchange of ideas. What is known is that clergy frequented the dinners, and attended regularly. Presumably clergy normally would not tolerate atheistic discussion for extended periods, so it must be assumed that discussion was substantially free. One of the rules of Holbach's salon was the willingness to listen respectfully to others' ideas, no matter how heretical they might become. Many salons were held in Paris during this period, but Holbach's was considered the finest, and it was considered quite an honor to attend.

Holbach's Writings. Holbach's primary interest in writing originated with his translations of German works on chemistry and mineralogy. Holbach's association with Diderot led to his writing some four hundred articles for the latter's *Encyclopédie* (see ENCYCLOPÉDIE, L' AND UNBELIEF), beginning with scientific articles on mineralogy and chemistry. Holbach also guaranteed the *Encyclopédie* financially, insuring its completion. From there, he moved toward translating philosophical works from the English, including works by John TOLAND, Anthony COLLINS, Thomas WOOLSTON, and David HUME. These works then led to the formulation and eventual publication of his own ideas.

In Holbach's day, controversial writers could seek anonymity in a number of ways. One was to write as another author, another was to publish outside of France, and yet another was to append misleading publishing information. In order to evade persecution for his writings, Holbach did all three. He had his works printed in Amsterdam by Marc-Michel Rey, with publishing information that falsely indicated they were printed in London. Books were then smuggled back into France. His anonymity was airtight enough that several regular members of his salon did not know him as their author. Naigeon knew, having transcribed the works and facilitated their printing, but others did not recognize the works as Holbach's, or chose not to point it out. There was much discussion between VOLTAIRE and Jean LeRond d'Alembert as to who the authors of these various writings might be. Voltaire had a reputation for publicly identifying the authors of anonymous works (whether correctly or not), but neither he nor anyone else was able to link Holbach directly to his writings during his life.

Holbach began writing his more controversial works against religion under the name of Nicholas Boulanger. Boulanger died in 1759, but Holbach edited a Boulanger manuscript, *L'Antiquité dévoilée par ses usages* (Antiquity Revealed) in 1766. Next Holbach wrote *Le Christianisme devoile* (Christianity Unveiled, 1767) himself but attributed it to Boulanger. Holbach then supposedly "translated" a few English works whose originals were never found. Those works are now considered original writings of Holbach.

Holbach continued to write original works attributed to others. *La Contagion sacrée* (The Holy Disease, 1768) was attributed to the Englishman John Trenchard. *Theologie portative* (Portable Theology, 1768) was attributed to Abbe Bernier. In 1770 he wrote two works without attribution to others, but also without acknowledging authorship: *Histoire critique de Jesus-Christ* (A Critical Enquiry into the History of Jesus Christ) and *Tableau des Saints* (Table of the Saints) examined the gospels critically.

Systeme de la Nature. Holbach reverted to his practice of attributing his writings to others with his most controversial work, *Systeme de la Nature* (1770). Jean-Baptiste Mirabaud was named as author of this work, which was almost as controversial as Charles DARWIN's *Origin of Species* when it appeared. The thesis of this "bible of materialism" (as it has been labeled) is that science, experience, and reason can explain all things in the universe. All things must conform to the laws of physics, and there are no supernatural causes for any phenomenon, including the existence of God. Religion is unnecessary, as human beings can exist morally with reason and experience as their sole guide. Holbach's "scientific materialism" follows his early education, his schooling, and his subsequent interests rooted in science.

This work was widely attacked; refutations were written by at least ten different authors, including even Voltaire and d'Alembert. Voltaire attacked its atheistic materialism, arguing that God was necessary as an intelligent designer. Others attacked it on ad hominem grounds, arguing that someone without belief in a deity could not be trusted. Despite the controversy and the attacks upon the work, more than eighty editions of *Systeme* have appeared in print since the 1770s.

A more concise version of *Systeme*, called *Le Bon-sens ou idees naturelles opposees aux idees surnaturelles* (Good Sense), appeared in 1772. Again, this work was unattributed; later editions (as early as 1791) were falsely attributed to Jean MESLIER. A subsequent translation from French to English by Anna Knoop changed the title to *Superstition in All Ages*, under which title it enjoyed some popularity among freethinkers (see FREETHOUGHT), further cementing the false attribution to Meslier.

Holbach's Later Life. Holbach translated Hobbes's *Human Nature*, followed by another anonymous religious work, *Recherches sur les Miracles* (Research on the Miracles, 1773). He wrote several treatises on politics, *La Politique Naturelle* (Natural Politics) and *Systeme Social* (The Social System, both 1773), and *Ethocratie* (Ethocracy, 1776), based upon ideas he first expressed in *Systeme*. His final works dealt with morals: *La Morale Universelle* (Universal Morality, 1776) and *Elements de la morale universelle* (Elements of Universal Morality, written in 1765 but published posthumously in 1790). Holbach died on January 21, 1789.

Although he didn't live to see it, some historians believe that Holbach, his salon, and his writings laid important groundwork for the French Revolution. Holbach's views struck many as extreme, but some of

them—notably the reversal of special church privileges and separation of church and state—would be achieved (if but briefly) during the revolutionary period. Holbach's ideas regarding a moral society without the need for superstition contributed greatly to the divorce of morality from religion and the idea of separation of church and state. Although he never expressly endorsed revolution, he advocated for changing the *Ancien Régime*. Holbach's ideas can still be found in later SECULAR HUMANISM, rationalism, materialism, and related movements.

TIMOTHY BINGA

HOLYOAKE, AUSTIN (1826–1874), English secularist publisher. Austin Holyoake was a quieter, younger brother of George Jacob HOLYOAKE, whose diligence and integrity were of value to the FREETHOUGHT movement.

Born in Birmingham, England, of devoutly religious parents, Holyoake became an Owenite (see OWEN, ROBERT) and freethinker as a young man. He assisted in printing the *Reasoner*, his brother's journal, having been trained in printing by his brother-in-law, J. G. Hornblower. He was active in public meetings of growing size in the north of England—though he was never really a public speaker.

In 1853 he took over James WATSON's publishing business, later transferring it to better premises in Fleet Street. This became the Fleet Street House, with a reading room, a meeting room, and a center for creating and distributing freethought literature; Holyoake became the secretary and general assistant until 1862. His own printing work continued from premises in Johnson's Court from 1864 to 1874.

He was on good terms with Charles BRADLAUGH, and for ten years printed and coedited Bradlaugh's journal, the *NATIONAL REFORMER*. In 1866 he was nominated a vice president of the NATIONAL SECULAR SOCIETY. He supported the publication of Charles KNOWLTON's birth control pamphlet *Fruits of Philosophy*, which divided the secular movement (see BESANT, ANNIE; BIRTH CONTROL AND UNBELIEF; BRADLAUGH, CHARLES; NATIONAL SECULAR SOCIETY). In addition he wrote a neo-Malthusian pamphlet of his own, *Large or Small Families* (1870).

He was a member of the Garibaldi Committee, the Association for the Repeal of Taxes on Knowledge, the Reform League, and the London Republican Club (republicans opposed continuation of Britain's hereditary monarchy). When participating in republican club meetings, he opposed the use of ostentatious flags and banners, true to his modest approach. (His wife was known as an accomplished actress.)

Two further works of his were *Would a Republican Form of Government Be Suitable to England?* (1873) and, together with Charles Albert Watts, *The Secular Manual of Songs and Ceremonies* (1871). The latter contained a burial service that was used at his own funeral in 1874. As he approached death from consumption, he wrote *Sick Room Thoughts Dictated Shortly before His Death* (1874). He was very anxious to make it widely known that the approach of death had not changed his freethought views. In a memorial article in the *National Reformer* of April 10, 1874, Bradlaugh wrote: "I have lost a friend, the movement has lost a worker."

JIM HERRICK

HOLYOAKE, GEORGE JACOB (1817–1906), English freethough advocate. George Jacob Holyoake was a leading secularist (see SECULARISM) and supporter of the cooperative movement. Although less forceful than Charles BRADLAUGH, he was a pioneer in developing secularist groups and secularist ideas.

Holyoake was born in Birmingham, the second child of a large family. His father was a whitesmith and young George was taken at the age of nine to learn the whitesmith's trade. He gradually became interested in education and participated in the Birmingham Mechanics Institute. Here he met Owenite socialists (see OWEN, ROBERT) and Unitarians (see UNITARIANISM TO 1961). In 1840 he opened the Birmingham District Rational Schools and was elected president of the Birmingham Owenite Branch.

He was invited to lecture at Worcester and gained a post there. His first lecture, "An Enquiry into the Incentives Offered by Present Society in the Practice of Honour, Honesty, and Virtue," suggests a worthy rather than exciting style. He was not a powerful public speaker, and his high-pitched voice and dry material

tempered his success as an orator throughout his life.

Holyoake moved to Sheffield, then visited Bristol in 1840, where he met Charles SOUTHWELL, who had been prosecuted for BLASPHEMY for a scurrilous description of the Bible in the *Oracle of Reason*. Holyoake was falling out with the Owenites over their unsuccessful attempts to create utopian communities. Swayed by Southwell toward a firmer ATHEISM, he took over editing the *Oracle of Reason* while Southwell was in prison.

In 1842 Holyoake walked from Sheffield to Bristol, and paused to lecture in Cheltenham en route. His subject was "Home Colonisation as a Means of Superseding Poor Laws and Emigration." This would not have caused controversy had he not been asked by a clergyman at the end what place there would be for God in his new community. He replied: "If I could have my way I would place the Deity on half-pay as the government did the subaltern officers." It was an untypical moment of defiance.

He was imprisoned for blasphemous libel in Gloucester Gaol. After protest that he was not given due legal procedure he was released until the trial, where he spoke for nearly eleven hours in his defense. This did not impress the jurors sufficiently to deem him not guilty, and he was given a six-month sentence. Prison conditions were hard, but he was sufficiently industrious to write two thousand letters and a few pamphlets. He was always bitter that poverty led to hardship for his family and death for his daughter. After release, he was in demand lecturing as the "Liberated Blasphemer." He traded on his martyrdom for the remainder of his life, without doing much more to justify the reputation.

After his release he founded a journal, the *Movement*, whose aim was to "maximise morals, minimise religion." He continued lecturing at the Glasgow Rational Society and at the Blackfriars Rotunda in London. Under the influence of the printer James WATSON, he then founded the *Reasoner*, which proposed to be "Communistic in Social Economy—Utilitarian in Morals—Republican in Politics—and Anti-Theological in Religion."

Secularism. After the failure in 1848 of the Chartists, who advocated political reforms friendly to the working class, radicals were depressed and in disarray. Holyoake founded the Society of Theological Utilitarians to oppose "the vast organized error of religion." In 1851 in London he gave a lecture at the London Hall of Science leading to the foundation of the Society of Reasoners, which shortly changed its name to the London Secular Society. Holyoake had developed the word *secularism* to create a more positive label for antireligious thought and activity. Influenced by Auguste COMTE, he liked to quote the latter's dictum that "[n]othing is destroyed until it is replaced."

Holyoake wanted to create a federation of secular groups around the country, but was not confident of success. By 1854 the London Secular Society became a leading group (there were also strong groups in the north of England). He became president of the federation in 1854. Secularism as developed at this time was influenced by Owenism and Chartism, and the movement flourished as a series of social groups. But Holyoake's leadership was weak, and it was not until Bradlaugh took over that a forceful movement developed.

The *Reasoner* was tame and pedagogic, but nevertheless Holyoake's pen was more effective than his voice. Like many FREETHOUGHT journals, it struggled to remain solvent and died in 1861, by which time the *NATIONAL REFORMER* had taken over. Holyoake was active in the movement to abolish the so-called taxes on knowledge, which acted as a brake on the publication of journals. Another campaign he espoused was national secular education. Holyoake thought that by this time, substantial social change had occurred: there was an improvement in the tone of controversy, the BLASPHEMY laws were discredited, and belief in sin, eternal punishment, and the infallibility of the Bible had declined.

When Bradlaugh took over the Secularist movement, Holyoake retained some respect but little influence. He irritated Bradlaugh by opposing the latter's struggle to take his Parliamentary oath. His opposition to Bradlaugh in the trial of the birth control pamphlet the *Fruits of Philosophy* (see BIRTH CONTROL AND UNBELIEF; BESANT, ANNIE) led him to join an alternative group, the British Secular Union. He still argued for abolition of church taxes, blasphemy law, and Christian oaths in courts. Criticism of the Crimean War and support of European revolutionaries such as Giuseppe Mazzini were part of his agenda. He became venerable but not influential. His books tended toward self-justification, but are of historical interest.

Holyoake's later life was particularly taken up with a defense of the cooperative movement. He wrote the *History of Co-operation* (1858) in Rochdale, and later became the historian of the movement. His monument was perhaps Holyoake House in Manchester, the headquarters of the cooperative movement.

Writing and publishing were important during the latter thirty years of his life. He had established Fleet House with his brother Austin HOLYOAKE as a freethought publishing center. Among his works his autobiography, *Sixty Years of an Agitator's Life* (1893), is important but inaccurate, unduly emphasizing the many important people he had known. *Bygones Worth Remembering* (1905) has a title that might be doubted by some. One of his best volumes, because it has within it the pulse of events, is *The Last Trial for Atheism in England: A Fragment of Autobiography* (1871). His interest in publishing is reflected in his becoming the first chairman of the RATIONALIST PRESS ASSOCIATION.

Holyoake was a significant campaigner and writer, hovering between activism and moderation, respected but not revered, keen to lead the working-class movement from which he originated but ever eager to be recognized by the higher classes with which he came in touch.

JIM HERRICK

HOOK, SIDNEY (1902–1989), American political philosopher and educator. Sidney Hook was a proponent of pragmatic NATURALISM (see also PRAGMATISM). A trenchant critic of totalitarianism, Hook defended democracy, the use of scientific methods, naturalistic ethics (see ETHICS AND UNBELIEF), and SECULAR HUMANISM. Hook was considered the leading advocate of the philosophy of John DEWEY. He held that philosophers should be concerned with the large problems of human affairs and should have something to say to their fellow citizens and not only to other philosophers.

Hook was born on December 20, 1902, in New York City. He studied under Morris R Cohen at City College of New York, where he took a BS in 1923, and under John Dewey at Columbia University (MA, 1926; PhD, 1927). He joined the faculty of New York University (1927–67), where he became chair of the philosophy department. Hook also taught at the New School for Social Research (from 1931), Harvard University (1961), the University of California at Santa Barbara (1966), and the University of California at San Diego (1975). He helped initiate many organizations, including the American Committee for Cultural Freedom, the Conference on Methods in Science and Philosophy, and the New York University Institute of Philosophy, and was a cofounder of University Centers for Rational Alternatives. He served on the National Endowment for the Humanities Council (1972–78) and was vice president of the League for Industrial Democracy. Hook was elected president of the Eastern Division of the American Philosophical Association (1959–60) and was president of the John Dewey Foundation and a Humanist Laureate of the International Academy of Humanism (1983). In the later part of his life, he was senior research fellow at the Hoover Institution at Stanford University. His awards included Guggenheim and Ford Foundation fellowships, a Nicholas Murray Butler Medal from Columbia University, and a Presidential Medal of Freedom (1985). Hook was also a fellow of the American Academy of Arts and Sciences. He died in Stanford, California, on July 12, 1989.

Hook's main interests were normative. As a "Socratic gadfly" his focus invariably was on concrete ethical, social, and political issues. He was considered an outstanding polemicist, debating many of the leading thinkers of his day, including Bertrand RUSSELL, Max Eastman, Mortimer Adler, Jacques Maritain, Noam Chomsky, Albert Einstein, and Paul Tillich (see RELIGIOUS HUMANISM).

The young Hook was one of the first avowed Marxists on an American university faculty. In *Towards the Understanding of Karl Marx* (1933) and *From Hegel to Marx* (1936), he interpreted Marx in pragmatic terms, testing theoretical ideas by their consequences in praxis (see MARX, KARL; MARXISM). Later, disenchanted with Marxism-Leninism, he became one of the leading critics of communism. Although he was a critic of Leon Trotsky, Hook organized, along with John Dewey, an inquiry into Stalinist charges against Trotsky that was held in 1938 in Mexico City. (Though critical of Trotsky's ideology, the commission exonerated him of the charges.) Hook considered himself a democratic socialist (or social democrat), maintaining that the central issue of our time was not socialism versus capitalism but totalitarianism versus democracy. This conviction he spelled out in *Reason, Social Myths, and Democracy* (1940) and *The Hero in History* (1943).

Hook sought to justify democracy empirically by whether it led to a higher standard of living, lessened duplicity and cruelty, and enlarged the dimensions of human freedom, creativity, and growth. As a system of government, democracy was based on the freely given consent of the majority. It respected the rule of law, the legal right of opposition, and civil liberties. But it was grounded on the ethical principles of freedom and equality: individuals should be afforded the freedom and opportunity to realize their unique talents and needs and, where necessary and possible, be provided with the economic and cultural means to satisfy them.

Some critics have found a disparity between the early Hook, who was a revolutionary Marxist, and the later Hook, who emphasized democratic social change. He denied that he had ever become a "neoconservative." Philosopher Lewis S. Feuer considered him to be the political thinker of the twentieth century most responsive to the events of the day.

Hook was committed to a naturalistic value theory: ethical judgments should be tested by rational inquiry into the facts of the case and be evaluated according to the consequences of alternative courses of action in the actual "natural" world.

Hook defended some form of naturalistic ethics. It is here that Hook has made his major contribution, for

unlike many of his fellow philosophers, who withdrew into the sanctuary of metaethics, he descended to the world of concrete moral and social problems and attempted to apply pragmatic intelligence to their solution. In this area he displayed a unique virtuosity in his moral perceptions and deliberations.

Hook held that the subject matter of ethics was autonomous, not deducible from prior metaphysical or theological premises, and that it is possible to use critical thinking to modify our values in the light of evidence.

The question often is raised, Where does the ethical naturalist begin? Are there first principles that govern human moral behavior? Hook expressed some skepticism. On his view, we cannot find first principles from which we can deduce moral imperatives. Rather, we must begin in the midst of life, embroiled in problematic situations that need resolution, and we make moral choices by appealing to various principles and norms that we accept; but we may evaluate and modify them if need be in the light of their factual and consequential effects. Hook applied the empirical method of pragmatic intelligence to a wide range of topics: euthanasia, academic freedom, affirmative action, the ethics of scientific research, the curriculum in the schools, US foreign policy, and so on.

Like Dewey, Hook was a strong defender of the public schools. In *Education for Modern Man* (1963), he maintained that the key role for education in a democratic society was to develop an appreciation for critical intelligence. He sought to defend the universities as institutions devoted to research and teaching, and he criticized efforts to politicize them or to replace the study of great ideas in history with a multicultural curriculum.

Hook took issue with both absolutist theological dogma and postmodern subjectivism. He did not think that there was sufficient evidence to prove the existence of God or personal immortality (*The Quest for Being*, 1961). Neither, he thought, could noncontradictory ethical principles be derived from theological premises.

Hook stands out as one of the leading philosophical defenders of secular humanism in the twentieth century against its neoconservative, orthodox, and fundamentalist critics.

Throughout his career, Hook considered himself a naturalistic humanist. He began to use the term *secular humanist* especially in the last decade of his life (he was a charter founder of *Free Inquiry* magazine and a signer of the Secular Humanist Declaration of 1980), no doubt in response to the many attacks that secular humanists had suffered at the hands of the US Religious Right.

The terms *secular humanism* and *naturalistic humanism* overlap and share a common agenda. They differ only in regard to focus and emphasis. *Secular humanism* came into vogue to differentiate it from *religious humanism*, a term bandied about by many dedicated humanists. In *A Common Faith*, John Dewey was willing to use the term *religious* to denote our commitment to ideal ends that move us. Indeed, Dewey, who was a nontheist, even used the term *God* in a metaphorical sense to refer to the "unification of our values."

Sidney Hook was critical of John Dewey's use of *religious*, which he thought was ambiguous and confusing. Thus the term secular was applied to HUMANISM to differentiate it from fuzzy-minded religious humanism.

The term *SECULARISM* thus gained popular recognition in American life, but only because of the need within the US political scene to defend it. The term *naturalism* is, however, the basic philosophical concept that underlies contemporary humanism.

The first premise of Hook's naturalism is methodological, for he considered the methods of science to be the most effective way of understanding nature and solving human problems. He interpreted the methods of science broadly as "the method of intelligence." This presupposes that science is continuous with common sense; and it endeavors to test ideas, hypotheses, and theories by their experimental consequences. Hook maintains in his essay "Naturalism and First Principles" that "there are working truths on the level of practical living . . . viz., the effective use of means to achieve ends."

Hook likewise defended a second form of naturalism, which may be called scientific naturalism. This is an endeavor to develop a generalized account of experience in nature as humans transact in the world; it draws its knowledge primarily from the various sciences, not from religion, tradition, or the arts. It also defends, at root, the primacy of "matter" rather than "spirit." But Hook's materialism was nonreductive. He defended a form of emergent evolution, because he held that each kind of phenomenon encountered should be described and accounted for on its own level and in its own terms. This was consonant with his earlier defense of Marxist dialectics, which dealt with social and cultural phenomena without attempting to reduce them to physics or chemistry.

What is crucial for Hook is that naturalism reject supernatural claims because they do not meet the test of public VERIFIABILITY. Hook did not think that there was sufficient evidence or reasons that would demonstrate the existence of God, let alone enable us to define it. There are many conceptions of God and the soul, Hook maintained, that are so unintelligible and vague that nothing significant can be said of them. Concepts such as God have no empirically discernible effects, and no publicly observable evidence that can be brought to support the claim that God exists. Hook questions the cognitive legitimacy of purely speculative metaphysics or ontology. The quest for being as such, "as an all-inclusive category," is not meaningful "for it does not seem to possess an intelligible opposite."

Hook was skeptical of classical Thomistic arguments for the existence of God (see EXISTENCE OF GOD, ARGUMENTS FOR AND AGAINST). He likewise questioned the famous queries posed by Heidegger, "Why is there something; why is there not nothing?" And he claimed that

these are devoid of sense except as a "sign of emotional anxiety." Similarly for Paul Tillich's "shock of non-being or being not," which refers to unfulfilled or disappointed expectations, a "purely psychological category." Neither of the above have any ontological status. Hook's analysis is in accord with Immanuel KANT's critique of rational theology, for in talking about "Being as such" we are not referring to a predicate, attribute, or property. "There is no absurdity," paraphrasing Morris R. Cohen, "to which a philosopher will not resort to defend another absurdity!"

Although Hook articulated a nonreductive naturalism, he left a significant place for various aspects of human experience, including the arts, morality, and cultural creativity.

Expressing confidence in the ability of humans to solve their problems by means of intelligence and courage, Hook had little use for the "irremedial tragic dimensions" of human existence, the nihilistic desire to withdraw from the universe, or the illusory promises of utopian salvation in this world or the next (*Pragmatism and the Tragic Sense of Life*, 1974). In his last work, *Convictions* (1990), published posthumously, he defended the right to a dignified death, suicide, and voluntary euthanasia.

Hook identified with humanism as an ethical doctrine. "An ethical humanist," he affirmed, "is one who relies on the arts of intelligence to defend, enlarge, and enhance the areas of human freedom in the world" (*The Humanist Alternative*, edited by Paul Kurtz, 1973). *Out of Step: An Unquiet Life in the 20th Century* (1987), Hook's autobiography, presents a graphic memoir of his lifelong commitment to political freedom and social justice.

PAUL KURTZ

HOOPS, WALTER (1902–1999), German American freethought activist. Walter Hoops was born to a working-class family in Hanover, Germany, on April 2, 1902. His father was a mail carrier and a Social Democrat. He was not particularly politically active; young Walter was more influenced by an uncle who belonged to a union (see SOCIALISM AND UNBELIEF). German education was very good, and Walter was always interested in books and reading. At the age of sixteen he was sent to a farm near the Dutch border and received compulsory military training. He returned to school after World War I was over. He was able to attend the university as a "working student" but had to return home after a year to help his family.

Walter's older brother was killed in the war. His mother became angry with God for letting this happen, and the family never again attended church.

In 1922, after Nazis assassinated Walter Rathenau, a political leader Hoops much admired, he was enraged and went to Socialist headquarters to volunteer his services. Placed in charge of the youth movement, he developed sixteen groups in Hanover. When his company, which sold school and architectural supplies, transferred him to Frankfurt he continued this work.

The Socialist movement was an excellent resource for recruiting members for the *Freidenker* (freethinker) movement (see GERMANY, UNBELIEF IN). Germans were automatically enrolled in a church and had to pay a church tax unless they went before a judge and requested to leave. Hoops arranged for an attorney able to take such statements present at *Freidenker* meetings so recruited members could leave the church on the spot. Part of the success of the *Freidenkers* was due to the fact that they offered a free funeral, providing a horse and wagon and an orator to anyone who was a member for five years. This was an excellent recruiting tool, and the dues of these members (whether they attended meetings or not) provided financing for a magazine and other needs. The membership rose to eight hundred thousand, of which seven hundred thousand were "crematory" members.

Hoops's company transferred him to Vienna and then

to New York City in 1924. There he joined in Socialist protests and worked with Sidney HOOK. He likened Union Square to Hyde Park and recalls forming a cordon around Margaret SANGER to protect her from harassment. The new "talking" motion pictures helped him improve his English.

He sent for his sweetheart from Germany; they were married and they traveled together through much of the United States in connection with his work. They came to St. Louis in 1931.

With the rise of Adolf Hitler in Germany, the company employing Hoops folded. His wife got work as a modern dance instructor, and Hoops found whatever work he could, including driving a truck for a dry cleaner. The couple stayed in St. Louis, where they had one daughter.

After World War II Hoops worked with a Jewish committee helping Jews come into the United States. Each Jew seeking to immigrate had to have an affidavit; Hoops later recalled signing ninety-nine in one day. He also gathered donations of clothing and supplies to send to people in Germany who had lost their possessions in the war. He recalled that during a visit to Germany in 1991, people still thanked him for sending the packages.

In St. Louis, Hoops was a member of the FREIE GEMEINDEN (a German freethought group) and also of the Ethical Society (see ETHICAL CULTURE). He was one of the founding members of the Rationalist Society of St. Louis, of which he said, "They talk a lot, but they don't do much." He often gave talks on topics such as the French Revolution and Denis DIDEROT.

When the *AMERICAN RATIONALIST*, a freethought periodical, began publishing book reviews, subscribers asked for an easy way to purchase the books under review. Hoops started St. Clair Book Service, a direct-mail bookselling service he ran from his home. It carried each title reviewed in *American Rationalist* and many titles and pamphlets published by the Rationalist Association. He also offered Emanuel HALDEMAN-JULIUS's Little Blue Books. After Haldeman-Julius's death, his son contacted Hoops and sold him the books by the pound. The book service brought in thousands of dollars for *American Rationalist*.

Hoops died in 1999, a venerated figure in the rationalist and freethought movement. He maintained his socialist and freethought convictions all his life and will be remembered for his contributions.

BARB STOCKER

HORN, KRISTIAN (1903–1981), Norwegian freethinker and humanist activist. Kristian Horn was in 1956 the main founder of Human-Etisk Forbund (Human-Ethical Society), the largest Norwegian organization of churchless persons (see NORWAY, UNBELIEF IN). Horn was also the society's first national leader from 1956 until 1976, when Levi Fragell succeeded him. Horn studied chemistry, botany, zoology, geology, and paleontology at the University of Oslo where he earned a master of science degree. Later, between 1947 and 1970, he was research assistant at the botanical laboratory of the University of Oslo. For many years Horn, who also studied philosophy, FREETHOUGHT, and the history of religions, was the main ideologist of Human-Etisk Forbund.

Horn's ideology has four main elements: (1) RATIONALISM, which for Horn primarily meant a positive attitude toward reason. (2) AGNOSTICISM, which for Horn meant the will to stick to what is known and not to go beyond it. In his agnosticism Horn emphasized what he called the "experience of honesty," that is, one should be honest and not maintain more than the evidence allows one to do. And he maintained that humans do not know anything about God, gods, or other so-called supernatural forces. (3) A third major element in Horn's SECULARISM was his view that ethics does not have its basis in any religion, but rather in human life and experience. (4) A fourth and final element of Horn's ideology was a strong emphasis on the Golden Rule as the main ethical rule to which he appealed. The Golden Rule has two versions, a positive one, "Do to others what you want them to do to yourself," and a negative one, "Do not do to others what you do not want them to do to yourself."

Under the leadership of Horn and afterward, Human-Etisk Forbund strongly promoted the practice of secular ceremonies at various stages of life (see RITUAL, CEREMONIAL, AND UNBELIEF). At first secular confirmations (coming-of-age ceremonies) were stressed as alternatives to traditional religious confirmations of youngsters aged about sixteen. Over the years secular confirmations have become very common. Secular funeral ceremonies followed, then secular name-giving ceremonies for infants, and, still later, secular marriage ceremonies.

For many years Horn was active in the area of secular ceremonies. He gave talks in various groups and wrote on the ideology of Human-Etisk Forbund. In his work he was primarily supported by his wife, Ester Horn, and a handful of other collaborators.

FINNGEIR HIORTH

HUBBARD, ELBERT (1856–1915), American writer and promoter. Elbert Hubbard was world renowned as a writer and homespun philosopher because of works like his most famous essay, "A Message to Garcia," and because of his flamboyant self-promotion. He founded an important

organization of arts, crafts, printing, and publishing known as the Roycrofters, and helped to defend, publish, and promote the agnostic orator Robert Green INGERSOLL. Hubbard's timing was often lucky—he wrote and published "Message to Garcia," an essay he dashed off in an hour, in 1899. This moralistic homily about a soldier dutifully and resourcefully getting a message from President William McKinley through to a Cuban rebel leader appealed to residual patriotism from the 1898 Spanish-American War. It also won almost immediate approval of captains of industry and military leaders around the world, which generated eventually as many as forty-three million reprints—and quickly made Hubbard famous. Hubbard published a biographical piece on Ingersoll—an idiosyncratic appreciation that included pages of Ingersoll quotations skewering Christianity and fundamentalism—soon after Ingersoll's death in 1899. Hubbard's essay extolled and defended the Great Agnostic at a time when many were eager to bury Ingersoll's effective critique of religion along with the man. Hubbard also published some of Ingersoll's lectures as pamphlets. This promotion of Ingersoll came just as Hubbard's own fame and fortune were growing rapidly and helped keep Ingersoll world famous.

Hubbard was a contradictory figure. Sometimes conservative and moralistic, sometimes radical and egalitarian, a critic of orthodoxy and fundamentalism but a defender of spirituality, Hubbard built a career and fortune on selling. He first sold soap, then became chief marketer for the Larkin Soap Company of Buffalo, New York, where he introduced the idea of including premiums, such as dishes, for buyers. Tired of that success, Hubbard sold his interests and established the Roycrofters in East Aurora, New York. He gained fame both by writing sometimes sentimental, sometimes "spiritual," aphorisms and by publishing collections of others' wisdom.

With his second wife Hubbard sailed for Europe, reportedly traveling in hopes of visiting with Kaiser Wilhelm and urging him to end World War I. The couple died when the Germans sank the *Lusitania* in 1915.

HUGHES, LANGSTON (1902–1967), American poet, author, and humanist (see HUMANISM). Born in Joplin, Missouri, on February 1, 1902, Langston Hughes was one of the twentieth century's most prolific and widely admired poets, regarded as black America's poet laureate. But poetry was not his only talent. He was also a playwright, a writer of short stories, a novelist, and an essayist. Following in the footsteps of the African American poet Paul Laurence Dunbar, Hughes became only the second African American to make his living as a writer.

Hughes's great-grandfather was a white planter from Virginia who risked alienation from his family by falling in love and living with a black woman and their children. Three of their sons actively opposed slavery and racial segregation, one becoming a United States congressman and US representative in Haiti.

Another son—Hughes's grandfather, Lewis Sheridan Leary—fought alongside John Brown in his famous raid on Harpers Ferry. The following day he was shot, and he died two days later. Leary's widow, Mary—Langston's grandmother—received the shawl in which he died. She read to young Langston during his young boyhood, telling him stories of heroic black men and women who worked hard to uplift their people. She and her abolitionist husband had worked on the Underground Railroad, and she imparted their values to young Langston, who slept under the shawl in which his grandfather had died. Mary Leary would later marry Charles Howard Langston, another Virginia planter and defender of human rights.

Hughes lived in various places and with different guardians during his childhood: with his mother, Carrie; his grandmother; and his father, Jim. In the middle of April 1909 he left his mother and returned to live with his grandmother in Lawrence, Kansas. On August 31, 1910, he observed the dedication of the John Brown Memorial Battlefield in Osawatomie, Kansas. His grandmother occupied a special seat on the platform; former US president Theodore Roosevelt delivered a stirring speech.

Eventually, Hughes moved to Cleveland, Ohio, graduating from Central High School in 1920. In 1921 the *Crisis*, the magazine of the National Association for the Advancement of Colored People (NAACP), published his poem "The Negro Speaks of Rivers." In 1922 he briefly attended Columbia University, intending to earn an engineering degree to fulfill his father's wishes. However, he dropped out to travel and pursue his writing career.

In 1925 he won the first prize in poetry from *Opportunity* magazine. In 1926 he published his first volume of poetry, *The Weary Blues*. By 1929 he had earned a degree from the historically black Lincoln University. In 1930 he published his first novel, *Not without Laughter*.

For a brief time, Hughes worked in the office of leading black historian Carter G. Woodson, hailed in his day as the "Father of Negro History." Woodson was responsible for establishing Negro History Week in 1926. The celebration has since expanded into today's Black History Month.

Hughes wrote a regular column for the *Chicago Defender*, one of black America's leading newspapers. In 1930 he went on a tour throughout the South and wrote about the Scottsboro Boys in Alabama—a sensational case in which black men were accused of raping a white woman.

In his autobiography, *The Big Sea*, Hughes included a section titled "Salvation," in which he discussed a negative religious experience he had as an adolescent. Attending a revival at his aunt's church, he had asked Jesus to come into his life; when nothing happened, he was disillusioned. He then rejected theism and embraced a secular worldview (see ATHEISM; SECULARISM).

Later in life, Hughes would embrace Marxist/Leninist thought (see MARXISM; MARX, KARL; LENIN, VLADIMIR ILYICH). He wrote two poems widely considered blasphemous, "Christ in Alabama" and "Goodbye Christ." Many Christians were outraged.

In a letter to secular humanist Warren Allen Smith, Hughes said that he rejected theism, but did not particularly care for the term *humanist*.

Though he rejected theism, he continued to be attracted to black spirituality and black religious music. Near the end of his life, when his health began to fail him, he seemed to become increasingly religious.

Hughes's literary accomplishments were remarkable, some influential writings being published only after his death. His poems have influenced some of the most influential African Americans in history, including Martin Luther King Jr. On February 1, 1991, Maya Angelou, Amiri Baraka, and other famous writers gathered at the Schomburg Center for Research in Black Culture in Harlem to inter his cremated remains in the "I've Known Rivers" tile floor.

NORM R. ALLEN JR.

HUMANISM. Humanism has had a long and significant history. Over some twenty-five hundred years it has acquired a number of different meanings. In Western thought, the concept of humanism can be traced back to the Greeks, who, in their efforts to develop a theoretical philosophical and scientific outlook on nature, placed foremost emphasis on human rationality, believing that the good life could be achieved by human power and the fulfillment of human nature.

The Anicent World. One of the early advocates of this view was PROTAGORAS in the fifth century BCE, who stated that "man is the measure of all things." For him each person must be his or her own authority. Protagoras was also one of the first Sophists, a term applied to itinerant teachers in Athens and elsewhere in Greece who gave instruction for a fee regarding how to cope with (or get ahead in) the world. The Sophists attacked conventional morality and sought to establish an ethic of REASON. Being a Sophist could be dangerous; Protagoras was impeached for not respecting the gods and was either banished from Athens or had his books burned, depending on which source one consults. The most famous Sophist, SOCRATES, was forced to commit suicide. Yet both thinkers achieved cultural immortality. In the fourth century BCE, ARISTOTLE expanded on this new humanism in his *Nichomachean Ethics*, which served as a model for a humanistic life devoted to practical wisdom and the fulfillment of virtue and excellence.

These concepts were picked up in the expanding Roman Empire, where they would inspire the formation of widely varied schools of thought. Epicurism as developed by EPICURUS held that sense perception was the one and only way to knowledge. The most complete rendition of this concept is given by LUCRETIUS. In his *De Rerum Natura* (On the Nature of Things), he held both that the world was governed by mechanical laws that could be known, and that the soul died with the body. A different interpretation was advanced by STOICISM, in its Roman form an ethical system holding that virtue was based on knowledge. Seneca, Epictetus, and the emperor Marcus Aurelius carried this message to the Roman world. A third school, the Skeptics, developed through the writings of Sextus EMPIRICUS and others, insisted on the need to suspend final judgment about dogmatic theory and knowledge (see SKEPTICISM). Probably the most important transmitter of these ideas into the post-Roman world was CICERO, whose highly eclectic works explained and borrowed from all who had gone before.

Humanism in Medieval and Early Modern Europe. As Rome's influence over western Europe declined, the class of educated laymen like Cicero disappeared. Education was slow to revive and usually centered in monastic and cathedral schools, which initially emphasized theology. As the dislocations attendant on the destruction of the western Roman Empire subsided, the schools' curricula gradually expanded. By the twelfth century, the first universities had appeared.

Christian theology, based mainly on the works of Saint Augustine, was now challenged by the rediscovery of Aristotle. The twofold result was that Aristotle was Christianized through the works of Thomas Aquinas and others, while Christianity became more Aristotelian in a movement known as Scholasticism. At first it was a selective Aristotelianism; but Aristotle's more humanistic works, too, eventually appeared in Latin. There was also a deliberate search for other classical manuscripts and a corresponding effort to disseminate the thinking expressed in them.

Cicero had been known previously, but he became an exemplar for the new humanism of the fourteenth and fifteenth centuries. Thinkers beginning with Petrarch sought to revive classical writing and concepts as a cultural model. In this context, humanism emphasized what we now call the humanities, but also included elements of the earlier humanism, including a sort of skepticism that promoted a willingness to challenge church doctrine. Nicholas of Cusa, for example, demonstrated that the so-called Donation of Constantine was an eighth-century forgery, not written in the fourth century as claimed. The popes had used this forged document to claim authority over all the churches in the West and to claim primacy for Rome over the other patriarchal centers at Antioch, Alexandria, Constantinople, and Jerusalem. If the Donation was a forgery, other church doctrines too could be challenged; there followed a widespread effort to bring the classical manuscripts preserved and copied in the monasteries to a wider readership.

Most important in spreading humanistic ideas was the development of printing in the fifteenth century. Pamphlets and books reached ever-larger audiences. Humanism began to outgrow its focus on reviving classical literature, emphasizing also classical views of the place of human beings in the universe. Philosophical humanists including Gianozzo Manetti, Marsiglio Ficino, and Giovanni Pico della Mirandola emphasized the dignity of humans, their capacity for freedom, and the need for tolerance. Desiderius ERASMUS, writing as struggle raged between Catholicism and the developing Protestant movement, is noteworthy for his defense of religious toleration.

As this new marketplace for ideas widened, some humanists and scientists grew more keen to challenge ecclesiastical and political censorship. Giordano BRUNO challenged the teachings of the Catholic church with caustic satire, for which he was burned at the stake. Galileo GALILEI enjoyed greater influence with the papal establishment and so escaped the stake, but was forced to recant and forbidden to teach. Despite his recantation, his books continued to be published, marking the beginning of modern science. Galileo's observation that the earth moved around the sun changed the whole nature of science and its view of the universe, which came to be seen as heliocentric rather than geocentric. What Galileo did for views of the solar system, William Harvey did for understanding of the human body, both challenging traditional and long accepted concepts.

If such a radical change could take place in cosmic outlook, traditional ideas in other areas could be challenged as well. Individuals such as Michel MONTAIGNE felt free to express both skeptical and humanist values, while Baruch SPINOZA went so far as to defend what we would now recognize as FREETHOUGHT. He rejected biblical revelation as a source of ethics and paved the way for a new science of nature. The growing tendency to naturalize religion by identifying God with nature and reason underlay the writings of VOLTAIRE and Denis DIDEROT.

Confidence grew that through reason, science, and education, human beings could be liberated from superstition. New universities appeared, and new thinking diffused to places previously not known as centers of learning. The Enlightenment philosophers of the eighteenth century, such as René DESCARTES, Sir Francis Bacon, John LOCKE, and David HUME, turned to reason, experience, or both, rather than to religious authority, to account for natural causes and to discover causal laws (see ENLIGHTENMENT, UNBELIEF DURING THE). All these thinkers were humanists in that they emphasized the ability of humans to deal with the world's problems.

The utilitarians Jeremy BENTHAM, James Mill, and his son John Stuart MILL took up the cudgels in the early nineteenth century, defending freedom of thought against political and ecclesiastical repression. They insisted on tolerance of opposing viewpoints and championed the idea of freedom of conscience. By the end of the nineteenth century, increasing numbers viewed neither religious revelation nor long-held traditional belief as an authoritative source of knowledge. A few went so far as to deny that either was a source of reliable knowledge at all.

Humanism as an Alternative to Religion. The beginnings of organized humanism as an explicitly nontheistic alternative to religion can also be traced to the nineteenth century. Auguste COMTE described three ages of religion in humans. The first, he said, was the *theological*, in which humans ascribed to the supernatural whatever they did not understand. This was succeeded by the *metaphysical*, in which ideas were thought to be the key to natural phenomena; and finally by the *positive*, in which phenomena were understood using the scientific method. Positive clubs were formed in Europe and in the Americas with the goal of launching this third stage of religion. There was even a Church of POSITIVISM established in Brazil in 1881.

Humanistic organizations began to form more rapidly. Though conceived more or less explicitly as alternatives to traditional religion, most patterned themselves after the congregational life of the churches. A group calling itself the Humanistic Religious Association was formed in London in 1853. Its members proclaimed themselves free from the compulsory dogmas, myths, and cere-

monies of the ancient past. They met regularly for cultural and social meetings, provided education for their children, and furnished assistance to members in need. In Germany, a new liberal Christian denomination, the Bund Friereligose Gemeinden Deutschlands (German Federation of Free Religious Congregations), was established in 1859. In the United States dissenters from creedalism within the Unitarian Church (see UNITARIANISM TO 1961) founded the Free Religious Association under the leadership of Ralph Waldo EMERSON. A similar movement occured in American Judaism with the formation of ETHICAL CULTURE in 1876. It focused on social service and concentrated on issues of life in this world. The ideas of Ethical Culture founder Felix ADLER were picked up by others in Chicago, Philadelphia, and St. Louis. Moncure CONWAY, an American minister at a Unitarian chapel in London, began guiding his congregation in a specifically ethical nontheistic direction; his church became the SOUTH PLACE ETHICAL SOCIETY.

Other initiatives were less closely modeled on the churches. Avowed atheist Charles BRADLAUGH brought together other English freethinkers to form the NATIONAL SECULAR SOCIETY, an activist organization, in 1866. In the United States a growing freethought movement was energized by the oratorical powers of the agnostic Robert Green INGERSOLL, the most popular—and controversial—public speaker in nineteenth-century America.

Though only one of these movements employed the term *humanism*, all were nontheistic, and forerunners of what in the twentieth century would become organized humanism.

Supportive Social Trends. Though churches remained powerful, their grasp on what people could or could not do was being challenged by the rise of SECULARISM: the conviction that conduct and action should be judged by worldly and temporal standards, rather than spiritual and sacred ones. Morality could be freed from religious authority. Once that occurred, the secular values and ideals of reason, freedom, happiness, and justice could be substitued for the Christian virtues of faith, hope, and charity—and the exaggerated sense of sin inherent in the faith. This engendered a challenge to ecclesiastical control over various institutions of society from marriage and divorce (see SEX RADICALISM AND UNBELIEF) to birth control (see BIRTH CONTROL AND UNBELIEF), Sunday closing laws, and other economic and educational issues.

This humanistic and secularizing impulse was enshrined in the US Constitution with its separation of church and state. Thomas PAINE, Benjamin FRANKLIN, and James MADISON, among other founders, were strongly influenced by the humanist and secular values of the Enlightenment. Many figures of the nineteenth and twentieth centuries reflect a humanistic heritage, among them Karl MARX, Sigmund FREUD, Bertrand RUSSELL, John DEWEY, and many others included in this volume. Movements such as MARXISM, EXISTENTIALISM, PRAGMATISM, NATURALISM, Positivism, behaviorism, libertarianism, social construction, and many others have claimed humanist credentials.

Indeed, so influential did humanism become that some religious leaders have felt it important to proclaim themselves humanists. Pope John Paul II called himself a humanist; the Roman Catholic philosopher Jacques Maritain claimed that Christian humanism is the only authentic humanism. Maritain saw Christianity as concerned with ameliorating the human condition on earth, one of the major goals of humanism as well.

Secular and Religious Humanism. Certainly, the modern movements of SECULAR HUMANISM and RELIGIOUS HUMANISM have shared roots in Christianity and Judaism. A large number of self-identifying humanists refer to themselves as religious. In the United States many members of the Unitarian Universalist Church, as well as other churches, identify themselves as religious humanists (see UNITARIAN UNIVERSALISM). To be sure, in the first part of the twentieth century the American humanist movement was dominated by those who viewed humanism as their religion. Many such humanists observed a distinction between a "religion" and "the religious"; they rejected theism but emphasized the spiritual qualities of experience. Some were willing even to consider such ideas as God, though only if they define the terms. John Dewey considered the term *God* to signify the highest human ideals, sounding very much like the Christian theologian Paul Tillich, who defined God as the "ultimate concern." Such interpretations give a nontheistic meaning even to the term *God*.

Only in the mid-twentieth century did organizations develop that explicitly called themselves humanist (the mid-nineteenth-century Humanistic Religious Association having disappeared long before). The first humanist groups formed in the United States, starting with the AMERICAN HUMANIST ASSOCIATION in 1947. Humanist organizations began forming or adopting the humanist label in many Western countries starting in the 1960s. By the turn of the twenty-first century, humanism had become a truly international movement with explicitly humanist organizations active in eastern Europe, Latin America, Asia, and Africa.

Conclusion. Over its twenty-five-hundred-year history, humanism has had many meanings. At least one meaning of humanism—perhaps the most salient today—is as follows: Humanism is the worldview of the nontheistic individual who is committed to the scientific method of inquiry; who considers all human knowledge fallible and even well-established principles and hypotheses subject to modification; who nonetheless believes that nature is intelligible to scientific reasoning and explainable by causal hypotheses; and who believes that through experience over time, human beings have developed a body of moral values which can serve as guideposts for living. Humanists believe that the good life is attainable by human beings, and that the challenge for humanists is to discover the conditions that best lead to happiness.

HUME, DAVID (1711–1776), English philosopher and skeptic. David Hume was one of the first philosophers to produce an autobiography: "My Own Life" is brief and by any standard extraordinary. After a few details about his family, Hume says he "passed through the ordinary Course of Education with Success." In fact, he attended the University of Edinburgh without taking a degree, but no doubt having learned a lot. He then tells us literature "has been the ruling Passion of my Life," and that his favorite authors were CICERO and Virgil. More than anything else, Hume was a writer, a creative artist working in words, and his written work is best read as a whole.

His Great Work. Hume produced mainly essays and history, some important letters, and what is by some considered the greatest philosophical treatise ever written in English, his *Treatise of Human Nature*, composed chiefly at La Fleche in Anjou (France) under a self-imposed resolution "to maintain unimpaired my Independency, and to regard every object as contemptible, except the Improvement of my Talents in Literature." The first two volumes of the *Treatise* were published in 1738. Hume expected the public to be shocked by his account of human nature, but they merely ignored it. Hume tells us, "It fell *dead-born from the Press*; without reaching such distinction as even to excite a Murmur among the Zealots." In December of 1737 Hume had written to Henry Home about a plan to submit the *Treatise* to Joseph Butler for his opinion. Butler, not yet a bishop but well known for his *Sermons* (1726) and very recently published *Analogy of Religion* (1736), is, along with John LOCKE, Earl SHAFTESBURY, Bernard MANDEVILLE, and Hutcheson, on the short list of what Hume describes, in the introduction to the *Treatise*, as "late philosophers in England, who have begun to put the science of man on a new footing." Hume tells Home, "I am at present castrating my work, that is, cutting off its nobler parts; that is, endeavouring it shall give as little offence as possible, before which, I could not pretend to put it into the Doctor's hands. This is a piece of cowardice, for which I blame myself, though I believe none of my friends will blame me. But I was resolved not to be an enthusiast in philosophy, while I was blaming other enthusiasms." The context indicates that what Hume took out of the *Treatise* was what eventually became his essay "Of Miracles." Hume had clearly made a close study of Butler, and with regard to both moral and general metaphysical questions seems almost a close colleague of Butler's, but on specifically religious questions not only do they differ, but the issue never seems properly joined. Once Butler became a bishop, Hume abandoned the idea of approaching him and there never was any exchange, which is a great pity. It is said that Butler later praised Hume's essays, and many critics have felt that the Cleanthes character in Hume's *Dialogues concerning Natural Religion* is based on Butler. This last point is especially important for the interpretation of Hume, since Hume makes Cleanthes the nominal winner of the debate, and describes the *Dialogues* as his most artful work. Most readers feel the Hume character, Philo, actually gets the better of the argument. It may be that Hume was more a writer than an advocate for anything and was encouraging readers to draw their own conclusions, just as Butler had suggested in the preface added to the second edition of his *Sermons* (1729). Hume tells Home he wants Butler's opinion because "my own I dare not trust to," a sentiment that may follow from Butler's sermon on the dangers of self-deception. The posthumous careers of Butler and Hume are also of interest. In his life, Hume eventually became known, indeed well known, not for his philosophical works but for his *History of England*. Butler's *Analogy* became one of the most successful works of Christian apologetics and was extraordinarily well known throughout the UK, Ireland, and the United States during the nineteenth century. By the 1920s the *Analogy* was almost forgotten, but Hume's philosophical work, and especially the *Treatise*, was well on its way to the recognition it had so long deserved. By the 1950s students of philosophy and theology were routinely told that the reason natural theology was no longer practiced seriously was because of the criticisms of Hume and Immanuel KANT. Kant, of course, acknowledged that Hume had awoken him.

Hume continued to rewrite his philosophy, and eventually met with some success, but not the sensation he had hoped for. Having finished the first volume of his history, he returned to the topic of religion and published his *History of Religion*, a very important and very sadly neglected work. Hume's final illness began in the spring of 1775, but he insisted on keeping his spirits up, telling us "I possess the same Ardor as ever in Study, and the same Gaiety in Company." By the end of this short autobiography, the ruling passion is not just literature but "my Love of literary Fame." Hume did not marry, but tells us he took "particular Pleasure" in the company of women.

Foundations of His View. What was Hume trying to do in his first and monumental work, the *Treatise of Human Nature,* a title taken from Hobbes and signaling his affiliation with the younger writers (Butler, Hutcheson, and Mandeville) who looked back to Shaftesbury

and Locke, and even to Francis Bacon? Of course, one theme is that our reasonings ought to be based on experience, our own experience, rather than traditional authority; but fully explicated, this becomes the bolder and more revolutionary theme, some would say what we mean by "Enlightenment," such as the notion that the resources of human nature are sufficient for all we need or want, without any God and without a godlike Reason (see ENLIGHTENMENT, UNBELIEF DURING THE). The great question, then as now, is whether one can toss out all that can be attributed to enthusiasm and superstition and still retain a system of godless virtue sufficient to maintain the life of the community. Thus stated, the stakes are high, so one needs to be motivated by recognition of the harm religion does.

Hume on Religion. Religion was, of course, a major topic of discussion in Scotland and England during the eighteenth century. The disputants felt justly proud they had learned—for the most part—to argue with words, however polemic, rather than fight to the death. Hume's texts on religion are absolutely fundamental for modern agnostic HUMANISM first, because it is in these texts that the position was first developed, second because the religious views are embedded in both a theory of knowledge and a philosophy of life, and third because Hume had good knowledge of and respect for his more important opponents.

"Of Miracles" and "Of a Particular Providence and of a Future State" were published in 1748, a decade after the first two volumes of the *Treatise*; "The Natural History of Religion" finally appeared in 1757, but the *Dialogues concerning Natural Religion*, one of Hume's greatest works both as philosophy and as literature, became available to the public only in 1779, three years after Hume's death.

"Of Miracles" is perhaps Hume's best-known single essay, a standard in beginning courses in philosophy, but the value and quality of his argument remains controversial even among those who strongly disbelieve in miracles and generally support the Humean position on religion. Technically, Hume is not arguing against the occurrence of miracles, but rather against our having good reason to believe that such have occurred. If miracles are, by definition, violations of a law of nature, then no matter what evidence, say from testimony, we have in favor of the miracle, all the evidence of whatever sort collected in support of the law of nature is necessarily evidence against the occurrence of the miracle, or of any event that violates that law. When Hume first proposed the argument, a Jesuit attempted to rebut it by saying it could not be valid, since if it defeated belief in latter-day miracles it would operate just as well against the gospel. Hume merely smiled at this reply, but it was many years before he dared to publish the essay. Some otherwise friendly critics, C. D. Broad, for example, have dismissed Hume's piece as nothing but sophistry, and clearly theologians have learned to define "miracle" so as to escape Hume's trap. Hume concludes the essay by pointing out that what he has said of miracles applies equally to prophecy. In Hume's time, and for more than a century after, apologists for religion presented miracles and prophecy as the "Christian evidences." Hume then ends with one of his most famous lines, "whoever is moved by Faith to assent to [the Christian Religion], is conscious of a continued miracle in his own person, which subverts all the principles of his understanding, and gives him a determination to believe what is most contrary to custom and experience." Humanists tend to hear only the sarcasm here, but there are still today sincere fideists who celebrate this conclusion.

"Of a Particular Providence and of a Future State" first appeared along with the essay on miracles, but it was the essay on miracles that caused the most excitement, and, as he had hoped, earned Hume notoriety as a controversialist. Even as the replies piled up in the 1750s, Hume generally ignored them. Much of Hume's work on religion is important just as a matter of fact in intellectual history, but all of it is significant as an unfolding in detail of the opinions of one of the great modern skeptics. "Particular Providence" is cast as a dialogue, but lacks the great literary quality of the *Dialogues concerning Natural Religion*. The "divinity," Hume says, may have attributes we have never seen manifested and may be governed by principles of action which we cannot discern, such may be the case but to us it is all "mere possibility and hypothesis." We cannot infer from what we have not observed, and we have not observed the consequences one would expect of the divinity according to religionists. What follows, and what most alarmed the religionists, is that even if some religious teachings are true and useful, such teachings can never take us beyond that which we could infer just by attending to the course of nature as experienced in ordinary life. Thus Hume, especially in his *Treatise*, finds common cause with the rational theologians and religious moralists who opposed, for example, the egoism attributed to Hobbes. But he insisted that the religious hypothesis at best did no good beyond what we could get from our human nature and experience, and at worst could do harm by appearing to support irrational beliefs and actions.

"Of Suicide" is of significance primarily because it raises the logical question of what it can mean to violate the divine will, since if the divinity is all-powerful it ought to be impossible to violate his will. Appreciation of the "Natural History of Religion" is hindered by its being a work of now quaint scholarship, an early study of the psychosocial origins of religion. Hume's project, remember, is to give an account of human nature that is free of any appeal to reason or to the supernatural, self-knowledge based entirely on experience. Such knowledge, Hume thought, would be most reliable and as such most useful. Since religion is a prominent part of life, it is necessary to account for the history of religion in accord with Hume's general phi-

losophy. To his credit, Hume does this himself rather than leaving the task to others.

Having expressed his skepticism regarding the justification of religion and having given a detailed account of its origins, Hume weaves his deepest thoughts on the subject into a superb work of art, *The Dialogues concerning Natural Religion.* Everything about this work is controversial and deeply puzzling, but that only adds to its philosophical value. Just as the last line of the essay on miracles can be taken in a way favorable to faith beyond reason rather than doubt within reason, the end of the *Dialogues*, in which the character who propounds the argument from design is pronounced the winner, can be take as sympathetic to religion in the end; but such an interpretation is supported only by a small minority of critics. Most of those who know Hume best recognize he is here being ironic, as he often is elsewhere. But Hume's irony is an especially clever and thoughtful irony, and the main conclusion seems to be that one must think for oneself. Hume is confident those who do examine the matter de novo will, if they maintain a clear and open mind, come to reject all the pretensions of religion, but in the *Dialogues*, at least, he presents his (Philo's) opponents (Cleanthes = Bishop Butler, Demea = Samuel Clarke) in their best possible light. The argument tilts back and forth, with the relations among the characters constantly in flux.

Later Life and Influence. James Boswell visited Hume shortly before his death and recorded an entirely agreeable account of his final thoughts on religion and a future life. At one point, Boswell described him as "indecently and impolitely positive in his incredulity," a character we can see in his writings if only less explicitly. In his magnificent little essay "My Own Life," Hume repeatedly insists that he died pleased with the reception of his work in his own time, even if he had hoped for greater acclaim. Certainly he was widely appreciated for his *History of England.* After his death, he was ill treated by many philosophers far less talented, but his strongest early opponent was another Scot, and a very great philosopher, Thomas Reid. Kant's acknowledgment that it was Hume who woke him from "slumber" is well known, but it does not appear that Kant made any close study of Hume's own writing. So, it was only in the early twentieth century that serious philosophical interest in Hume began to build, but that momentum eventually brought him to the very highest ranks of esteem by a nearly unanimous vote. Those with even the slightest interest in philosophy or religion can only be urged not to read too much *about* Hume but to make a careful and close study of his own words. The arguments, even when dated or sophistical, are always entertaining and have a marked tendency to induce enlightenment.

HUMPHREY, JOHN PETERS (1905–1995), Canadian diplomat and principal author of the United Nations Universal Declaration of Human Rights. John Humphrey was born in Hampton, New Brunswick. After high school he trained as a lawyer, being called to the bar in 1929. He practiced law privately for six years before joining the law faculty at McGill University in Montréal, where he lectured for ten years. In 1946 he was appointed as the first director of the Human Rights Division of the United Nations. Within two years, the United Nations ratified and adopted the Universal Declaration of Human Rights (UDHR), of which Humphrey was the principal author. Eleanor Roosevelt was a member of the executive group that ratified Humphrey's draft with only slight modifications.

He continued to work as a diplomat for the UN for about twenty years, during which period he oversaw the implementation of sixty-seven international conventions, in addition to assisting in the drafting of new constitutions consistent with the UDHR for literally dozens of countries. In 1963 Humphrey first proposed the establishment of a UN High Commissioner for Human Rights; thirty years later, that position was ratified by then–secretary general Boutros Boutros-Ghali.

In 1966 he returned to McGill University and resumed his teaching career. Concurrently, he was a Director of the International League for Human Rights and served on the Royal Commission on the Status of Women. Along with others, he participated in the creation of Amnesty International Canada as well as the Canadian Human Rights Foundation. In addition, he served on several international inquiries into human rights violations, such as in the Philippines under Marcos and abuses of Korean women by the Japanese, as well as securing reparations for Canadians who had suffered in captivity during World War II.

Among the thirty articles of the UDHR, two are of special interest to freethinkers. Article 18 asserts, "Everyone has the right to freedom of thought, conscience and religion; this right includes freedom to change religion or belief and to manifest such religion or belief," and Article 19 asserts, "Everyone has the right to freedom of opinion and expression; this right includes freedom to hold opinions without interference."

In 1974 Humphrey was made an Officer of the Order of Canada "in recognition of his contributions to legal scholarship and his world-wide reputation in the field of human rights." In 1988, on the fortieth anniversary of the UDHR, he was granted the Human Rights Award by the UN. He died in Ottawa in March 1995.

GLENN HARDIE

HURSTON, ZORA NEALE (1891?–1960), American author and humanist. One of the most complex, contradictory, and fascinating figures of the twentieth century, Zora Neale Hurston was an essayist, anthropologist, novelist, storyteller, and journalist. Moreover, she wrote, directed, produced, and starred in plays and musicals. Hurston often distorted the truth even concerning some of the most important details of her life. For example, she claimed that she was born in Eatonville, Florida, the first incorporated black community in the United States. However, some researchers believe she might have been born in the less historically resonant town of Notasulga, Alabama.

Hurston graduated from Baltimore's Morgan Academy, a high school affiliated with historically black Morgan College, now Morgan State University. She went to historically black Howard University, eventually receiving a BA in anthropology from Barnard College and Columbia University.

Hurston was a major figure during the Harlem Renaissance, widely regarded as the top expert on black culture of the day. In 1928 she wrote her best-known essay, "How It Feels to Be Colored Me." In 1934 her first novel, *Jonah's Gourd Vine*, was published. In 1935 she wrote *Mules and Men*, in which she examined voodoo practices among African Americans in Florida and New Orleans. In 1937 her most important novel, *Their Eyes Were Watching God*, was published. In 1938 she wrote *Tell My Horse*, about her travels and the practice of voodoo in the Caribbean. The following year she wrote another novel, *Moses, Man of the Mountain*.

In 1942 Hurston wrote her autobiography, *Dust Tracks on a Road*. Most scholars doubt its veracity; others believe it contains so many errors, omissions, fantasies, and outright lies that it can hardly be said to be a genuine autobiography. In the book, Hurston said that her father was a Baptist preacher. However, she raised difficult theological questions throughout her childhood, especially when she overheard other church members laughing about some of the testimony at the services her father conducted. Despite her doubts, she did not reject religion as a child.

In college, Hurston studied the history of religion and concluded that the "great" religions were anthropocentric creations of the human imagination (see ANTHROPOMORPHISM AND RELIGION). She came to believe that religion and prayer are rooted in fear and insecurity. After rejecting religion she seemed to have found the inner peace that most religionists seem to believe only comes from God. However, like the unbelievers Langston HUGHES and writer James Weldon Johnson, she continued to be fascinated with religious themes and the drama of religion.

Hurston was the target of many attacks by secular humanists. Though many women now regard her as a groundbreaking feminist, she supported reactionary politicians of her day. While her work expressed themes consistent with black nationalism, she wrote that slavery was beneficial because it gave blacks civilization. She went so far as to oppose *Brown v. Board of Education*, the 1954 Supreme Court decision that made segregation illegal.

Hurston died on January 28, 1960, broke and forgotten. The 1970s ushered in a rediscovery of the woman and her work. Today publishers are reissuing her once-forgotten works. Numerous Web sites are dedicated to her life and work. She has been the subject of significant essays, and her plays have been produced. Many festivals that bear her name—particularly the Zora Neale Hurston Festival held every year in Eatonville, her probable nonhometown—are held annually. Journals, foundations, literary societies, and awards have been launched in her name, and she is the subject of numerous biographies. In 2005, a new Broadway musical called *Eatonville* was under development, with music written by the Grammy Award–winning jazz trumpeter Wynton Marsalis. Her niece, Dr. Lucy Hurston, signed a contract with Doubleday to author a book on the Hurston family titled *Now You Cookin' with Gas*.

Perhaps the ultimate proof of Hurston's enduring popularity occurred on Sunday, March 6, 2005. On that day, Oprah Winfrey presented a major network television adaptation of the novel *Their Eyes Were Watching God*. The program starred Academy Award–winning actress Halle Berry as Janie.

NORM R. ALLEN JR.

HUXLEY, JULIAN (1887–1975), English humanist scientist and philosopher. Julian Huxley was a major shaper of neo-Darwinism, but we will focus on his contributions in philosophy and religion. In 1946 he became the first director general of the United Nations Educational, Scientific and Cultural Organization (UNESCO) but resigned when it became clear that most nations were not ready for his kind of scientific humanism (the United States played a central role in this rejection).

Thomas H. HUXLEY, his grandfather, had been Charles DARWIN's great defender, but focused on a view of nature as, in Tennyson's phrase, "red in tooth and claw." In his 1893 Romanes Lecture he had argued that human ethics must combat the "gladiatorial" life of prehuman animals. Julian's 1943 Romanes Lecture, however, saw human social evolution as producing the many kinds of human ethics, and saw modern science as helping choose among them.

In the 1920s he was already hailing a new religion "without revelation" (and of course without supernatural entities), and in his 1952 founding presidential address to the INTERNATIONAL HUMANIST AND ETHICAL UNION he reiterated his argument that once we humans understood evolutionary processes, both biological and social, we became responsible for them. He even argued there that we should study yoga and mystical belief systems scientifically, so that we could utilize any of their good features without relying upon improbable beliefs.

In his commemoration address at Chicago's 1959 Darwin celebration, broadcast internationally, the stress he laid upon human responsibilities in an evolving but designless universe shocked many hearers as he outlined "the Humanist view of the three great activities of man in which he transcends the material business of making a living—art, science and religion. . . . Art opens the doors of that other world in which matter and quantity are transcended by mind and quality. . . . [Science is] the process of discovering, establishing, and organizing knowledge."

As for religion—now was the time to "to replace the multiplicity of conflicting and incompatible religious systems" with a "scientific theology." We should view religion as "applied spiritual ecology" whereby men and women come to understand the world around them, themselves, and all other humans more effectively.

Huxley came down hard here on those positivist philosophers who regarded human values as subjective nonsense, and on those Marxists (see MARXISM) who absolutized Trofim Lysenko instead of subjecting his pseudoscience to normal verification.

Huxley chose to include this Chicago speech in his 1962 volume including essays by twenty-five distinguished scholars who were willing to allow him to label them as "humanist." They come from a wide range of disciplines; many had met during two post-UNESCO years in an Idea-Systems Group that he had assembled. The assumption was that "the knowledge-explosion of the last hundred years was providing man with a new revelation, a new vision of his destiny." The first critical event in the past of evolution came when the process "transcended itself," passing from the inorganic to organic life; the second was the transition to the "psychosocial." We are now, he argued, at the threshold of "a consciously purposive phase." The best label for this is "evolutionary humanism."

Huxley is clearly the type of humanist who redefines concepts rather than rejecting them. His own scientific writings ranged from the very technical to the quite popular, and he stretched his own expertise with a lifelong commitment to birdwatching. He befriended the Jesuit and evolutionary paleontologist Pierre Teilhard de Chardin (whose own church had forbidden him to publish), and wrote the preface for *The Phenomenon of Man*, one of Teilhard's posthumous publications. Huxley could appreciate Bishop John Robinson's radical rethinking of Christianity (in the best-seller *Honest to God*) but still say that this, like Paul Tillich's parallel efforts, was trying "to keep his cake and eat it" in retaining the ambiguous god concept.

"Today the god hypothesis has ceased to be scientifically tenable, has lost its explanatory value and is becoming an intellectual and moral burden to our thought," he declared. Nevertheless some "outer" events (hurricanes, death) and some "inner" events (inspiration, possession, insanity) are "awe-inspiring" and "divinity-suggesting," and can seem "transnatural" (although, of course, not supernatural): "The new religion of evolutionary humanism will explore these, but always within the new centrality: promote further evolutionary improvement and to realize new possibilities; and this means greater fulfilment by more human individuals and fuller achievement by more human societies."

Huxley retained many traditional terminologies to make contact with his readers (divinity, theology, religion, inspiration) and also used descriptive terms from anthropology such as *possession*. But these were continually recast into his radical evolutionism. That basically naturalistic framework, coupled with his high visibility, made him one of the paramount unbelievers of the twentieth century. The need of the world is, as he put it, "not merely a rationalist denial of the old but a religious affirmation of something new."

Understandably, speculation continues about the possible role of genetics in this very accomplished family, which also produced his brother Aldous and his sons Francis (prolific anthropologist) and Anthony (prolific biologist). Gavin de Beer, in his preface to Ronald Clark's *The Huxleys*, said, "There can be few men more religious, in the proper sense of the word, than T. H., Julian, and Aldous, devoting all their energies and gifts to improving the sorry lot of men, without mummery, petitionary prayer, or superstition."

ROBERT B. TAPP

HUXLEY, THOMAS HENRY (1825–1895), English naturalist and essayist. Thomas Huxley was born on May 4, 1825, in the country village of Ealing, the youngest of seven children of George and Rachel Withers Huxley. His schooling was irregular, but even as a young boy he was interested in a staggering array of subjects. From James Hutton he learned about geology. From Sir William Hamilton's "The Philosophy of the Unconditioned" he embraced the skepticism that typified his mature thought. From Thomas Carlyle he developed sympathy for the poor that was later reinforced by his exposure to the squalor and poverty he saw in the East End of London. He taught himself German to read Goethe and Kant in the original. This would serve him well in later years, allowing him to become acquainted with the tremendous biological advances being made in Germany that few English men of science were able to follow. He began studying medicine at quite a young age and received a scholarship to the medical school attached to Charing Cross Hospital. Except for physiology, most of the medical curriculum bored him although he did extremely well. Between 1846 and 1850 Huxley traveled around the world as assistant surgeon on the HMS *Rattlesnake*, resulting in some of his most important scientific work. He met his future wife, Henrietta Anne Heathorn, while visiting Australia. They married in 1855 and had a long and happy marriage and seven children.

Huxley's life was one of incessant activity. He lectured at the School of Mines and was also a professor at the Royal College of Surgeons. Evenings were often spent speaking before working men or learned societies. He was president of numerous societies, including the British Association for Advancement of Science (BAAS), the Geological Society, and the Ethnological Society. He authored several hundred scientific monographs as well as countless popular essays. Huxley's early work from the *Rattlesnake* voyage established his reputation within the scientific community, but it was his defense of DARWINISM that brought him into the public spotlight. His famous encounter with Bishop Samuel Wilberforce at the 1860 meeting of the BAAS was an important milestone in his career (see EVOLUTION AND UNBELIEF; DRAPER, JOHN WILLIAM). Not only did it ensure that Charles DARWIN's theory received a fair hearing, but it let the public know that that he was a force to be reckoned with in the world of science and religion.

Huxley's interests were not confined to science. He loved music, art, and literature, and was a member of two famous London clubs: the X Club and the Metaphysical Society. The X Club was founded in 1864 at his suggestion in order for his scientific friends to keep in touch with one another. The Metaphysical Society's members represented the intellectual elite of London society. It provided the perfect forum for Huxley to present his views on theological and metaphysical questions, religion, and the nature of knowledge.

It was Huxley's membership in the Metaphysical Society that caused him to coin the word *AGNOSTIC* to describe his own belief system and to distinguish it from other –isms, such as POSITIVISM, MATERIALISM, ATHEISM, and even empiricism. It was meant to be antithetic to the "gnostics" of church history, who claimed to know so much about the very things of which he was ignorant. Typically agnosticism is thought to be concerned with religious belief. However, this was not Huxley's original meaning. Rather, agnosticism represented an epistemological claim about the limits to knowledge. Building on the Kantian principle that the human mind had inherent limitations and further elaborated by David HUME, Huxley maintained that our knowledge of reality was restricted to the world of phenomena as revealed by experience.

Huxley was often called a materialist, which he firmly denied. However, it is easy to understand why people labeled him one. On the tree of knowledge his idiosyncratic definition of materialism placed materialistic terminology on the branch of physics while materialist philosophy went on the twig of metaphysics. Materialist methodology had led to tremendous advances in physiology and psychology. However, for Huxley materialist philosophy involved "grave philosophical error," because we know the material world only by the forms of the ideal world. The fundamental doctrines of philosophical materialism, like those of spiritualism, lay outside the limits of philosophical inquiry.

Agnosticism is perceived as having an antireligious bias, in part because Huxley was well known for his polemics against theology. While agnosticism certainly challenged orthodox Christianity, it also placed limits on the kinds of phenomena science could explain as well. Theological and metaphysical questions interested Huxley, but he regarded science and philosophy as occupying distinct domains. On questions that were not amenable to the scientific method, those that went beyond the cognizance of the five senses, he declared himself an agnostic. He had no reason for believing in

immortality (see IMMORTALITY, UNBELIEF IN), but he also had no means of disproving it. He drew distinctions between religion, theology, and science. Religion belonged to the realm of feeling, and he claimed that a deep sense of religion was compatible with the entire absence of theology. Science and theology, while distinct, belonged to the realm of the intellect as they both made empirical claims about the nature of the world. Therefore, theological claims must be subject to the same standards of proof as scientific ones. Theology would become "scientific" when the scriptures were treated as a collection of ordinary historical documents and analyzed using the research methods of philology, archaeology, and natural history. Huxley had tremendous antagonism toward natural theology, often attributed to his belief in Darwinism. However, his enthusiasm for evolution was in part due to the absence of theology in Darwin's theory. He used Darwin's theory to promulgate his antitheological and anticlerical views (see ANTICLERICALISM), and as a vehicle to gain power in intellectual, institutional, and political arenas.

More than anyone else, Huxley was responsible for disseminating Darwin's theory to the Western world. However, Huxley had a research program established long before he went to battle against the enemies of evolution. In spite of dubbing himself "Darwin's bulldog," he was skeptical of the two basic tenets of Darwin's theory—natural selection and gradualism. Pre-*Origin*, Huxley did not believe in transmutation because the work of Karl Ernst von Baer and Georges Cuvier as well as his own research suggested that organisms could be grouped into discrete types and that no transitional organisms existed between them. While his early work from the *Rattlesnake* superficially appears to be merely a series of detailed monographs on various invertebrates, he had a much more ambitious agenda. He wanted to provide a theoretical foundation for taxonomy in order to understand how form came to be generated. The concept of type was crucial to this enterprise. With the publication of *Origin of Species* in 1859, Huxley recognized that the unity of type he was observing was the result of descent from a common ancestor. Darwin also claimed that species gradually change. But Huxley argued that saltation or evolution by "jumps" better described the geological record with its abrupt appearance of most forms. Saltation allowed Huxley to explain the gaps in the fossil record, accept evolution, and maintain a belief in the concept of type. Huxley eventually converted to gradualism as more and more transitional organisms were found. *Archaeopteryx* and the birdlike dinosaurs led Huxley to argue that dinosaurs were the connecting link between reptiles and birds. Natural selection was not relevant to the kinds of questions that interested Huxley. Although he thought it would eventually be proved, he remained skeptical about the power of natural selection to cause new species, rather than just well-marked varieties. However, this difference with Darwin was not so much over natural selection or even the interpretation of experimental results, but rather over what constituted proof of a hypothesis.

Man's Place in Nature is Huxley's most famous work. Published in 1863, eight years before Darwin published *Descent of Man*, Huxley provided compelling evidence that humans were no exception to the theory of evolution. Claiming that the classification of humans should be determined independent of any theories of origination of species, Huxley removed the question of human ancestry from theological concerns. This allowed him to promote his larger agenda of keeping theology and science distinct domains.

Huxley oversimplified the conflicts surrounding Darwinism; they cannot be reduced simply to an analysis that describes science as at war with religion (see RELIGION IN CONFLICT WITH SCIENCE). However, Huxley correctly recognized that the battle for the acceptance of evolution had to be fought on theological grounds not only in the public arena, but also within the scientific community. While Huxley's philosophical views provided the framework for his scientific views, his experience as a scientist provided the framework for his philosophy. René DESCARTES's "consecrated doubt" underlay his agnosticism and resulted in his belief that science was the path to knowledge. Thus, in spite of coining the word *agnostic*, Huxley was not deeply involved with the many agnostic societies that sprung up. It was only at the end of his life that he wrote a series of essays that were specifically a defense of agnosticism.

SHERRIE LYONS

HYPATIA OF ALEXANDRIA (355–417 CE), philosopher and mathematician. Hypatia is the first well-known woman philosopher, mathematician, and professor. Her birth year was once considered to be 370 CE, but scholars have placed it earlier, at around 355. Her father was Theon, the noted Alexandrian mathematician and leader of the Museum (what we would today call a university). Hypatia was educated by her father in mathematics, astronomy, and some philosophy. Theon wrote about Ptolemy and Euclid, and Hypatia shared his interest in these men and their body of work. Hypatia had a further interest in philosophy, and according to some sources traveled to Italy and Greece to further her education in the philosophy her father couldn't teach her.

Upon her return to Alexandria, Hypatia became the leader of the Neoplatonic School of Alexandria. She became a revered teacher, who pursued varied scholarly interests, including the invention of the astrolabe, her work in philosophy, and teaching. Hypatia was also a confidante of Orestes, the governor of Alexandria. As a woman, a pagan, a scholar, community leader, and friend of the governor, she became the focal point for the clash between the old world (paganism) and the new (Christianity).

In 415 Hypatia was set upon by an angry mob of Christians and brutally murdered. Her body was hacked apart and her remains burned by the mob. Cyril, the patriarch of Alexandria, may or may not have been directly involved in her demise. Cyril's motives for either instigating or directly ordering the murder can be attributed to his religious fervor to rid Alexandria of pagans. There may also have been political overtones, as Cyril had been trying to consolidate his power in the city.

It is important to note that Hypatia, while a pagan in the strict sense of the word, really did not practice paganism. She was lumped into the group because she was a mathematician, scientist, and astronomer—and because she was not a Christian. Astronomers and mathematicians were placed into the same category as numerologists and astrologers, and scholarship was an enemy to Christians at this time as well.

Hypatia's death is seen by many as marking the end of the classical world. The great Museum and libraries were systematically being destroyed and replaced by churches. Scholars began to flee Alexandria, perhaps the greatest learning center of the time; the slow decent to the Dark Ages had begun.

There is a romantic notion among unbelievers that Hypatia was a martyr. Christian apologists have tried to show Hypatia as a villain, a witch, or a magician (all tied to her mathematics), while unbelievers portray her as making a stand against the Christians. Hypatia's death was only loosely associated to her religious attitudes; her death was more a product of her era rather than the result of any conscious stand against Christianity.

TIMOTHY BINGA

IAROSLAVSKII, EMEL'IAN MIKHAILOVICH (Minei Izrailevich Gubel'man; 1878–1943), Soviet atheist leader. A key party ideologist, Emel'ian Iaroslavskii served the Communist Party of the Soviet Union as an administrator, antireligious activist, party historian, and prolific author (see PROPAGANDA, ANTIRELIGIOUS [SOVIET]).

Early Life. Iaroslavskii was born to poor Jewish exiles in the eastern Siberian city of Chita in 1878. Despite only three years of formal schooling, Iaroslavskii developed a passion for self-education and was drawn to the writings of populist and Marxist revolutionaries. In 1898 he became a Social Democrat. Until 1917 he promoted revolution in cities across Russia, enduring arrests, imprisonment, and exile.

Political Work. Part of the Stalin faction, Iaroslavskii was a longtime member of the Party Central Committee. From 1933 he was a member of the Central Purge Commission, later the Party Control Commission. Iaroslavskii also held posts in the Soviet government as a member of the Central Executive Committee from 1923 to 1937 and from 1938 until 1943 as a deputy of the Supreme Soviet.

Historical Activity. Iaroslavskii was a founder of the field of party history and participated in the bitter struggles within the historical profession in the 1920s and 1930s. He was the author of textbooks and numerous propagandistic works, including biographies of Lenin and Stalin. He was elected to the Academy of Sciences of the USSR in 1939.

Antireligious Activity. One of the leading architects of Soviet antireligious policy, Iaroslavskii chaired the Central Committee's Antireligious Commission from 1923 to 1929. He founded the League of the Militant Godless in 1925 and served as its president until its demise in 1941. Under his guidance, the league sponsored antireligious campaigns and an active publishing program aimed at creating a new atheistic culture. Iaroslavskii was founder, editor, and frequent contributor of the league's weekly newspaper, *Bezbozhnik* (Godless). He authored some 440 articles and books on antireligious subjects. The most famous was his *Bibliia dlia veruiushchikh i neveruiushchikh* (The Bible for Believers and Nonbelievers, 1923–25), a detailed study of the Old Testament in which he sought to popularize

the findings of biblical criticism. It went through many editions up to the late 1970s and was translated into several languages.

IKHNATON (Akh-en-ton; 1372–1354 BCE), Egyptian monotheist pharaoh. The son of Amenhotep III and husband of Nefertiti, Ikhnaton became pharaoh of Egypt as Amenhotep IV. Once on the throne he changed his name to Ikhnaton (some spell it as Akh-en-ton, often translated as "he who is serviceable to Aton"). The name change is indicative of a change in religion in which he installed Aton, symbolized by the sun disk, as the sole god. He also moved the capital from Thebes to Tel-el-Amarna. His attitude toward his god is expressed in a hymn to Aton that shows the universality and beneficence of Aton. James Breasted, the early twentieth-century historian of Egypt, was struck with the semblance of the hymn to the 104th Psalm and believed there was a direct relationship between the two. Because Ikhnaton was devoted to this God alone, the Amarna religion has been called monotheistic by Breasted and others, and he has been regarded as sort of a founder of monotheism. This assumption has since become debatable. Though it is clear that Ikhnaton and his family worshiped Aton, his courtiers worshiped Ikhnaton himself, while the great majority of Egyptians were either ignorant of or hostile to the new faith.

Though the light of Aton was supposed to benefit all races of mankind, Ikhnaton was a disaster as a ruler. In pursuing his mystical dream he ignored his governmental functions, and his empire crumbled away, the government more or less disintegrating as his own representatives betrayed him. Still, the so-called Amarna period saw remarkable stylistic changes in art, if only briefly. Differences between the sexes appear to be almost obliterated. Men and women of the upper circles imitated the royal couple in wearing identical loose garments, so thin and diaphanous that they revealed that the ideal image of the body underneath was virtually the same. Some have argued that the reason for this is that the king regarded himself as having the male and female principles united in his own person. Whatever the reasons, the changes were short lived. His successors reverted to the worship of the old gods, and restored old customs and traditions. The "new center" of the kingdom at Amarna was abandoned.

BIBLIOGRAPHY

A standard translation of the Hymn to the Aton is by John A. Wilson who also points out the similarity to verses in the 104th Psalm. It was printed in volume 1 of James B. Pritchard, *The Ancient Near East, An Anthology of Texts and Pictures*, a collection often reprinted.

IMMORTALITY, UNBELIEF IN.

Who would fardels bear,
To grunt and sweat under a weary life,
But that the dread of something after death,
The undiscover'd country, from whose bourn
No traveller returns, puzzles the will,
And makes us rather bear those ills we have
Than fly to others that we know not of?
Thus conscience doth make cowards of us all . . .
Shakespeare, *Hamlet*, I, iii

Shakespeare's Hamlet, as he mused in this way, was assuming that as a flesh-and-blood human being, a person, he was really and essentially an incorporeal spirit enjoying (in the context of eternity) strictly temporary control of his human body. It was to conscience, in this present sense of consciousness, that Albert Einstein was referring when he remarked during a conversation with Herbert Feigl that "[i]f there were not this internal illumination, then the Universe would be a mere rubbish heap."

In discussing the present subject we must never forget that until the beginnings of modern science, absolutely everyone believed that the universe was full of incorporeal spirits endowed with active powers. But such spirits were ill equipped to serve as the hypothetical entities of an explanatory theory, for no one was able to propose any way in which such spirits could be identified without reference to the very movements they were being introduced to explain. Nor, once such a hypothesis had been adopted, were there any fresh and testable inferences that could be drawn from it.

It is worth quoting here an illuminating comment made by Herbert Butterfield in his classic work on *The Origins of Modern Science*: "The modern law of inertia, the modern theory of motion, is the great factor which in the seventeenth century helped to drive the

spirits out of the world. . . . Not only so—but the very first men who in the middle ages launched the great attack on the Aristotelian theory were conscious of the fact that this colossal issue was involved in the question. . . . Jean Buridan in the fourteenth century pointed out that his first alternative would eliminate the need for the Intelligences that turned the celestial spheres. He even noted that the Bible provided no authority for these agencies."

But it appears to have been several centuries before this elimination from classical mechanics of the conception, or misconception, of incorporeal agent spirits began—at least in the English-speaking philosophical world—to have any effect on either the philosophy of mind or the philosophy of religion. Indeed, until the publication of Gilbert Ryle's *The Concept of Mind*, the standard work on the philosophy of mind, to which beginning philosophy students were routinely referred, was C. D. Broad's *The Mind and Its Place in Nature*.

Broad himself was much interested in, and published a volume of his own essays about, what was then called psychical research. That discipline has since been developed and extended into parapsychology. Psychical research was mainly, although not quite exclusively, concerned with putative communications between living people and the supposedly surviving spirits of their deceased friends and relatives. These putative communications were usually mediated by professional mediums, who were almost exclusively females.

To achieve any firm and relevant findings about—and from—the putative mediumistic performances of any supposed medium, it is necessary first somehow to establish that at last some of her utterances during some particular sitting were really expressed by a spirit who had survived his or her own death. To achieve this ambition it would be necessary first to identify the putative communicator as being a disembodied spirit, and then to reidentify him or her as the disembodied spirit of some particular person now deceased. This achievement is much more easily described than actually compassed. For when supposed spirits of one particular deceased person provide information about their alleged prior lives on earth, or even speak in a manner that is peculiar to and characteristic of the persons whose putative spirits are supposedly communicating through the mouth of the medium, it is still very difficult to rule out the possibility that that medium acquired that information in some perfectly normal way, and is making use of it quite innocently.

It is only when we come to consider the eschatological teachings of the two great revealed religions, Christianity and Islam, that we are forced to recognize that the notices that were at one time to be seen outside US Army Air Force bases—"Drive carefully, death is so final!"—were not expressions of an undiscussably obvious known truth. For both of the two great monotheistic religions claim to reveal that, after our merely earthly deaths, all of us human beings will, whether immediately or ultimately, become occupants of an eternal heaven or—more likely—an eternal hell.

The question of a future life is one that, although it is not specifically mentioned in Adam Lord Gifford's will, one might expect to see discussed fairly frequently in a series of lectures that famously included William James's *The Varieties of Religious Experience*. But in fact there was no series of Gifford lectures on immortality—what, for Immanuel KANT, was the third of the three great questions of philosophy—between those of A. S. Pringle-Pattison, published in 1922, and those of Richard Swinburne and those of Antony Flew, both published in 1986.

The crucial stimulus to one if not to both of these two latter writers was the publication in 1948 of Gilbert Ryle's *The Concept of Mind*. In that work Ryle's fundamental contention was that the word *mind* is not a word for an entity that could significantly be said to survive the death and dissolution of the flesh-and-blood person whose mind it had been. For—and Ryle himself would have enjoyed putting the matter in this way—to construe the question whether she has a mind of her own as a question about a hypothesized incorporeal substance would be like taking the loss of the Red Queen's dog's temper as it if was on all fours with the loss of its bone, or like looking for the grin remaining after the Cheshire Cat itself had disappeared.

Ryle, probably for very good political reasons, neither attempted nor encouraged others to attempt to apply a similar critique to the concept of soul. But Richard Swinburne, in a recent paper titled "The Possibility of Life after Death," begins by claiming "that a human on Earth consists of two interconnected parts (two substances in philosophical terminology)—body and soul. The body is material, the soul is immaterial. The soul is the essential part of the person; it is the continuing of my soul which constitutes the continuing of me." He concludes this initial paragraph by expressing the hope that he can, in his paper, "prove to you that there is a soul for something to happen to." What is so very remarkable is that Swinburne should have hoped to establish this conclusion without attempting to explain either how individual spiritual substances are to be identified in the first place or later reidentified as the same individual spiritual substances. Instead, after first disposing of "hard materialism," as he terms it, he attempts to dispose of "soft materialism." Soft materialism, for Swinburne, says that you have told the whole story of the world when you have said what material objects exist and which properties (mental and physical) they have. However, full information of this kind would still leave one ignorant of whether some person continued to exist or not; knowledge of what happens to bodies and their parts will not show you for certain what happens to persons.

It is hard to understand how Swinburne could have persuaded himself that this is a compellingly powerful argument. For surely no one, not even one of Swin-

burne's misbegotten hard materialists, would ever want to deny that there is a very real and enormously important difference between living and dead human beings. Surely, too, full knowledge of all the properties, both mental and physical, of a human being has to include knowledge of whether he or she was alive and conscious or already dead at the time in question.

At this point Swinburne tries to make much of the facts that the human brain consists of two hemispheres and brain stem, and that human beings can survive and behave as conscious beings even if much of one hemisphere is destroyed. He then asks the reader to suppose that his own brain (hemispheres plus brain stem) was divided into two, and each half brain was then taken out of Swinburne's skull and then transplanted into the empty skull of another body from which the brain has just been removed; and there to be added to each the half brain from some other person—along with whatever other parts are necessary for there to be two living persons with lives of conscious experiences. Swinburne then asks: "Which of the two resulting persons would be me?"

The important thing to be said about this question is that it is a question with no antecedently correct answer. If such a question came before the courts for a decision, the case would be one of those in which a predicament has arisen the possibility of which had not been foreseen by the original legislators. It therefore requires later lawyers to decide what in future correct legal usage is to be. A previous discussant of a similar problem referred to an actual twentieth-century case in which a court had had to decide whether, under a law introduced in a much earlier century, a flying boat was or was not a ship.

Something must be said here about the difficult and controversial subject of ARISTOTLE. For it was upon suggestions he found in what Thomas HOBBES described as "the vain philosophy of Aristotle" that Thomas Aquinas developed his own teaching that the separable but separated and still-surviving form or essence of an individual person would maintain the identity of that individual person over the time gap between his or her death and his or her resurrection. Aquinas appreciated that, without some such maintenance of identity, God would have been punishing or rewarding not the actual whoever-it-was, but only a no-doubt-perfect replica of that former person.

Aristotle's most characteristic and fundamental thesis is that the life or soul is the form, or essence, the what-it-is-to-be (the "quiddity") of any particular organism. This Aristotelean notion of a form or a quiddity—that last a barbarous term derived from Scholastic Latin—is tricky and must be firmly and with special care distinguished from that of PLATO's Forms or Ideas. Certainly an Aristotelean form is no more a corporeal thing than a Platonic Form would be. But then it is not a spiritual one either. It is not, in the crucial philosophical sense, a substance at all. The soul as an Aristotelean form stands to the stuff of a body as the configuration of a statue stands to the materials of which it is made, as vision stands to the eye capable of seeing, as cutting power stands to the serviceable axe (these illustrative examples all come from Aristotle himself). So it is obvious that the Aristotelean soul is not separable from the body and, furthermore, that this inseparability must be a matter not of physical but of logical impossibility. It is upon this insistence that we must rest Aristotle's claim to be regarded as the patron of all monistic and materialistic views of the nature of man.

Against this there was a hermeneutic tradition, descending from Alexander of Aphrodisias through AVERRÖES (respected by the Scholastics as the Commentator), that attributed to Aristotle a belief in some sort of eternal intellect. But whatever this does amount to, it quite clearly is not a doctrine of the immortality of individual human souls. That was fully appreciated by Aquinas, who was moved to compose, with unwonted heat, a polemical pamphlet *de unitate intellectus contra Averroistas Parisienses* (On the Unity of the Intellect against the Parisian Averroists).

One kind of reason that might be proffered for saying that the abstract intellect (or, for that matter, any other putative abstract reality) is essentially eternal is, really, no sort of reason for saying that anything at all goes on forever. Certainly it is, in a way, correct to say that such things as logically necessary truths and logical relations between concepts are somehow timeless and eternal. Yet this is equally certainly not a matter of anything eternal actually existing, but rather of its just not making sense to ask temporal questions about the periods during which these truths and these relations obtain. For eternity, in this sense, we can have nothing either to hope or to fear.

Third, supposing Aristotle really had wanted to suggest that individual intellects could and would survive, then presumably a large part of his reason would have lain in his belief that ratiocination, unlike sight or hearing, is not localized in any organ. Even if that belief had turned out to have been erroneous, it would still have been necessary to insist that the absence of any specialist (corporeal) organ provides no justification for assuming that our intellectual attributes must, or even might, be those of incorporeal substances. The lack of specialist organs of volition is surely not to be construed as providing grounds for seeking invisible and immaterial sources to which to attribute people's feeling happy or feeling depressed. These and other more intellectual characteristics are, simply and obviously, attributes of the flesh-and-blood people concerned.

Aristotle himself never employed any such easily disposable argument. What he actually argued about the intellect was that, "since it thinks all things, it must [in the words of Anaxagoras] be unmixed with any if it is to rule, that is, to know." This idiosyncratic saying has sometimes been construed as an expression of a belief that our intellects are both incorporeal and yet (in the philosophical sense) substances: a belief which might seem to mesh in well with Aristotle's undoubted convic-

tion that to know abstract truths is something rather grand, divine even—an essential characteristic of the most superior sort of person.

Certainly, as he makes very clear in the *Nicomachean Ethics*, Aristotle did believe that both the highest style of life and the happiest is the life of the intellect; and that anyone who attains this lifestyle attains it "in virtue of something within him that is divine." But the cherishing and attaining of an ideal of this kind is entirely consistent with a rejection of any belief in the reality of individual immortality.

The nearest Aristotle came to deploying formal argument in support of his doctrine of the soul, whatever it may be, is in the first chapter of book 1 of the *Metaphysics*. He began: "Doubtless it would be better not to say that the soul pities or learns or thinks, but that the man does so with the soul; and this too not in the sense that the motion occurs in the soul, but in the sense that the motion sometimes starts from and sometimes reaches to the soul."

That was not a good start. It would have been better not to say that either the mind or the soul either pities or learns or thinks, or indeed that it does anything else. But the preferable alternative is to say that it is the person who pities or learns or thinks or what have you. For if you insist on saying that either the man or the woman—or even, politically correctly, the sexually indeterminate person—does this or that with his or her soul, then you may be tempted, especially in the prestigious context of a treatise on the soul, to construe your chosen idiom in an instrumental rather than an adverbial way. Yet, to read any Greek analogues of such phrases as "with my whole mind" as referring to the instrumentality of some personal portion of not-matter, instead of as referring to the manner in which some activity was performed, would be as grossly, as grotesquely, wrong as to look for a dog's lost temper or for a grin detached from a grinning face.

Aristotle's argument proceeds: "But intellect would seem to be developed in us as a self-existing substance and to be imperishable. For, if anything could destroy it, it would be the feebleness of old age. But, as things are, no doubt what occurs is the same as with the sense organs. If an aged man could procure an eye of the right sort, he would see just as well as a young man. Hence old age must be due to an affection or state not of the soul as such, but of that in which the soul resides, just as is the case in intoxication and disease. In like manner, then, thought and the exercise of knowledge are enfeebled through the loss of something else within but are themselves impassive."

This—as Wittgenstein so often said—is a terrible argument, just terrible. Of course old age, like intoxication and disease, afflicts some but only creatures of flesh and blood—specifically old people, drunks, and the sick. And maybe if the transplant surgeons could give some old person two young eyes, that person would see much better. Maybe, too, if the brains of the senile demented could be replaced by younger, more vigorous, and well-stocked substitutes, they would think better. But even granting all this, it simply does not begin to look like showing that intellect is "developed in us as a self-existing substance" that is "impassive" and hence "imperishable."

All in all, the correct conclusion seems to be that Aristotle's treatment of the possible separability and consequent immortality of the intellect was an aberration. Certainly any attempt to recruit these tentative probings to support what has been labeled "the logically unique expectation" has to be stopped short by noticing the abrupt contempt with which in the *Nicomachean Ethics* he inhibits any such immortal fears or longings: "Choice cannot have for its object impossibilities: if a man were to say he chose something impossible he would be thought a fool: but we can wish for things that are impossible, for instance immortality."

There was, during the late fifteenth and early sixteenth centuries, much discussion of both the interpretation of Aristotle and the substantive issue of the nature of the soul. It is said that in those days—days remarkably different from our own!—students often interrupted lectures with impatient cries of "What about the soul?" In the long and frequently furious controversies of that period, the effective last word was said by Pietro Pompenazzi—the Peter of Montua often hailed as "the last of the Schoolmen and the first of the Aristoteleans." Book 4 of his great polemic *De immortalitate animae* (On the Immortality of the Soul) concluded first, on his own account and on the substantive issue, that the soul, including the intellect, is in no way truly itself an individual. "And so it is truly a form beginning with and ceasing to be with the body, and then, second, and on the issue of interpretation, that any other view is totally un-Aristotelean."

Having said so much about the fundamental difficulty, indeed the sheer impossibility, of identifying a hypothesized individual incorporeal spirit as present at one particular time and in one particular place, it is now necessary to proceed to point out the further difficulty, indeed again the sheer impossibility, of reidentifying a spirit identified as present at a later time in the same or another place as the same spirit as had been identified as present at the earlier time.

It has sometimes been suggested that these hypothesized incorporeal spirits might be endowed with a capacity to remember their own past conscious experience, and thus reveal to themselves that they were at time two the same individual spirits as they had been at time one. The truly devastating objection to this suggestion is one which, by anyone tolerably familiar with the classical philosophical literature, is always credited to Joseph Butler. Bishop Butler—he held the senior English see of Durham—wrote: "And one should really think it self-evident, that consciousness of personal identity presupposes personal identity, and therefore

cannot constitute personal identity, any more than knowledge, in any other case, can constitute truth, which it presupposes." People just are, despite all the positive and negative implications, creatures of flesh and blood and bones.

In a nutshell the conclusion is that there will be no empirically meaningful doctrine of human immortality until and unless someone's incorporeal spirit has been shown to be identifiable at an earlier time, time one, and reidentified as the incorporeal spirit of the same individual person at a later time, time two.

ANTONY FLEW

INDIA, UNBELIEF IN. Introduction. Unbelief in religion has never been strong in India. In about the third century BCE materialist thought briefly prevailed under the names CARVAKA and Lokayata. Religious fundamentalists soon suppressed the Carvaka movement and destroyed most of its writings. During subsequent periods Buddhist philosophies held sway (see BUDDHISM, UNBELIEF WITHIN), but these endured only as long as they enjoyed the favor of local rulers. Eventually Buddhism became nearly extinct in India even as it transformed into a religion and spread to other parts of Asia.

Centuries passed before India saw new agitation toward organized unbelief. When the opportunity arose, it was a consequence of Great Britain's occupation and subsequent rule of India. A small number of Indians who had traveled abroad brought back Western ideas about the Renaissance, the Industrial Revolution, and the scientific worldview.

Throughout the nineteenth century there were nearly continual efforts at religious reform, but most were unsuccessful in bringing about radical or deep-rooted social change. Harmful institutions such as India's strong caste system, untouchability, the practice of *Sati* (burning the widow alive on her husband's pyre), and a demoralizing conviction regarding Karma or irresistible fate were rooted directly in ancient Hindu scriptures. While some nineteenth-century reform movements—including the Arya Samaj, Brahmo Samaj, Prarthana Samaj, and even THEOSOPHY in its reformist aspects—brought about some social change, their impact was short lived because none of them questioned the prevailing belief system in a fundamental way. So long as no reform movement dared to confront messages of India's so-called holy scriptures, the social evils opposed by reformers would always endure in some form, enjoying popular support on the false grounds that they embodied India's tradition and heritage.

Indian Unbelief in the Early to Mid-Twentieth Century. Only with the beginning of the twentieth century did a more resilient and dynamic form of unbelief emerge. Not surprisingly, it arose in southern India, a region then at the forefront of efforts to force drastic changes in India's social structure.

E. V. Ramaswami, better known as PERIYAR, launched an anti-Brahmin movement in what is now the state of Tamil Nadu in 1925; Tripuraneni Ramaswami (no relation) simultaneously launched a similar movement in Andhra Pradesh. Periyar and Ramaswami independently published literature in Tamil and Telugu, spreading iconoclastic ideas in opposition to long-established oppression by upper-caste Brahmins. By publishing in local languages, the two activists challenged the supremacy of the Sanskrit language, whose privileged status as the official language of the scriptures and the priesthood helped perpetuate social differentiation. In addition Periyar and Ramaswami urged the replacement of Brahmin priests with non-Brahmins.

Never mincing words, Periyar and Ramaswami used strong language to express their atheistic ideas and to challenge prevailing Hindu rituals, taboos, and customs such as child marriages. Ramaswami organized charitable institutions, including nursing homes to aid the downtrodden. Periyar and Ramaswami challenged Hindu holy scriptures and organized training camps that introduced a small number of middle-class people to the rational outlook. They performed intercaste marriages, which raised eyebrows in the early twentieth century. Ramaswami organized sensational processions against the Hindu god Rama in which he would strike a poster-sized image of Rama with shoes, a supreme gesture of disrespect. Ramaswami moved the masses with his speeches and organized rallies that attracted large crowds.

This movement had deep influence among the state's intelligentsia. S. Ramanathan, a prominent politician and a minister in Tamil Nadu's government, carried Periyar's mantle until the early 1980s. Periyar's Dravida Khazagam (Self-Respect) movement attracted charismatic leaders such as Annadurai Conjeevaram Nataraja and Karunanidhi Muthuvel, both of whom would later become chief ministers of the state. But they ended up by taking the organization into politics, effectively ending the movement Periyar had begun.

Other second-generation leaders stayed closer to the rationalist vision. Veeramani tried to continue the Dravida Khazagam movement and later joined India's humanist movement (see HUMANISM). Others, such as Ravipudi Venkatadri, carried the rationalist flame in Andhra Pradesh.

One of the shining lights of southern India's unbelief movement was GORA, or Goparaju Ramachandrarao. Gora was a Brahmin who stood against Brahmin supremacy, for which he was excommunicated from the caste. He hailed from Andhra Pradesh and was closely associated with Mohandas K. Gandhi in the freedom fight against the British.

Gora never compromised on the principles of ATHEISM, including resistance to the caste system. In 1940 he famously moved into the hamlet of Mudunur, a village for untouchables only, and lived among them. His wife, Saraswathi, also from an orthodox Brahmin

family, soon became actively involved. Together they led the atheist movement.

Also in 1940, Gora established the Atheist Centre in Vijayawada, a coastal town in Andhra Pradesh, from which he spread his ideas through magazines, literature, and meetings. Gora toured many countries of the world and contacted world atheist leaders such as Madalyn Murray O'Hair. To make a point, Gora organized beef and pork dinners targeting both Hindus and Muslims, who respectively considered those meats sacred or unclean. Gora championed democracy without political parties, simple living, and the spread of a positive atheism centered upon ethical living. His family continues promoting his ideas: his sons, Lavanam, Vijayam, and Samaram; his daughter, Chennupati Vidya; his daughter-in-law, Hemalatha; and his grandson, Vikas Gora.

Gora officiated at several intercaste and interreligious marriages; also, his daughter and one of his sons married untouchables, practicing by example what their father preached. The Atheist Centre established by Gora and managed by his family is known for its trailblazing activity throughout India, and admired in rationalist circles worldwide.

Andhra Pradesh's atheist movement spawned several splinter groups, several of which publish their own magazines and literature. Jayagopal, Katti Padmarao, B. Sambasivarao, Ramakrishna, Gutta Radhakrishna Murthy, Saraiah, M. Subbarao, I. Muralidhar, C. L. N. Gandhi, Siddarth Baksh, M. Basavapunnarao, M. Sharif, Pasala Bhimanna, Vikram, and others continue to fly the flag of atheism, however small or localized their efforts might be.

Other southern and western Indian states, including Kerala, Karnataka, and Maharastra, also saw an early twentieth-century surge in rationalist activity. Abraham Kovoor, originally of Kerala, electrified the skeptics' movement with his speeches and demonstrations, touring several states in India as well as Sri Lanka, where he settled. His books debunking astrologers and wonder-working "god-men" remain popular today. Another active rationalist in Kerala is Govindan, who edits the magazine *Sameeksha.* The father-and-son duo of Joseph and Sanal Edamaruku was also instrumental in challenging god-men and exposing fraudulent "miracles." They toured extensively to demonstrate the falsehood of miracle claims that figure so prominently in rural Indian life. In 1980 Sanal Edamaruku moved to Delhi, where he launched an international rationalist organization with a Web site, journals, books, and an active campaign.

In 1954–55 B. R. Ambedkar led a large campaign in Maharastra state to convert Hindus into Buddhists so that they could discard inequality, end caste, and attain human rights with dignity. Unfortunately this movement met with little success.

Skeptics groups focused on science and the critical examination of paranormal and supernatural claims began working in states including West Bengal, Orissa, Bihar, Punjab, Gujarat, Andhra Pradesh, Karnataka, Maharashtra, and Tamil Nadu. Master magician and debunker B. Premanand arranged a federation of these groups and conducted several meetings at the national level. Premenand personally instructed several activists in magic for the purpose of exposing fraudulent faith healers and god-men and -women. In Andhra Pradesh the Federation of Atheist, Rationalist, and Humanist Associations (FARAH), a state-level federation of skeptical groups, campaigned against fraudulent claims involving god-men, alternative medicine, and the supernatural under its coordinator, Innaiah Narisetti.

The Rationalist Association was launched in Mumbai (then Bombay) during the 1930s and slowly gained momentum. Among its active participants and advocates were Abraham Solomon, Lokhandawala, M. N. Roy, M. V. Ramamurhty, R.Venkatadri, Avula Gopalakrishna Murthy, and Innaiah Narisetti.

M. N. Roy was distinctive in that he promoted a particularly philosophical and scientific outlook among unbelievers across India. In the 1940s he organized camps for intellectuals, teachers, youths, and activists. There he taught them the scientific method and methods of applying it to study politics, economics, and social problems. This was a unique experiment among whose several hundred participants were future humanist leaders including V. M. Tarkunde and Indumati Parikh. Roy also established radical humanist, renaissance, and rationalist organizations at the national and international levels. Often he challenged the Gandhian spiritual ideology prevalent among Indian intellectuals.

Unbelief in Independent India. Despite its impact among the intelligentsia, unbelief had limited impact on India at the policy level. As the first prime minister of an independent India, Jawaharlal Nehru established a secular framework for the country, but he was forced to compromise his secularism on several occasions due to religious and political pressures. In particular he had to give up on the idea of a uniform civil code applicable to all Indians, instead allowing the various religious communities to regulate marriage, divorce, inheritance, and other family law issues in accord with their religions. Today the Congress Party, which is by far the most liberal and secular in its stated outlook, continues to make compromises with all religious groups. The BJP, a Hindu fundamentalist party recently in power, sharply reversed trends toward greater rationalism in public life and education. Meanwhile, communist parties won power in three states—in Kerala during the 1960s, in West Bengal during the 1970s, and twice in Tripura during the 1970s and 1980s—in each case raising hopes of greater rationalism and commitment to a scientific thought. Instead, communists repeatedly compromised with popular religious sentiment and never encouraged the efforts of rationalists, humanists, or skeptics. For example, communist leaders continue to encourage popular religious festivals such as West Bengal's Durga Puja and Kerala's Ayyappa

festival in order to attract pilgrims, tourist revenue, and voter support. The Marxian principle that "[r]eligion is the opium of the people" has been little recognized whenever India's communists have held regional power.

After the death of M. N. Roy in 1955, several intellectuals carried on his spirit of inquiry through study camps, training classes, publications, seminars, and magazines. They diversified the activism of Roy's movement into such fields as human rights (V. M. Tarkunde), equality of women (Indumati Parikh, Malladi Subbamma, and Gauri Malik), publications (Shib Narayan Ray, Prem Nath Bazaz, Philip Sprat, Ram Singh, R. M. Pal, R. L. Nigam, C. R. M. Rao, Balraj Puri, and Niranjan Dhar, author of *Vedanta and Bengal Renaissance*), civil liberties (N. D. Pancholi, C. T. Daru, Jayant Patel), international organizations (G. R. R. Babu), and secularizing activities (Avula Gopalakrishna Murthy).

V. B. Karnik and Maniben Kara concentrated their efforts among the labor and humanist movements. A. B. Shah founded the Indian Secular Society and tried to educate Muslims with the help of Hamid Dalwai. He also established Satya Shodak Mandal (Search for Truth) in hopes of bringing Muslim youth into the mainstream of secular society. His book *Muslim Politics* provoked much discussion. Shah enraged Hindus by questioning the ban on killing cows, but he is best known for championing the scientific method as a solution to India's problems. His book *Scientific Method* achieved a rare breakthrough into Indian academe when it was accepted as a textbook by Bangalore University during the vice chancellorship of outspoken activist H. Narasimhaiah. Shah launched several publications, including the magazines *Humanist Review*, *New Quest*, and the *Secularist*, as well as educational reform campaigns advocating humanism and secularism.

Unbelief in the Late Twentieth Century. Much of the effort to promote unbelief in India has become a regional effort marked by pockets of resistance to the country's fundamentalism and continued distaste for scientific thinking.

In West Bengal, for instance, local humanists and rationalists Prafulla Kumar, Manoj Dutta, Samaren Roy, and Sushil Mukherjee have questioned the claims of miracles attributed to the late Mother Teresa. In Andhra Pradesh and Kerala, the focus of activism has been against god-men and god-women who claim to perform miracle cures. In Andhra Pradesh, rationalists opposed the unscientific alternative medicine of homeopathy; exposed the psychic surgery claims of Alex Orbito; and campaigned against the swallowing of live fish for asthma cures, the hugging of regional holy woman Matha Amrithananda Mayi in order to obtain prosperity, and *Vaastu*, the Indian form of geomancy or feng shui.

Rationalist groups have published several well-documented books about fraudulent god-men such as Satha Sai Baba (*Murders in Sai Baba Ashram* by Premanand) and Jillellamudi Amma (by M. V. Ramamurthy). Other well-received titles include N. V. Brahmam's *The Truth about the Bible*, R. Venkatadri's *The Falsehood of Geomancy*, N. Innaiah's *Lie Hunting*, Narasimhaiah's *The Unscientific Nature of Astrology*, Ramendra's *Why I Am Not a Hindu*, Justice R. A. Jahagirdar's *Secularism Revised*, and Abraham Kovoor's *Be Gone Godmen*. Books exposing the holy scriptures include Laxman Sastri Joshi's *Critique of Hinduism*, V. R. Narla's *The Truth about the Gita*, Premnath Bazaz's *Gita*, P. H. Gupta's *Critique on Ramayana*, and Agehananda Bharati's *Ochre Robe*. The writings of Kushwant Singh also helped to spread the skeptical viewpoint.

Basava Premanand, Sanal Edamaruku, Innaiah Narisetti, Ramanamurthy, and G. R. R. Babu continue to question the authenticity of holy persons and have taken their message to an international level, drawing considerable media attention to Indian affairs. *Charvaka*, a Vijayawada-based magazine in Telugu edited by Thotakura Venkateswarlu, had great impact on Indian youth in early 1970s.

Increasingly, humanist, skeptical, and rationalist groups received support from Indians living abroad, people such as Aramalla Purnachandra, Nirmal Mishra, and Jyothi Sankar.

Despite activists' best efforts, miracle cures and other dubious religious and paranormal claims continue to draw thousands of believers, many of whom are enticed into making large financial contributions in the hope of restoring health or achieving some supernatural reward.

Unbelief in the Twenty-first Century. India entered the twenty-first century having failed to achieve the scientific society of which the past century's secularizing reformers dreamed. While small groups in various Indian states continue the fight against fundamentalism and traditional practices that affront human rights, India's skeptical, rationalist, secularist, atheist, and humanist groups face an uphill struggle toward their goal of modernizing Indian society.

Functioning in various regions are the Indian Secular Society, whose journal, the *Secularist*, is edited by V. K. Sinha; the Indian Radical Humanist Association, led by Sangeeta Mall, the managing editor of the *Radical Humanist*; the Indian Humanist Union, led by Prakash Narain; the Bihar Buddhiwadi Samaj, led by Ramendra; the Satya Shodhak Sabha in Surat and Babubhai Desai in Gujarat; the Andha Viswas Nirmula, an antisuperstition organization based in Maharastra and led by Narendra Dhabolkar; a humanist group in Rajastan led by Mohanot Ugamraji; rationalist groups led by Srini Pattathanam and T. Oomen; the Manavata Vadi Viswa Samstha in Haryana, led by the activist Manavatavadi; the Indian Skeptic Society (FIRA) in Mangalore, led by Narendra Naik; and Subhankar, a humanist group in West Bengal. Each of these organizations has a small membership; taken together, they comprise an almost insignificant minority among India's more than one billion people. But they continue to express their views and

raise their voices, often making clever use of local media to fight back against the power of tradition, religious fundamentalism, and dogmatic thinking.

Over time, India's humanist, rationalist, atheist,' and skeptical organizations in India have established numerous connections with like-minded foreign and international organizations. Several international atheist, humanist, and skeptical conferences have been organized in India and attended by leading foreign experts and thinkers. Organizations important in this regard include the INTERNATIONAL HUMANIST AND ETHICAL UNION, the Center for Inquiry, the Committee for the Scientific Investigation of Claims of the Paranormal, and the humanist and rationalist associations of various Western countries. At the same time, key Indian leaders have participated in numerous overseas conferences and congresses. Also important has been the translation of key books and articles by Indian and international authors into India's myriad languages. Skeptics in India have also benefited greatly from the populist writings of James Randi, who offers a $1 million challenge for scientific verification of any paranormal claim. Despite repeated offers of this challenge to Indian god-men, none has yet come forward to perform "wonders" under controlled conditions.

INDIAN MATERIALISM, ANCIENT. India has an ancient tradition of RATIONALISM, FREETHOUGHT, and ATHEISM whose roots extend deeper than recorded history. Materialism (see MATERIALISM, PHILOSOPHICAL) is the basic concept that underlies ancient atheism. It is as ancient as Indian philosophy itself, and deeply rooted in speculative philosophy. According to Hindu tradition, an atheist is not just one who denies the existence of god but also one who defies the authority of the Vedas (scriptures).

Samkhya, an early system of rationalistic philosophy, had its roots in pure philosophic speculation concerning *prakruti*, a complex primal substance, and *purusha*, a sentient principle that was held to have disturbed *prakruti*, thus triggering the evolution of the contemporary universe. This process was described without any reference to *iswara*, that is, God. Kapila, revered as the founder of Indian philosophy (c. 800 BCE), is considered the founder of *Samkhya* (sometimes termed *Nireswara Samkhya*—"Nireswara" meaning "godless.") *Samkhya* proceeds from the ideas of *swabhava* (physical reality, or the laws of nature) and *parinama* (an active principle best summarized as "evolution").The *Samkhya* system was originally atheistic, but over generations theists succeeded in smuggling God into it, presented as a supreme spirit ruling over both *prakruti* and *purusha*.

The followers of the *Mimamsa* school—which had established the authority of the Vedas (classical Hindu scriptures)—set such stock by Vedic ritual that they felt no need for a god. They believed that merely chanting mantras would produce certain effects directly. So for them the *devas*, or nature spirits described in the Vedas, had only verbal significance and did not actually exist. The *Nyaya* school, believed founded by Gautama (variously dated between the third century BCE and the first century CE), was also rationalistic, stressing above all rigorous logic in argumentation. The philosopher Kanada (dates unknown), who founded the rationalistic *Vaiseshika* school, believed in the existence of atoms. But the later advocates of the *Nyaya* and *Vaiseshika* systems imported God into them, rendering them theistic.

The *Carvaka* and *Lokayata* schools of philosophy (see CARVAKA) also flatly denied the existence of gods and belittled God's importance in shaping human affairs. The Lokayata system, which believed only in the four classical elements and the world of experience, is considered the foremost materialistic philosophy of ancient India. Krishna Mishra, a contemporary of Gautama Buddha, summarized *Lokayata Darshana* (Lokoyata teaching) in these words: "only perceptual evidence is authority. The elements are earth, water, fire and air. Matter can think. There is no other world. Death is the end of all."

The Jaina and Buddhist schools of thought developed around 500 BCE, independently of the Vedic tradition. Their greatest exponents, the Jaina commentator Gunaratna and his Buddhist counterpart Santarakshita (both c. fourteenth century CE), put forward convincing arguments against the existence of any god.

Thus ancient India is not only a cradle land of religion, but also of atheism. History demonstrates there unbelievers were numerous in ancient India, even in the times during which the Upanishads were compiled. Long before the advent of the Buddha, there were atheists known as *Nasthiks* (no-sayers) or *sangaya* (nihilists or agnostics). Revered philosophers including Purana Kashyapa, Maskarin Gosala, and Ajia Kasakamblin were unbelievers. Even that central Hindu epic, the *Ramayana*, depicts Satyakama Jabali—a teacher of humble birth who was openly skeptical about the existence of God. The later Upanishads and the oldest Buddhist books alike name numerous heretics who denied the existence of God; the Hindu sage Brihaspathi was an icon of this school of thought. The previously mentioned Caravakas and Lokayatas condemned superstitions and Hindu orthodoxy. They challenged the concept of rebirth, the idea of the soul, and diverse religious practices. These ancient atheists challenged the authority of the Vedas and the Upanishads. They spread the *Nasthika* movement far and wide, challenging the supremacy of the Brahmins whose prestige rested in part on those scriptures.

The Jain teacher Mahavira and the Buddha also advo-

cated unbelief, though in a refined manner. Buddha's teachings essentially made god unnecessary; he claimed "enlightenment" but never inspiration, and never pretended that a god was speaking through him. He founded Buddhism without making any reference to God. The positive materialistic content of Buddhism was very popular in India for nearly a thousand years.

Unlike Jainism and Buddhism the *Nireswara Samkhya*, Caravaka, and Lokayata schools never enjoyed royal patronage. They were simply rationalistic, materialistic, and atheistic. Their followers were vilified, excommunicated, and hounded out. The legendary Indian lawgiver Manu is said to have given an injunction (c. 1500 BCE) that a *nasthika* (atheist) should be driven out of good society. Over the centuries, this dictate was frequently obeyed. The manuscripts of the early atheistic thinkers were destroyed. For example, the Carvaka school died out shortly after 1400 CE; its principal works survive only as fragments cited in the works of Hindu and Buddhist opponents. But even those fragments reveal that the early atheists were bold freethinkers. Theists could not ignore them, as atheistic freethought enjoyed strong support, and its ideas had to be taken seriously and faced rigorously.

Atheism had strong roots in traditional Indian wisdom. According to Debiprasad Chattopadhyaya, the leading researcher on ancient Indian atheism, the overwhelming majority of the accredited exponents of major philosophical views were committed atheists. He reiterates: "[T]hey were not simply indifferent to the question of God, as some of the early Greek philosophers perhaps were. The Indian philosophers, on the contrary, faced the problem of God with all the seriousness they were capable of and they reached the reasoned conviction that His existence could be admitted only at the cost of clear logic. Such a situation is really unique. It has hardly any parallel in the history of world-philosophy."

Traditional Indian atheism is, then, truly ancient. It represented an extensive area of clear agreement among the traditional Indian philosophers. In spite of their commitment to atheism, these philosophers represented diverse worldviews; thus atheism in India had to develop with a peculiar self-sufficiency all its own. Philosophers had to defend atheism as such, without allowing its admixture with their other preoccupations. For the Lokayatas, atheism formed part of a clear and consistent materialistic outlook. They denied god in order to make room for the doctrine of the exclusive reality of the material elements. It was more or less true, as well, in the case of *Sankhya* philosophers.

Ancient Indian philosophers did their best to prove that, logically speaking, God was only an illusion; and they were greatly successful in their efforts. Theism and atheism represented for them clear-cut and diametrically opposed philosophical positions. They concluded firmly that God is a simple superstition, an empty assumption, and an object of misdirected reverence.

Let us close with the words of Debiprasad Chattopadhyaya, who, summing up the status of God in Indian philosophy, declared, "Of all our major philosophies, only the Vedanta (with some reservation) and specifically the later version of the *Nyaya-vaisesika* were theistic. By contrast, Buddhism, Jainism, Purva-mimamsa, Samkhya, Lokayata and Nyaya-vaisesika in its original form were philosophies of committed atheism. Thus, the stupendous importance of atheism in Indian wisdom can be questioned only by disallowing the largest majority of the significant Indian philosophers representing it."

INDONESIA AND SOME OTHER ISLAMIC COUNTRIES, UNBELIEF IN. Indonesia: An Overview. In 2000 Indonesia had a population of 212 million. Its official religion has been described as monotheism. The national ideology, *Pancasila* (Five Principles), presupposes the existence of one supreme God. As of 1999, religious affiliation was distributed as follows: Muslim, 83 percent; Protestant, 9 percent; Roman Catholic, 4 percent; Hindu, 2 percent; Buddhist, 1 percent; and other (comprising religious persons and atheists), 1 percent. As these figures indicate, Indonesia is a predominantly Islamic society. Religious people other than the Muslims are found mostly in cities and in some eastern parts of the country. Indonesia is the world's most populous Islamic country. Religious fanaticism is not common among Indonesians, but for decades strong tensions have existed between Christians and Muslims, resulting in occasional clashes.

As regards freedom of religion, the situation in Indonesia is complex. After several centuries as a Dutch colony, Indonesia became independent in 1949. Its first president was Sukarno, who was extremely popular. In 1966 General Suharto became the second president; he ruled until May 1998. During this period Indonesia had five recognized religions: Islam, Roman Catholicism, Protestantism, Hinduism, and Buddhism. People were encouraged or forced to join one of these religions, and discouraged or disallowed from joining other religions. Thus ATHEISM, SECULAR HUMANISM, and irreligion were possible only in private.

Atheism has often been confused with Communism in Indonesia. Communism was allowed as a political option from 1945 until October 1965, but from October

1965 until the end of the Suharto regime in May 1998, Communists were harshly persecuted.

Indonesia Compared with Some Other Islamic countries. According to the *World Christian Encyclopedia*, in 1995, 2.1 percent of the Indonesian population consisted of secularists, that is, either atheists or the nonreligious. In 1980 the corresponding figure was 1.6 percent; in 1900, 0 percent. According to the same source, Islamic countries never incorporated into the Soviet Union generally have low percentages of secularists. In 1980 Jordan had the highest percentage of secularists (2 percent) among seventeen such Islamic countries. By 1995 Algeria was the Islamic country with the highest percentage of secularists (3 percent), followed by Syria (2.9 percent), Indonesia and Turkey (2.1 percent each), Jordan (1.9 percent), Sudan (1.1 percent), and Morocco (1 percent). In the other Islamic countries never incorporated into the Soviet Union, secularists made up less than 1 percent of the population.

Islamic countries that have been a part of the Soviet Union and therefore touched by aggressive atheism (see PROPAGANDA, ANTIRELIGIOUS [SOVIET]) have higher levels of secularism (atheism or agnosticism). The *World Christian Encyclopedia* reports that in 1995 Azerbaijan contained 11.7 percent secularists; Kazakhstan (with a partly Christian background), 43 percent secularists; Kirghizia, 29.6 percent secularists; Tajikistan, 15 percent secularists; Turkmenistan, 11.7 percent secularists; and Uzbekistan, 23.2 percent secularists. In sum, in those Islamic countries once part of the Soviet Union, no less than 11.7 percent of any country's population was made up of secularists. Because this rate is so much higher than is seen in Islamic countries never a part of the Soviet Union, it may be assumed that the heightened level of secularism seen in formerly Soviet Islamic countries is at least partly due to the influence of Soviet atheism.

Albania. The Muslim parts of the Soviet Union are not the only areas of the world in which Islam and other religions underwent fierce attacks in the twentieth century. In Albania both Christians and Muslims were subjected to harsh persecutions by Albanian communists under the leadership of Enver Hoxha from 1944 on. In 1967 all churches and mosques were closed and Albanians were forbidden to possess religious literature. After 1990, when the communist regime broke down, efforts were made to introduce religious and political freedom in Albania.

Turning again to the *World Christian Encyclopedia*, we find the following snapshots of religious affiliation in Albania at the beginning and near the end of the twentieth century:

Muslims	1900	68.5%	1995	36.3%
Christians	1900	31.3%	1995	33.4%
Nonreligious	1900	0.1%	1995	20.2%
Atheists	1900	0%	1995	10.1%

Presumably, between 1944 and 1995 Islam had been sharply weakened—although to the degree these figures are reliable, in 1995 Islam remained the largest religious community in Albania. Yet by that year Christianity was only marginally weaker than Islam. The true novelty in the 1995 figures is an almost entirely new secularist group, comprising 30.3 percent of the population. This means that in 1995 the religious landscape in Albania was almost evenly divided among Muslims, Christians, and secularists.

Atheism in the Islamic World. Explicit atheism remains rare in the Islamic world. This seems to be the case even in some of the Islamic countries exposed to Soviet atheism. Though Soviet atheism was aggressive, it was able to eradicate religious beliefs only to a limited extent in its areas of influence. Some fifty countries around the world have majority Muslim populations. Few scholars appear to have explored the phenomenon of atheism in Islamic countries, to the degree it exists.

Marxism and Communism in Indonesia. In the twentieth century MARXISM and communism were powerful vehicles for the spread of atheism. Marxism comprises the ideas advocated by Karl MARX, Friedrich Engels, Vladimir I. LENIN, and other thinkers and activists. Communism, of which several forms exist, was often a radical and intransigent kind of political Marxism.

Marxism was the first atheistic philosophy presented to parts of the Indonesian population in any systematic way. In fact it has been the only atheistic philosophy to wield significant influence in Indonesia, even if often in distorted or watered-down versions.

Marxism was first brought to Indonesia by Dutchmen. Hendricus Sneevliet disembarked at Semarang, Java, in 1913, and a year later started a socialist club in Surabaya. Sneevliet's eagerness to propagate socialism was frustrated by other members of the club, who preferred for it to function only as a study group. Another socialist group was established by Adolf Baars in Surabaya in 1917. Both this group and the earlier group founded by Sneevliet were able to attract some Indonesian members.

More important for Marxism than these early Dutch-founded groups was the Sarekat Islam, founded in 1911 as a society of Muslim merchants. Its aim was to offer Javanese and Arab traders protection against encroachments by Chinese traders. Although Sarekat Islam was a Muslim organization, some of its members were Muslims in name only; some were influenced by Marxist thought. In 1920, Marxists established what later came to be the Indonesian Communist Party (PKI). The most important of these early communists were Semaun, Alimin Prawirodirjo, Musso, Darsono, and Tan Malaka. Of these, Tan Malaka is ordinarily considered the most important theorist. Darsono, too, reportedly made a serious study of Marxism.

Early Indonesian communists were not antireligious; to the contrary, they were cautious in their public stance toward religion. Most were nominal Muslims, only too aware of Islam's importance in Indonesia. Little is known regarding their personal religious views.

Although opponents constantly stressed the atheism of Indonesian communists, Indonesian communists rarely propagated atheism. On the road to Indonesia, the thought of Marx, Engels, and Lenin was in practice deprived of explicit atheism. Where atheism was not avoided outright, it was never emphasized. In Indonesia religion remained broadly popular, and atheism did not serve the purposes of the left. Atheism as an ideology was quite foreign to a large part of the Indonesian population.

Later Communism in Indonesia. The earliest phase of communism in Indonesia was short lived, being suppressed in 1927. In this early period the Indonesian Communist Party never had more than three thousand members. Probably only a fraction of these were atheists or agnostics. A new and more auspicious period for Indonesian communism began in 1951, ending in a catastrophe of historic dimensions in 1965–66. The leader and main theorist during this period was Aidit. Available biographical information says nothing about his personal religious beliefs, if any.

Some leading communists from this period were presumably atheists, including Lukman, Nyoto, Sudisman, and Nyono. On the whole, very little is known about their personal religious views. Most were nominally Muslim, whereas some were nominal Christians or without known religion. Among leading socialists, a few had privately declared themselves to be atheists, though they did not admit it in public. In fact, no well-known twentieth-century Indonesian offered a public statement of his atheism, if he was an atheist. Atheism was always a private view.

Indonesian communists ordinarily presented themselves as nationalistic, as being opposed to the use of violence in the pursuit of political objectives, as defenders of democracy, and as sympathetic to religion. In November 1954, communist leaders for the first time announced their adherence to Sukarno's *Pancasila* ideology, which included "belief in one God" as one of its tenets. Although communist leaders would later retract their positive commitment to *Pancasila*, *Pancasila* nonetheless became an element of Indonesian communist ideology, culminating in *Pancasila*'s inclusion in the Communist Party constitution in 1962.

Atheists in Islamic Countries. An interesting feature of the *World Christian Encyclopedia* is that it presents precise numbers of atheists for almost every country in the world—though it is not always clear how these figures were arrived at. For example, the *Encyclopedia* informs us that there are no known atheists in Vatican City. As to Islamic countries, the *Encyclopedia* lists the following atheist populations, as of 1995:

Afghanistan	400
Indonesia	460,000
Iran	7,600
Iraq	31,000
Libya	90
Mauritania	180
Saudi Arabia	4,400
Senegal	3,600
Syria	30,000
Tunisia	3,400
Turkey	62,000

It is difficult to gauge the accuracy of these numbers; it is also difficult to identify and contact atheists, even in Muslim countries that supposedly contain many of them. Across the Islamic world, as elsewhere, atheism has largely remained "invisible."

FINNGEIR HIORTH

INGERSOLL, ROBERT GREEN (1833–1899), American orator, secularist, agnostic, lawyer, and freethinker. In the course of a thirty-year speaking career, Robert Green Ingersoll—"the Great Agnostic"—was seen and heard by more Americans than any human being prior to the advent of motion pictures and radio. In his day the best-known representative of ATHEISM, AGNOSTICISM, SECULARISM, and FREETHOUGHT, he unfortunately built no organization to perpetuate his influence.

Early Life. Ingersoll was born on August 11, 1833, the third and youngest child of John and Mary Livingston Ingersoll. His birthplace, a modest two-story frame house in Dresden, New York, has been fully restored and now greets the public as America's only freethought museum (see SHRINES AND MONUMENTS TO UNBELIEF). Ingersoll's father was an itinerant Presbyterian minister who was said to have but two sermons to give. The first was on abolitionism, then a contentious minority position even in the North; the second concerned hell's temperature. Reverend Ingersoll changed congregations frequently.

Ingersoll's middle name reflects his parents' abolitionist sentiments; it honors the Congregational minister Beriah Green, who delivered the first series of abolitionist sermons preached in America at a small Ohio college. In the summer of 1833, Green journeyed east to assume the presidency of the Oneida Institute, a pioneering racially integrated boarding school near Utica,

New York. Green may have visited the Ingersolls enroute about a month before Robert's birth.

Characteristically, Reverend Ingersoll wore out his welcome at this church, leaving Dresden with his family when Robert was but four months old. Mary Ingersoll died at Cazenovia, New York, in 1835. Reverend Ingersoll and the children hopped from one church posting to another, following the frontier west. Ingersoll's formal education ended with high school. He was, however, a voracious reader and he possessed a photographic memory. He formed a passionate appreciation for the writings of William Shakespeare (see SHAKESPEARE, RELIGIOUS SKEPTICISM IN) and Robert Burns. Ingersoll became a lawyer by completing his "apprenticeship" at age twenty-six. He and his brother Ebon practiced law together in southern Illinois, later moving to Peoria. There, the prominent judge and freethinker Benjamin W. Parker, impressed with Ingersoll's histrionics in his courtroom, invited Ingersoll to his home for dinner. On that occasion Ingersoll met the judge's daughter, Eva Amelia Parker. It was love at first sight for both of them. They married in 1862 and would later have two daughters. Shortly after his wedding, Ingersoll raised a cavalry regiment, was commissioned a colonel, and went off to the Civil War. In its first battle, Ingersoll's 11th Illinois Cavalry was completely surrounded. He surrendered his entire command. Paroled and repatriated to Peoria, he resumed the practice of law. He achieved regional prominence as a speechmaker in support of the Union cause. In 1867 Ingersoll was appointed attorney general of Illinois, the only public office he would hold.

Emergence as a Public Speaker. Ingersoll's career as a public speaker and an open agnostic was prompted by Eva and her father. They urged him to use his oratorical skills to attack the evils of organized religion. He was unequivocal, unsparing, and unrelenting in his attacks on traditionalist Christianity and especially its doctrine of eternal punishment, which he considered uniquely pernicious.

Ingersoll delivered his first major lecture in 1869, his last in 1899, the year of his death. During those thirty years he toured the nation almost continuously, delivering six or seven lectures each week to sold-out houses. A ticket to hear Ingersoll cost fifty cents (about seven dollars in today's money), sometimes as high as a dollar; yet wherever he traveled he consistently outdrew area revivalists who preached for free. Ingersoll commanded a large repertoire of two-, three-, and four-hour orations, all delivered from memory. His rhetoric brimmed with wit, deep feeling, and poetic expression. Titles of his principal freethought orations include "The Gods," "Heretics and Heresies," "The Ghosts," "About the Holy Bible," and "Some Mistakes of Moses." His repertoire also included orations on literature, science, women's rights, and the political affairs of the day. His complete lectures and interviews would fill twelve volumes.

On several occasions Ingersoll applied his legal skills in the service of freethought. In 1887 he defended liberal religionist Charles B. REYNOLDS against charges of BLASPHEMY in Boonton, New Jersey. When Ingersoll lost the case, he waived his fee and even paid the defendant's fine! But so thoroughly had Ingersoll ridiculed the idea of blasphemy laws in a free society that no state brought another blasphemy prosecution; the Reynolds case stands to blasphemy law in much the same way that the Scopes trial stands to evolution (see EVOLUTION AND UNBELIEF).

In another famous freethought case, Ingersoll defended D. M. BENNETT, convicted under the infamous Comstock Act for having sent "obscene" literature through the US mails (see *TRUTH SEEKER, THE*; COMSTOCK, ANTHONY, AND UNBELIEF; SEX RADICALISM AND UNBELIEF; TILTON, JOSEPHINE). Bennett, a freethinker, had publicly opposed traditional religion through his national newspaper *The Truth Seeker*, and had previously tangled with agents of Comstock when arrested for selling a birth control tract at a freethought convention in Watkins Glen, New York. Ingersoll personally interceded with President Rutherford B. Hayes, but failed to secure a pardon for Bennett in a case whose verdict would supply the legal definition of obscenity that ruled American law for about three-quarters of a century.

Political Oratory. Despite his agnosticism—and despite the fact that none of the successful political candidates for whom he campaigned dared appoint him to public office—Ingersoll was the foremost speechmaker of the post–Civil War Republican Party. (It should be remembered that the GOP was then the party of Abraham Lincoln, having taken a stronger line than the Democrats against the Southern secession and slavery.) Ingersoll's career as a political speaker of national stature began in June 1876, when the Republican National Convention was held in Cincinnati. Ingersoll agreed to nominate Maine senator James G. Blaine for president. When Ingersoll was introduced, the applause was so great that ten minutes elapsed before he could begin his remarks. Praising Blaine in florid, poetic language, Ingersoll described his nominee as a "plumed knight." Blaine would be known ever after as the Plumed Knight, and Ingersoll's "Plumed Knight" speech would be reprinted and studied as an exemplar of political rhetoric for decades. As it happened, the convention nominated not Blaine, but Hayes—for whom Ingersoll campaigned, and who won the White House. Indeed, during Ingersoll's public life every Republican presidential candidate for whom he campaigned, from Grant to McKinley, was elected; the sole GOP candidate for whom he refused to campaign—ironically, James G. Blaine—failed to attain the White House.

Also in 1876 Ingersoll gave a sentimental Decoration Day speech in Indianapolis about the sufferings of Union soldiers and their families in the Civil War. An evocative excerpt was widely reprinted as "A Vision of War." Contemporaries regarded it as the noblest statement on the war, save only Lincoln's Gettysburg Address. Ingersoll

became a sought-after Decoration Day speaker and often addressed units of the Grand Army of the Republic, the Civil War veterans' group.

Combining his roles as GOP campaign firebrand and bard of the Union veterans, Ingersoll is said to have invented "waving the bloody shirt"—a Republican campaign technique that centered on tarring Democratic candidates as former supporters of slavery and Southern secession who bear personal responsibility for the innumerable scars borne by the nation during war.

High Points of Ingersoll's Oratorical Career. On October 20, 1876, months after his "Vision of War" and "Plumed Knight" speeches, a crowd estimated to exceed fifty thousand gathered at Chicago—*indoors*—to hear Ingersoll speak. The venue was the Interstate Industrial Arts Exposition Building. Designed by W. W. Boyington, whose Chicago Water Tower still stands, the "Expo" was a giant web of steel and glass panels, nine hundred feet long and two hundred feet wide, its interior unobstructed by supporting columns. It occupied the site where the Chicago Art Institute stands today. Ingersoll would speak on behalf of the Republican candidate for president, Rutherford B. Hayes. People began to fill the cavernous building two full hours before Ingersoll was to speak—of course, without benefit of any public address system. Such was Ingersoll's reputation that more than fifty thousand people would crowd together knowing that most of them could only *hope* to hear his voice.

On January 25, 1893, Ingersoll gave the dedicatory remarks for a new theater in tiny Dowagiac, Michigan. The town's economy was sustained by the Round Oak Stove Company, founded by millionaire atheist and one-time Dowagiac mayor Philo D. Beckwith. Beckwith had dreamed of building a theater and bringing culture to Dowagiac. Following his sudden death, his wife and children had fulfilled his dream by building the splendid Beckwith Theater as his memorial. Its exterior was decorated with large stone medallions carved in the likenesses of persons Beckwith had admired, such as VOLTAIRE and Thomas PAINE. Six of the medallions depicted women, among them the suffragist Susan B. Anthony (see WOMAN SUFFRAGE MOVEMENT AND UNBELIEF). One of the medallions depicted Ingersoll. It now rests in the Ingersoll Birthplace Museum in Dresden.

On the evening that Ingersoll dedicated the new facility, a New York theater critic who happened to be present wrote, "The Beckwith is the finest theater in America." In future years the Beckwith would host such national-level performers as actress-singer Lillian Russell and "march king" John Philip Sousa. The theater was demolished in 1968. But January 25, 1893, was the night of the theater's dedication. Ingersoll gave a rousing memorial tribute to Philo Beckwith followed by a three-hour lecture on Shakespeare. The next evening Ingersoll delivered a three-hour lecture on Robert Burns in Chicago. To deliver two such lectures plus the memorial tribute in a space of twenty-four hours, all without notes, suggests the scope of Ingersoll's extraordinary gifts.

Ingersoll also became a sought-after provider of eulogies, speaking at the gravesides of Walt WHITMAN and Henry Ward Beecher, among many others.

Ingersoll on Religion. Was Ingersoll an atheist or an agnostic? On one occasion, Ingersoll observed that "an agnostic is an atheist, an atheist is an agnostic"—thoughtful people wearing either label know that they lack any knowledge that a god exists. Ultimately, whether one labels Ingersoll atheist or agnostic *is secondary to his identity as a secularist.* Ingersoll's secularism became the basis for his affirmative philosophy of living. He was a man of substantial beliefs—beliefs devoid of supernatural content but rather having profoundly to do with justice, REASON, the Enlightenment (see ENLIGHTENMENT, UNBELIEF DURING THE), and the fruits of science.

Ingersoll's own definition of secularism spells out the essence of his worldview, excerpted from a much longer definition that he gave extemporaneously in response to a reporter's question:

> Secularism is the religion of humanity. It embraces the affairs of this world. It is interested in everything that touches the welfare of a sentient being; it advocates attention to the planet on which we happen to live; it means that each individual counts for something; it is a declaration of intellectual independence, it means the pew is superior to the pulpit, that those who bear the burdens shall have the profits and they who fill the purse shall hold the strings. It is a protest against being the serf, subject or slave of any phantom or of the priest of any phantom. It is a protest against wasting this life for the sake of one we know not of. It proposes to let the gods take care of themselves. . . . It is living for ourselves and each other, for the present instead of the past, for this world in instead of another. . . . It is striving to do away with violence and vice, ignorance, poverty and disease. . . .
>
> It does not believe in praying and receiving but in earning and deserving. . . . It says to the whole world, Work that you may eat, drink and be clothed; work that you may enjoy; work that you may not want; work that you may give and never need.

Early in his public speaking career, Ingersoll would occasionally debate clergymen. He gave it up, declaring, "Debating the clergy is like giving medicine to the dead."

Ingersoll spoke for social justice and equality of opportunity, and against racism, anti-Semitism, sexism, and the abuse of children. He proclaimed that suicide was not a sin. Far ahead of his time, he called for an international court of justice to adjudicate disputes between nations. He proclaimed: "While I am opposed to all orthodox creeds, I have a creed of my own, and my

creed is this. Reason is the only torch; justice the only worship, humanity the only religion, love the only priest. The time to be happy is now. The place to be happy is here. The way to be happy is to help make others so."

Ingersoll brought a ready wit to his attacks on traditional Christianity, as two brief examples will attest. Dining alone prior to an evening lecture, Ingersoll was spotted by a Catholic priest. The priest approached him and demanded, "How dare you disagree with Sir Issac Newton? He believed in God!" Ingersoll smiled and replied, "How dare you, sir, disagree with Sir Issac Newton, he was a Unitarian!" On another occasion, a young man timidly approached Ingersoll on a train. Summoning up his courage, he introduced himself as a cigar maker and asked Ingersoll's permission to attach his name to a new cigar. Smiling, Ingersoll replied, "Certainly—and what's more, I'll give you a slogan for the Ingersoll Cigar. 'Smoke in this world—not the next!'"

Ingersoll profoundly frustrated his religious critics; though he lacked the religious beliefs that they believed necessary for moral living, his conduct was irreproachable. No Ingersoll critic documented a single irregularity in Ingersoll's business dealings or in his personal life, notwithstanding prodigious efforts. By all accounts Ingersoll's family life was idyllic. Mocking his Christian attackers, Ingersoll once recounted an effort to spread the malicious rumor that his son was a hopeless drunkard. He spun out the story, pausing for effect until he smiled and reminded his listeners: "I have no son."

Preservation of Ingersoll's Lectures. As previously mentioned, Ingersoll carried his entire repertoire in memory. Texts of a few popular lectures were published during his life by his son-in-law, Clinton P. Farrell; others were published independently by enterprising local publishers who would be regarded today as bootleggers. (Frequently they retained stenographers to attend an Ingersoll lecture and write down every word, a task performed with varying accuracy.) Though Ingersoll's wife, Eva, had filled one hundred scrapbooks with newspaper accounts of his speeches and interviews, no authoritative text existed for most of his lectures. Goaded by his son-in-law, Ingersoll spent the last two summers of his life reviewing and correcting the newspaper accounts, then writing out the final versions in longhand. This task had but lately been completed when he died on July 21, 1899.

The recovered lectures filled the first four volumes of the twelve-volume *Works of Robert G. Ingersoll.* Farrell first published this collection in 1900 under the imprint of the Dresden Publishing Company, named for the village of Ingersoll's birth. The Dresden Edition, as the collection became known, went through many printings. Printings after 1911 included an Ingersoll biography by Herman Kittredge as a thirteenth volume. The last sizable printing was struck in 1929.

Ingersoll's Death. Ingersoll died of a heart attack on July 21, 1899, in Dobbs Ferry, New York. He was buried with full military honors in Arlington National Cemetery. The religious establishment rejoiced; its prayers had been answered! A number of libraries discarded or destroyed Ingersoll's books. Prelates who had struggled unsuccessfully to uncover a single immoral act by this "Godless infidel" assumed that, following his death, Ingersoll's secularism would no longer pose a threat to organized religion.

They were almost right. Ingersoll established no organization to promote his secularism. He twice served as president of the leading unbeliever organization of the day, the NATIONAL LIBERAL LEAGUE, but split with it repeatedly over its policy regarding birth control information. Some league activists wanted to distribute birth control information through the mail (see BIRTH CONTROL AND UNBELIEF); Ingersoll regarded that as indecent.

Organized HUMANISM, atheism, ETHICAL CULTURE, and RATIONALISM would emerge later, without direct succession from Ingersoll or the organizations of his day. And they would never enjoy the popularity Ingersoll knew.

America's so-called Golden Age of Freethought began at the end of the Civil War, when the impact of Charles DARWIN's *Origin of Species* began to be felt. It ended with Ingersoll's death just before the turn of the twentieth century. The last significant public figure who had actually heard Ingersoll and publicly embraced secularism as a result was Clarence DARROW: fittingly, the lawyer who defended evolution in the Scopes trial. Darrow died in 1938.

Ingersoll's Disappearance from History. Robert Green Ingersoll is the best-known American of the past who is so largely unknown today. During his life he was known to all—orthodox Christians who reviled him (though thousands paid to hear him) as well as numberless freethinkers who credited his words with liberating them from the cruelty and fears fostered by religion. How is it, then, that in one short century this towering figure has become a footnote to history? In 1912 journalist Michael Monahan gave the best explanation for Ingersoll's "disappearance" from the mind of the American public: "The circle of the man's philanthropy was complete. He filled the measure of patriotism, civic duty, of the sacred relations of husband and father, of generosity and kindness towards his fellowman. But he had committed treason against the Unknown, and this, in spite of the fame and success his talents commanded, made of him a social Pariah. The herd admired and envied his freedom, but for the most part, they gave him the road and went by on the other side."

We shall never see the likes of Robert Ingersoll again. Truly, his only fear was the fear of doing wrong. Fortunately he has not been totally erased from history. He was the subject of thirteen biographies, the most recent, Frank Smith's excellent biography, appearing in 1990. The Dresden Edition remains available online, on CD-ROM, and on the antiquarian book market. The Council for Secular Humanism operates a freethought museum at Ingersoll's birthplace and a variety of online freethought

history resources. Ingersoll once said, "The hands that help are better far than the lips that pray." Today a handful of hands are seeing to it that the memory of this remarkable American will not be wholly lost.

AND ROGER E. GREELEY

INTELLIGENT DESIGN THEORY. A modern version of creationism (see CREATIONISM AND UNBELIEF; EVOLUTION AND UNBELIEF), intelligent design theory is based on the assumption that the universe in general and biological life in particular are too complex and too highly specified to have come into existence by chance and therefore must be products of purposeful action by an intelligent designer.

Despite its religious roots, intelligent design "theorists" present it as a "scientific" theory.

In its most recent rendition, intelligent design theory entered the discourse in the early 1990s as a version of creationism more sophisticated than its precursors (such as creation science or young-earth creationism). Creation science had suffered legal defeats, including the 1987 US Supreme Court ruling in *Edwards v. Aguillard.* This and other court decisions (notably the landmark decision of December 2005 in *Kitzmiller v. Dover School Board*) determined that creation science is not science but religion, and therefore cannot be taught in public school science classes because doing so would violate the Establishment Clause of the First Amendment to the US Constitution.

Intelligent design theorists have largely abandoned the most egregious absurdities of the earlier creation science movement (such as the assertion that the Second Law of Thermodynamics makes evolution impossible). The key figures of intelligent design theory are well educated, sport advanced degrees from prestigious universities, and use argumentation that is suffused with mathematical symbolism, accompanied by references to real scientific sources, and often impressive looking on its face. Nevertheless, the scientific community has overwhelmingly rejected intelligent design theory, viewing it as just a better-packaged version of creationism ("creationism in a cheap tuxedo").

Intelligent design theory is essentially a more elaborate and refined version of the argument from design, which has a long tradition (see EXISTENCE OF GOD, ARGUMENTS FOR AND AGAINST). A famous rendition of the argument from design was offered by William Paley in 1802. According to Paley, nobody would assume that such a complex contraption as, say, a watch, whose multiple parts are well matched and perform a specific function, could have emerged spontaneously ("by chance"). A watch displays unmistakable features of design. Paley's argument concluded that "if there is a watch, there must be a watchmaker." Since the universe is more complex than a watch and features an intricate clocklike order, thus displaying the signs of design, Paley's idea extends to the universe the assertion that "if there is design, there must be a designer."

For Paley and many of his followers, the designer was unequivocally identified as the God of the Christian Bible. However, in modern versions of argument from design such as intelligent design theory, the identity of the designer is often deliberately left undefined, or sometimes is assumed to be some entity of an extraterrestrial origin, as in the Raëlian cult.

The argument from design was shown to be philosophically deficient by the British philosopher David HUME in 1777, but nevertheless has recrudesced time and time again since the publication of Paley's book.

Essentially, the argument from design is tantamount to the argument from improbability: the spontaneous emergence of a complex contraption such as a watch has an exceedingly small probability, therefore its existence leads to a design inference.

The estimation of probability depends on our knowledge about the situation. The reverse side of the coin is that probability reflects the level of ignorance about a situation. Therefore the argument from design is in fact a version of the argument from ignorance (also known as the God-of-the-gaps argument).

One fatal weakness of the argument from design is the

problem of infinite regress. If the universe and/or biological life are products of a purposeful design, the inevitable question is: Who designed the designer? If the probability of the universe's existence by chance is extremely small, so must be the probability of the existence of its creator, as well as that of the creator's creator, and so on ad infinitum. Applying Occam's razor, the preferable conclusion is that there is no reason to hypothesize the existence of a supernatural creator.

Emergence of the Intelligent Design Movement: Phillip Johnson. The recent vigorous activity of intelligent design theorists began with the publication of the book *Darwin on Trial* by Phillip Johnson, a professor of law at the University of California, Berkeley. Its main content was an assault on evolution theory that, according to Johnson, is grounded in materialistic philosophy while not supported by genuine scientific data.

In *Darwin on Trial* and in a series of subsequent publications, Johnson covered numerous points, rejecting essentially all the tenets of Darwinism (see DARWINISM AND UNBELIEF). One such point is the alleged unbridgeable chasm between microevolution and macroevolution. The term *macroevolution* as a part of the parlance of evolutionary biology in the usage of intelligent design advocates refers to changes that biological organisms undergo without producing new species—and hence also no taxonomic groups above the species level. Most intelligent design advocates accept microevolution as an observed fact (for example, the development of strains of bacteria resistant to antibiotics, or creating various breeds of dogs). What intelligent design advocates including Johnson deny is macroevolution (or, more properly, speciation), in which new species or even larger taxonomic categories develop as a result of descent with modification. Evolutionary biology denies any substantive difference between microevolution and macroevolution. Random mutations in the genome accompanied by natural selection (and/or by a number of other mechanisms studied by evolutionary biology) have no limits that would prevent the emergence of new species. When enough differences accumulate in the genome and the novel forms of organisms happen to be geographically separated from their progenitor form, the new offspring may become incapable of interbreeding with the progenitor species and so a new species emerges. The fact of speciation has been well established.

Another point Johnson construes as an argument against Darwinism is the Cambrian explosion, the emergence of new groups of organisms in the course of *relatively* short period of time (a few million years) some 540 million years ago. In fact, evolutionary biology can account for the Cambrian explosion quite comfortably.

Johnson also offers a series of purely philosophical arguments, suggesting that the theory of natural selection is pure tautology and that Charles DARWIN's theory is nothing more than circular reasoning. These points in Johnson's output have been repudiated from within his own camp as philosophically invalid.

Professional biologists have overwhelmingly rejected Johnson's arguments. In particular, a critique of Johnson's book reflecting a consensus of biologists was published by the prominent expert in evolution theory Stephen Jay GOULD in 1992. It was followed by other critical reviews of Johnson's literary output from various standpoints. Nevertheless Johnson's book, with its lawyerly style of argument delivered with considerable eloquence, has gained wide popularity among religiously inclined audiences. This audience finds in Johnson's book what they consider a well-substantiated repudiation of evolution theory, which they view as being at odds with their religious beliefs.

As Johnson has claimed himself, and as was acknowledged more than once by his followers, he "assumed the leading role" in an enterprise which soon became known as the intelligent design movement.

In the early 1990s Johnson was instrumental in establishing the Center for Renewal of Science and Culture (later renamed Center for Science and Culture; CSC) at the Discovery Institute in Seattle, Washington. The Discovery Institute is a conservative think tank funded by large grants from various sources, among which ultraconservative religious foundations hold a prominent place.

In a few years a group of intelligent design theorists coalesced at the Discovery Institute. Most of the known intelligent design theorists are fellows of the Discovery Institute.

Since Johnson possesses no scientific background, he soon became a figurehead of the intelligent design movement, leaving the detailed discussions to his better-educated younger colleagues.

Behe: Irreducible Complexity. A milestone in the intelligent design movement was the publication of the book *Darwin's Black Box* (1996) by Michael J. Behe, a professor of biochemistry at Lehigh University. Behe is one of the few intelligent design advocates who is a genuine scientist with a record of publications in peer-reviewed journals. The book in question, however, is no scientific monograph, but rather a popular tale addressed to a general audience, and has little relation to Behe's biochemical research. This book has gained considerable popularity and has been widely reviewed.

In his book Behe introduced the concept of irreducible complexity of molecular assemblies in biological cells. According to Behe, a system is irreducibly complex if it performs a certain function (for example, clots blood) and consists of such well-matched and indispensable parts that the removal of even a single part renders the system dysfunctional.

Behe maintained that an irreducibly complex system could not have evolved by a Darwinian path (which entails random mutations and natural selection). Indeed, Darwinian evolution works only on existing, already

functioning systems. Since a system that has even only one part of the irreducibly complex system missing, is, by Behe's definition, dysfunctional, it could not have served as an evolutionary precursor to the irreducibly complex system. Hence, stated Behe, irreducibly complex systems must have been created rather than evolved from precursor systems.

Behe's concept of irreducible complexity was not really new. To start with, long before Behe, advocates of argument from design had suggested similar ideas but applied them not to the molecular assemblies in the cell, but to, say, the eye, or to the venom-injecting system of snakes. When arguing that an eye could not have evolved by a Darwinian path because "half an eye is of no use," the antievolutionists had in fact used the same reasoning Behe did for protein systems in a cell. Moreover, even the concept of irreducible complexity in molecular systems had been suggested some ten years prior to Behe's book.

Most biologists rejected Behe's concept and indicated that irreducibly complex systems, as Behe defined them, could have evolved by a Darwinian path indirectly, utilizing what metaphorically has been called a scaffold approach. This term has been borrowed from the practice of building various structures, for example, arches. The arch cannot stand unless its lateral halves are locked together by a keystone. On the other hand, the keystone cannot stay in place unless supported by the rest of the arch. However, the problem is easily solved by using scaffolds which are removed after all parts of the arch are in place. Similarly, precursors to an irreducibly complex system could have existed but could have had functions different from the present functions (such examples abound in the biological literature); after the irreducibly complex system evolved from a precursor, some of the precursor's parts become unnecessary and, like a scaffold, are disassembled by the evolutionary process.

In his book and in several papers, Behe disputed critiques of his work. However, he ignored the extensive literature wherein biologists provided many examples of realistic Darwinian paths that could have led to the evolution of irreducibly complex systems.

Although Behe's book has been subjected to a strong critique from various standpoints, both within and without biology, and was almost unanimously rejected by mainstream biology, intelligent design theorists adopted Behe's idea of irreducible complexity of protein systems in the cell as one of the main tools in defense of their theory.

Intelligent Design Theory Goes Mathematical: William Dembski. The next milestone in the development of intelligent design theory was the publication of *The Design Inference* (1998) by William A. Dembski, followed in the next few years by several other books by the same author. Dembski possesses advanced degrees in mathematics, philosophy, and theology. He brought to intelligent design theory a new level of seeming sophistication. In fact, however, his numerous publications cannot conceal that Dembski has neither performed any real scientific research nor made any innovative contribution to mathematics. Dembski has introduced into intelligent design theory several concepts that, along with Behe's idea of irreducible complexity, have become pillars of the theory. These concepts are: (a) the explanatory filter (EF); (b) the law of small probability and the associated concept of the universal probability bound (UPB); (c) complex specified information (CSI), also referred to as specified complexity; (d) the law of conservation of information (LCI), acclaimed by intelligent design advocates as a revolutionary breakthrough on a par with Newton's discoveries; (e) the calculation of the probability of a spontaneous emergence of complex biological structures such as the bacterial flagellum, and some others. Dembski's ideas have not only been largely ignored by mainstream science, they have also been repudiated by a number of experts in pertinent fields (such as information theory and molecular biology).

Dembski's explanatory filter is a flow chart that supposedly can serve as a reliable tool for discriminating between necessity (regularity, law), chance, and design as the causes of an event. Although the explanatory filter has been vigorously promoted by Dembski and praised by his cohorts, it has so far never been used to solve any specific problem. As critics have pointed out, the procedure prescribed by the explanatory filter is unrealistic. The artificial demarcation between three distinctive causes—necessity, chance, and design—does not reflect reality because more than one cause is often instrumental in causing an event. The fatal shortcoming of the EF is that it produces both false negatives and false positives, thus making it an unreliable tool.

Dembski's law of small probability states: "Specified events of low probability do not occur by chance." He suggests the threshold of the sufficiently small probability named the universal probability bound (UPB), which is about 10^{-150}. Dembski obtained this number by multiplying three quantities: (1) the estimated number of particles in the known universe (10^{80}); (2) the maximum number of interactions between particles (i.e., the number of state changes) per second (10^{45}); and (3) the age of the known universe (less than 10^{25} seconds). As can be shown, the value of UPB suggested by Dembski is based on poorly substantiated assumptions. For example, the number of particles in the universe may in fact be immensely larger than 10^{80} if we account for the actual (unknown) size of the entire universe (rather than only for the known, observable part of it).

Moreover, regardless of the value of UPB, adding specification does not save the design inference from being a purely probabilistic exercise. Analysis of CSI shows that its three components (information, complexity, and specification) in Dembski's rendition all represent, either directly or indirectly, the probability of an event. Therefore arguments in favor of intelligent design

based on CSI essentially boil down to the worn-out argument from improbability. This type of argument states that the universe (or biological life) is so complex that its spontaneous emergence is too improbable to be considered seriously. The argument from improbability has no evidentiary power and science has successfully explained how extremely complex objects could have spontaneously emerged without a supernatural guiding hand (as, for example, in studies of self-organization).

The argument from improbability (especially in its form of a God-of-the-gaps argument) has been rejected as unreliable even by some philosophers among intelligent design advocates.

Dembski's law of conservation of information (2002), for which he claims the status of a Fourth Law of Thermodynamics, was acclaimed by intelligent design advocates as a revolutionary breakthrough in science. It was, however, shown to contradict the Second Law of Thermodynamics. It has not been accepted in either information theory or in thermodynamics, but is nevertheless persistently promoted by intelligent design advocates as an allegedly great scientific achievement.

Dembski's calculations of the probability of a spontaneous emergence of complex biological structures (such as a bacterial flagellum) are based on a multiplication of partial probabilities of imaginary sequential steps, each requiring coincidences of a very low probability (for example, a coincidental gathering of numerous proteins which are constituents of the emerging flagellum, all in the same location at the same time). No biologist has suggested a process like that imagined by Dembski, wherein the improbable coincidences are assumed to be the steps of biological evolution. His approach is analogous to the example of the "tornado in a junkyard" creating by chance an airplane. This scheme of many coinciding improbable events has nothing to do with biological science, which has developed many ideas regarding the pathways of evolution, in particular for the flagellum, wherein no assumptions of such improbable coincidences need be suggested. Dembski's calculations are irrelevant for biology.

Likewise certain other parts of Dembski's conceptual conglomerate are either plainly erroneous or irrelevant. A telling example is Dembski's misuse of certain theorems of optimization theory—the no free lunch (NFL) theorems. As one of the originators of these theorems, David Wolpert, wrote, "Dembski's treatment of the No Free Lunch Theorems is written in jello." Dembski's attempt to assert that the NFL theorems make evolution via a Darwinian path impossible was based on a misinterpretation of these theorems. The NFL theorems show that no search algorithm (including an evolutionary algorithm) is better than any other algorithm if its performance is averaged over all possible fitness landscapes. Dembski interpreted this result as a proof that evolutionary algorithms cannot outperform blind search. Since blind search is too slow for evolution to have happened during the earth's existence, evolution must be not feasible as the mechanism of appearance of the variety of species—or so says Dembski. However, Dembski ignores the crucial feature of the NFL theorems: they refer only to the *average* performance of various algorithms. They say nothing about relative performance of various algorithms on particular fitness landscapes. In fact, evolutionary algorithms are known to immensely outperform blind search on relevant landscapes, and therefore the NFL theorems in no way prohibit evolution.

One more concept promoted by Dembski is the displacement problem, rendered by Dembski in two versions, incompatible with each other. Its essence is that the evolution process (which Dembski equates to a "search") allegedly requires a preceding search over the "information-resource" space in order to find either the pertinent fitness function (in the original version of the problem) or the search algorithm suitable for the particular search (in the second version). The information-resource space, according to Dembski, is supposedly much larger than the original search space, so the problem becomes much harder to solve, thus, again, allegedly making evolution improbable.

This schema is unsubstantiated in both versions. In real-life problems both search algorithms and fitness functions are given and therefore there is no need to search some information-resource space (the concept of which is absent in the context of the NFL theorems).

In 2004 Dembski announced that he is working on a set of papers under the overall title "Mathematical Foundation of Intelligent Design." As of April 2006 he had posted on the Internet the first three installments of the planned set. In the first installment Dembski claimed to have developed a new measure of information he labeled "variational information." However, as was immediately pointed out on the Internet by experts in the matter, this article did not offer any new mathematics. In fact Dembski's allegedly novel concept of variational information was identical with a quantity well known for more than forty years, Rényi's divergence of the second order. Additionally, some of Dembski's derivations in that article were shown to be in error. Dembski hastily amended his article, adding a reference to Rényi, but the amendments contained imprecise notions. More important, though, the article in question, regardless of its quality and contrary to Dembski's announced goal, contained no notions relevant to intelligent design.

As the second installment in the announced set, Dembski resurrected his article about uniform probability, which was published fourteen years earlier. Like the first installment, it had practically no relevance to intelligent design, for which it supposedly provides a mathematical foundation. In the third installment (where Dembski introduced the second version of the displacement problem), he suggested to construe evolution as a search for a small target in a large search space.

According to Dembski, such a search is hardly capable of locating the target unless it is "assisted" by input from some intelligent source, hence natural evolution must be impossible. This argument is false because evolution is not a search for a target; it is not directed to a predetermined outcome and therefore all Dembski's mathematical exercises based on his schema are irrelevant both to evolution theory and to the intelligent design concept. There is no reason to expect that the entire set of promised articles will provide a foundation for intelligent design, mathematical or otherwise.

Other Proponents of Intelligent Design. Besides Johnson, Behe, and Dembski, there are among the prominent members of the pro–intelligent design task force the philosophers Stephen C. Meyer, Jay W. Richards, and John M. Reynolds; the biologist/theologian Jonathan C. Wells; the astronomer Guillermo Gonzalez; and others.

Intelligent design advocates have often been criticized for their failure to publish papers in peer-reviewed scientific journals, which reflects the absence of scientific content in their theory. Apparently this critique caused discomfort in intelligent design circles, so intelligent design advocates began striving to break into peer-reviewed media. Meyer was apparently one of the intelligent design advocates who succeeded. He found a crack in the wall of the reviewing procedure when the editor of *Proceedings of the Biological Society of Washington* was temporarily an apparent sympathizer of intelligent design. Meyer's review paper arguing in favor of intelligent design appeared in that journal in 2004. The publication of Meyer's paper caused loud jubilation in intelligent design circles. The leadership of the Biological Society of Washington promptly disavowed Meyer's paper and stated that the editor, Richard von Sternberg, violated the policies of the journal. Biologists who criticized Meyer's paper pointed out that Meyer's review contained no original research results, that Meyer made some unsubstantiated claims, ignored many of the relevant sources that contradict his thesis, and that overall his paper was "substandard."

Jonathan C. Wells is perhaps the foremost biologist (besides Behe) in the intelligent design movement. As Wells himself revealed, he was chosen to get a PhD degree in biology by his "spiritual father," Unification Church leader Sun Myung Moon, with the explicit goal "to destroy Darwinism." Obviously such an intention adopted before having studied the subject points to Wells's preconceived bias. Wells published a popular book titled *Icons of Evolution* (2002), wherein he pounced on a number of features found in the textbooks on biology. Among these features are the famous Miller-Urey experiment, which demonstrated spontaneous production of amino acids in a simulated primeval atmosphere subjected to electric discharge; observations of industrial melanism in the peppered moth; Ernst Heinrich HAECKEL's drawings of embryos of various species; and the like. Wells maintained that all these "icons" of evolutionary theory are at best in error and at worst fraudulent. Like the rest of the antievolution arguments, Wells's assertions were overwhelmingly rejected by mainstream biologists, who pointed to multiple distortions and misrepresentations of facts in Wells's book.

Another aspect of intelligent design was presented in Guillermo Gonzalez and Jay W. Richards's *Privileged Planet* (2004). These authors argue in favor of intelligent design, pointing to the alleged unique properties of the earth, which, they maintain, combines highly improbable "habitability" and "measurability." Most of the authors' arguments are based on correlations. Such an approach, as is known from mathematical statistics, should be used with caution as it often leads to arbitrary conclusions. This seems to be the case with Gonzalez and Richards's assertions, which at best allow for various interpretations, often contradicting those drawn by the authors.

Conclusion. In March 1999 a paper from the Discovery Institute that became known as the Wedge Document surfaced on the Internet. Its principal author is believed to be Phillip E. Johnson. It contained a detailed plan for achieving a complete overhaul of science based on intelligent design theory. This victory would be achieved in stages. While in the initial stages of the "Intelligent Design revolution" its religious motivation would be kept under wraps for tactical reasons, ultimately it would result in "nothing less than the overthrow of materialism and its cultural legacies."

The Wedge Document was a five-year action plan for the intelligent design movement covering the period between 1999 and 2003. In fact, however, the Wedge Document was supposedly laying foundation for an "Intelligent Design revolution" over a much longer period of time. The details of the Wedge Document and the progress in the implementation of its staged strategy are described by Barbara Forrest and Paul R. Gross in *Creationism's Trojan Horse* (2004). The plan envisioned activities in several directions, including publication of books and papers promoting intelligent design theory, public relations campaigns, organizing conferences, interviews, lobbying politicians and governmental agencies, and working with school boards all over the country with the aim of introducing the intelligent design theory into school curricula, first under the slogan "teach the controversy" but ultimately as a legitimate alternative to "naturalistic" science.

At the end of the initially envisioned five-year period, it was clear that the intelligent design movement had achieved substantial success in those aspects of its actions that related to public relations, recruiting politicians to their cause, and gaining considerable publicity. President George W. Bush spoke in favor of intelligent design, as did Democratic presidential candidates. Language supportive of intelligent design has found its way into resolutions of the US Senate (although it failed to

become law). A number of school boards in several states included intelligent design theory in the curricula of a few local schools (although such cases are so far rare, and have been subject to lawsuits from parents and organizations defending scientific education). Intelligent design advocates also published dozens of books and many papers, as well as a great many Web postings promoting intelligent design theory. However, the other part of the Wedge strategy, which envisioned intelligent design theory breaking into mainstream science, had failed. There were no papers in mainstream scientific media where results of genuine research based on intelligent design concepts were presented. Intelligent design advocates had not suggested a single testable scientific hypothesis relevant to intelligent design theory in any field of science. They had suggested no research program based on intelligent design theory. From this, it was clear that intelligent design theory is scientifically futile and that its quasi-scientific mantle barely conceals its religious roots and motivations.

INTERNATIONAL HUMANIST AND ETHICAL UNION (IHEU). The International Humanist and Ethical Union is an international federation of humanist organizations. It unites a hundred member organizations from thirty-seven countries worldwide. Member organizations represent a diversity of movements: humanists, atheists, rationalists, secularists, ETHICAL CULTURE groups, religious humanists, agnostics, skeptics, and freethinkers (see ATHEISM; RATIONALISM; SECULARISM; RELIGIOUS HUMANISM; AGNOSTICISM; SKEPTICISM; FREETHOUGHT). However, the IHEU stresses what binds all of these together—in the words of former IHEU president Levi Fragell, "the eight letters," that is, HUMANISM without qualifying adjectives.

The IHEU's mission is threefold. First, it wants to stimulate international contact between humanists worldwide, and serve as "a clearing-house for [humanist] information and inspiration." Humanists can meet at world congresses, held every two to five years, and more frequent regional conferences. In between congresses, the IHEU's quarterly newsletter, *International Humanist News*, and its Web site keep humanists informed about relevant developments worldwide.

Second, the IHEU strives to promote humanism as a LIFE STANCE and as an authentic ethical alternative for religion (see EUPRAXSOPHY), and to work out a humanist identity. The voice of the IHEU has been condensed in hundreds of public statements issued by IHEU congresses or by its board. These vary from limited comments in specific affairs to comprehensive declarations of principle, such as the Amsterdam Declarations of 1952 and 2002,

which aimed to define basic features of humanism, or an appeal for a new global ethics based on the 1988 statement "Planetary Humanism."

The IHEU also supports humanist organization building in countries where humanism is still feeble. In the 1950s such an initiative in Norway was very successful, but later, similar attempts in the third world and in the former Soviet states were often handicapped by communication problems, insufficient knowledge of the local situation, and other causes. Only since 1988, when the IHEU launched a momentous partnership with the Dutch Humanist Institute for Development Cooperation (HIVOS), have results improved, both in the form of wholesome developmental projects and in the form of regional and local humanist networks.

The IHEU's third major task is to represent the humanist voice in international bodies. Since its founding congress, the IHEU has voiced its close engagement with the United Nations and with issues of global importance, such as the nuclear arms race, the world population explosion, and third world underdevelopment. The IHEU now has representatives at the United Nations in New York, Geneva, and Vienna, at UNICEF and UNESCO, and at the Council of Europe.

History. The IHEU was founded August 26, 1952, at an international humanist congress in Amsterdam presided over by Sir Julian HUXLEY. The founding members were seven organizations from Europe, the United States, and India. The initiative was prepared by Jaap VAN PRAAG of the Dutch Humanist League HV and the Englishman Harold J. BLACKHAM. Both intended to create an alternative to the already existing World Union of Freethinkers (WUFT), which they had found to be too rigidly antireligious and anticlerical (see ANTICLERICALISM).

IHEU headquarters was set up within the office of the Dutch Humanist League at Utrecht. Practical difficulties were formidable. The IHEU was a tiny organization with worldwide pretensions, a small budget, unreliable communication with its members, and heavy dependence on volunteers. It was not until the 1960s that substantive projects could be started. These included working parties that brought together humanists from several countries who were interested in the same subject, a separate humanist youth organization (IHEYO), and a series of dialogues with representatives of other life stances, including Roman Catholics and Marxists.

In 1997 IHEU headquarters moved from the Netherlands to London. There, under a new executive director and through wider use of the Internet and other modern media, communication was revolutionized, resulting in more efficient decision-making processes, rapid response to vital developments worldwide, and increased publicity. Successful campaigns were launched in support of victims of blasphemy legislation, such as Bangladeshi writer Taslima NASRIN and Pakistani professor Younus Shaikh. Activities focused on issues such as bioethics, women's rights, and further development of the youth movement. Much attention was also given to supporting humanist initiatives in South Asia, Latin America, and Africa.

HANS VAN DEUKEREN

ISLAM, UNBELIEF WITHIN. We know from the Qur'an itself that there were Arab skeptics in Mecca who did not accept the "fables" recounted by Muhammad; they scoffed at his notion of the resurrection of the body, they doubted the divine origins of his "revelation," and they even accused him of plagiarizing pagan Arab poets. Pagan Arabs were seldom wont to thank superior powers for their worldly successes, and we should not be surprised that these pagan attitudes prevailed in the early years of Islam. Arabs converted out of cupidity and hope of booty and success in this world. Thus many outwardly confessed their belief but in fact had no inclination toward Islam and its dogma and ritual. At the death of Muhammad, the number genuinely converted to his creed did not exceed a thousand. If things went wrong, the Bedouins were ready to drop Islam—that is, to apostasize—as quickly as they had adopted it. The fact that Islam restricted wine drinking and sexual intercourse, "the two delicious things," did not endear Muhammad's religion to them, either.

The Arabs also resisted the institution of Muslim prayers, in particular ridiculing their associated body movements. There is much evidence for the indifference of the desert Arabs to prayer, for their ignorance of the elements of Muslim rites, and even for their indifference toward the Qur'an itself, including their ignorance of its most important parts. The Arabs always preferred to hear the songs of the heroes of paganism rather than holy utterances from the Qur'an. Al-Jahiz, himself gently skeptical and a Mu'tazilite, recounts how the Arabs mocked and derided the Qur'an. A Muslim leader of the early days is reputed to have said: "If there were a God, I would swear by his name that I did not believe in him."

The general ignorance of Islamic doctrine and ritual continued well into the first Islamic century under the first ruling dynasty, the Umayyads. Indeed, Islam cannot properly be said to have existed in the sense of a fixed body of dogma until significantly later on. We glimpse the atmosphere in which the caliph al-Walid II grew up by these verses he addressed to the Qur'an, referring to Qur'anic threats against "stubborn opponents": "You hurl threats against the stubborn opponent, well then, I am a/stubborn opponent myself./When you appear

before God at the day of resurrection just say:/My Lord, Al-Walid has torn me up."

Al-Walid II is said to have stuck the Qur'an onto a lance and shot it to pieces with arrows while repeating the above verses. He certainly did not abide by its interdictions: an intensely cultivated man, he surrounded himself with poets, dancing girls, and musicians, living the merry life of the libertine with no interest in religion.

***Kafir*, *Mulhid*, *Murtadd*, and *Zindiq*.** The terms *Kafir* and its cognate *kufr*, *Mulhid* and its cognate *Ilhad*, *Murtad*, and *Zindiq* and its cognate *zandaqa* all have precise meanings. But in fact they were used synonymously in a very loose way to mean deviator, apostate, heretic, renegade, unbeliever, atheist, materialist, and skeptic. To complicate matters further, even the precise meaning of each term changed over the centuries. Thus, for example, *Mulhid* was used during the Umayyad period as a synonym for "rebel" and "splitter of the ranks of the faithful." Soon after the Abbasids took power as the ruling dynasty in 750, *Ilhad* came to signify materialist skepticism and atheism.

Strictly speaking, *Zindiqs* were the adherents of Manichaeism, a dualistic doctrine of primeval conflict between God and matter, light and darkness, truth and error. Yet the term *Zindiq* came to be applied indiscriminately to heretics (see HERESY), atheists (see ATHEISM), and freethinkers (see FREETHOUGHT). Fear of persecution made it difficult for writers and thinkers to express their views openly, and so we are often left wondering what any particular *Zindiq* really thought.

Djad ibn Dirham was said to be a materialist (see MATERIALISM); his followers are said to have accused the Prophet Muhammad of lying and to have denied the resurrection. Serious persecutions of *Zindiqs* began under the Abbasid caliph al-Mansur. Many *Zindiqs* were put to death under his reign, the most famous being Ibn al-Muqaffa, who was the intellectual heir to the rationalist tradition that flourished at the time of the Sassanid king Chosroes Anusharwan. The latter is said by the scholar Gabrieli to have fostered a "veritable Hellenistic *Aufklarung* (Enlightenment)." At any rate, Ibn al-Muqaffa attacked Islam, its Prophet, its theology and theodicy, and its concept of God from the perspective of the Manichaean faith. How do we reconcile Ibn al-Muqaffa's rational skepticism and his adherence to Manichaean dualism? Some scholars point out that intellectuals like Ibn al-Muqaffa had already given an allegorical interpretation to the Manichaean mythology, interpreting the universe and man's place in it in gnostic, even Hellenistic and rational, terms.

Under Mansur's successors caliph al-Mahdi and al-Hadi, repression, persecution, and executions were applied with even greater ferocity. Special magistrates were appointed to pursue heretics, the whole inquisition being masterminded by the Grand Inquisitor, called the *Sahih al-Zanadiqa*.

Ibn Abi-l-Awja was one of the more interesting *Zindiqs*. He believed that light had created good, while darkness had created evil; he also taught metempsychosis (the transmigration of souls after death) and the freedom of the will. Before his death, Ibn Abi-l-Awja confessed that he had fabricated more than four thousand traditions (hadith) in which he forbade Muslims from doing what was in fact permitted, and vice versa—that is, he made Muslims break the fast when they should have been fasting and so on. He is supposed to have posed the problem of human suffering (see EVIL, PROBLEM OF), asking: "[W]hy . . . are there catastrophes, epidemics, if God is good?" A recorded discussion with the imam Jafar al-Sadiq reveals the full extent of his unorthodoxy: according to the record, he believed in the eternity of the world and denied the existence of a creator. One day he asked Jafar to justify the institution of pilgrimage, and refused to accept the answer that it was ordered by God, since this reply merely pushed the question further back to someone who was not present. He also cast doubt on the justice of some of the punishments described in the Qur'an. Ibn Abi-l-Awja was also said to accuse some of the prophets mentioned in the Qur'an of lying, in particular Abraham and Joseph. Like so many *Zindiqs* of the period, he doubted the official dogma of the inimitability of the Qur'an. Even if we cannot specifically link the above dialogue with the historical figure of Ibn Abi-l-Awja, it gives a true picture of *Zindiq* beliefs of that time. He was taken prisoner and put to death in 772.

One of the charges often leveled at *Zindiqs* such as Bashshar bin Burd was that they continually undermined the orthodox view of the miraculous nature of the Qur'an, whose text the orthodox considered inimitable. On the orthodox view, no mortal writer was capable of matching the perfection of the Qur'an. Bashshar bin Burd, a poet, seems to have denied the resurrection and the last judgment in some of his verses. He may well have believed in metempsychosis as well. In celebrated verses Bashshar defended Iblis (the devil), being made of fire, for refusing to prostrate himself before Adam, who was made of ordinary clay. In another verse Bashshar prayed to the Prophet Muhammad to join with him in an attack upon the deity. He also seems to have held Manichaean beliefs laced with Zoroastrianism. But, in the words of the scholar Régis Blachère, "along with these beliefs there would seem always to have been a profound skepticism mingled with a fatalistic outlook leading Bashshar to pessimism and hedonism." Still prudence obliged him to pay lip service to orthodoxy. This view of Bashshar as a skeptic is endorsed by the scholar Vadja, who argues that it seems totally out of character for someone as dissolute as he to adhere to a religion as ascetic as Manichaeism.

Basra produced a conspicuous but little-documented group of freethinkers. In our sources certain names keep cropping up, but seldom accompanied by details about their views or works. Thus we are told that Qays bin Zubayr was a notorious atheist, that al-Baqili denied the

resurrection, that Ibrahim bin Sayyaba was a *Zindiq,* even that he claimed that pederasty was the first law of *zandaqa.*

We know a little more about Muti bin Iyas, who gives every sign of being a *Zindiq.* But the details we have of his life point rather to someone with a skeptical turn of mind but no deep interest in religion. Beginning his career under the Umayyads, he was devoted to the caliph Walid bin Yazid, who found in Muti a fellow after his own heart, "accomplished, dissolute, an agreeable companion and excellent wit, reckless in his effrontery and suspected in his religion." When the Abbasids came to power, Muti attached himself to the caliph Mansur. Many stories are told of the debauched life, which he led in the company of *Zindiqs* or freethinkers. As scholar R. A. Nicholson observed, "His songs of love and wine are distinguished by their lightness and elegance."

Abu Isa Muhammad bin Harun Al-Warraq was accused of *zandaqa* and is important for, among other reasons, being the teacher of the Great Infidel himself, Al-Rawandi. Unfortunately none of his literary work survives; we have only tantalizing glimpses of it in quotations by other Arab scholars. Some of his works are also known from refutations which have survived. Al-Warraq began as a Mu'tazilite theologian, but seems to have been excommunicated for holding heterodox opinions. He wrote a remarkable history of religions in which his objectivity, rationalism, and skepticism enjoyed free rein. His critical examination of the three branches of Christianity of his time again reveal his dispassionate tone and rationalism, free from any hint of dependence on revelation.

Al-Warraq's political sympathies may have lain with the Shia party, and it is uncertain whether he was really a Manichaean. However, he does seem to have believed in the two principles of good and evil, and very certainly in the eternity of the world. The scholar Massignon correctly summed him up as an independent thinker and skeptic who embraced no fixed system of thought. A victim of the Abbasid persecution, Al-Warraq died in exile in Ahwaz in 909.

Al-Mutanabbi is considered by many Arabs as the greatest poet in the Arabic language. According to Blachère, Al-Mutanabbi was influenced in his religious and philosophical development by a certain Abu l-Fadl of Kufa, the town of his birth. Abu l-Fadl was a "complete agnostic" and an early patron of Al-Mutanabbi's works. Under l-Fadl's influence, Al-Mutanabbi cast off Muslim religious dogmas which he regarded as spiritual instruments of oppression. He then adopted a stoic and pessimistic philosophy (see STOICISM), holding that the world is made up of seductions which death destroys; stupidity and evil alone triumph. Out of social and political frustration, Mutanabbi led a rebellion of a politico-religious character, claiming to be a prophet with a new Qur'an. He was defeated, captured, and imprisoned for two years.

Al-Mutanabbi wrote a vast number of odes, sometimes praising second-rate patrons and at other times lauding the great Sayf al-Dawla, leader of the Aleppo (Syria) branch of the Hamdanid dynasty. Some of the odes are full of bombast, some are sublime; beneath them all we can discern a certain skeptical disillusionment with a world kept in chains by ignorance, stupidity, and superstition from which only death can liberate us. But, as the scholar Daniel Margoliouth points out, for many Muslims Al-Mutanabbi's odes are "defaced by utterances which imply disrespect for the prophets and revealed religion."

The spirit of philosophical inquiry did eventually lead to a questioning of the fundamental tenets of Islamic belief late in the ninth century, leading people like al-Kindi's pupil Ahmad bin al-Tayyib Al-Sarakhsi into deep trouble. Al-Sarakhsi, tutor to the caliph al-Mutadid, took an interest in Greek philosophy. He incurred the wrath of the caliph for discussing heretical ideas rather openly, obliging the caliph to order his execution in 899. According to the ninth-century historian al-Biruni, al-Sarakhsi wrote numerous treatises in which he attacked the prophets as charlatans. Al-Sarakhsi was led into his religious skepticism by the rationalism of the Mu'tazilites, with whom he sympathized, and by his own philosophical inquiries.

Often the historian of atheism wthin Islam is forced to rely on the works of Islamic scholars who made it their duty to refute thinkers and writers they considered atheist. The writings they attack often are not extant, and we should be thankful for these refutations, which often contain extensive quotes from the lost originals. This is the case, for example with both Ibn Rawandi and AL-RAZI.

From the early tenth century onward—the early Abbasid period—survive many refutations of the *mulhidun* or atheists. Thus, for example, the scholar Mulhid observes that the *"Kitab al-Radd ala'l-mulhid* by the Zaydi imam al-Kasim bin Ibrahim al-Rassi (died 860) clearly portrays the anonymous *mulhid* as a religious sceptic inclining to atheism." Other refutations were written by the grammarian Kutrub and the theologians al-Jahiz and al-Zabidi. Many of these refutations were written by Mu'tazilite theologians to whom we shall now turn.

The Mu'tazilites and Rationalism. There was great excitement in liberal circles in Europe in 1865, when Heinrich Steiner of Zurich published a study devoted to the ideas of the Mu'tazilites, whom he praised as the "freethinkers of Islam." Writing in 1906, the freethought historian John Mackinnon ROBERTSON still describes them as freethinkers. However, it is now clear that the Mu'tazilites were first and foremost Muslims, living in the circle of Islamic ideas and motivated by religious concerns. There was no sign of truly liberated thinking or of a desire, as Goldhizer puts it, "to throw off chafing shackles, to the detriment of the rigorously orthodox view of life." Furthermore, far from being "liberal," they turned out to be exceedingly intolerant and were involved in the *Mihna,* the Muslim Inquisition under the Abbasids.

However, the Mu'tazilites are important to a discussion of Islam and unbelief because they introduced Greek philosophical ideas into the discussion of Islamic dogmas. These in turn brought with them skepticism, rationalism, and liberating doubt that could only lead to opposition to current orthodoxy. They were, Goldziher reminds us, "the first to expand the sources of religious cognition in Islam so as to include a valuable but previously—in such connection—rigorously avoided element: reason (*'aql*)." Some of them even said "the first, necessary condition of knowledge is doubt," and others that "fifty doubts are better than one certainty." For them, there was a sixth sense besides the usual five, namely, *'aql*, reason. They raised reason to a touchstone in matters of belief. One of their early representatives, Bishr ibn al-Mu'tamir of Baghdad, wrote a veritable paean to reason as part of a didactic poem of natural history: "How excellent is reason as a pilot and companion in good fortune and evil,/As a judge who can pass judgment over the invisible as if he saw it with his own eyes./One of its actions is that it distinguishes good and evil,/Through a possessor of powers whom God has singled out/With utter sanctification and purity."

The Mu'tazilites ruthlessly criticized popular superstitions, especially the mythological elements of eschatology, which they no longer considered a part of Muslim belief. They gave an allegorical explanation of the bridge *Sirat*, which one had to cross to get to the next world. They excised the Balance or scales in which the acts of man are weighed, and eliminated many other childish fantasies. But Muslims they remained.

Conclusion. Was Islam tolerant of heresy and unbelief? Certainly it was intolerant of unbelief. As T. P. Hughes's *Dictionary of Islam* tells us under the article "Sin," Muslim scholars held that there were seventeen great sins; at the top of the list, the number one sin was *Kufr*, or infidelity (in the sense of unbelief). Murder appeared well down the list in fifteenth place.

The situation undoubtedly varied from country to country, ruler to ruler, and period to period. In general, the Umayyads are seen as more tolerant than the later Abbasids, precisely because the Umayyads had not yet defined themselves as Muslims.

So long as one had royal patronage and protection in addition to talent, one could often get away with blasphemy, heresy, and even unbelief, at least for a time. For instance, the Barmakids, a Persian family, served several Abbasid caliphs as advisers though they were often accused of unbelief, or at least of secretly harboring anti-Islamic sentiments. When royal favor was withdrawn, this influential family fell from grace. An indication that heresy was otherwise little tolerated under Islam is the fact that plotters seeking to eliminate a rival often resorted to accusing their target of heresy. The fear of being labeled a heretic was pervasive. We might mention the constant persecution of the Ismailis, one hundred thousand of whom are said to have been exterminated by Abbas, lord of the city of al Rai, in the eleventh century.

Thus we have the spectacle of periodic persecution of various groups (Kharijites, Shiites, Ismailis, and so on) considered either doctrinally suspect or politically subversive. We see individual philosophers, poets, theologians, scientists, rationalists, dualists, freethinkers, and mystics imprisoned, tortured, crucified, mutilated, and hanged. Time after time their writings were burned, including those of AVERRÖES, Ibn Hazm, Al Ghazali, Al Haitham, and Al Kindi. Surely it is significant that none of the heretical works of Ibn Rawandi, Ibn Warraq, Ibn Al Muqaffa or Ar Razi has survived. Accused heretics were often forced to flee from one ruler to the domain of another, more tolerant ruler. Some were exiled or banished (for example, Averröes). Many were forced to disguise their true views and opinions by difficult or ambiguous language. Those who managed to get away with blasphemy were those who enjoyed the protection of the powerful and influential.

IBN WARRAQ

ITALY, UNBELIEF IN. The Middle Ages. With the collapse of the Roman Empire, the Italian provinces underwent a series of occupations and wars. Despite economic breakdown and what amounted to foreign control over the country, the region's system of written law and its Catholic religion survived, adopted by ruling classes

essentially foreign to the Roman culture. At the beginning of the second millennium, Italy joined in a general European process of economic and demographic growth; there, the flourishing of local communal polities and the rise of new and vital social groups was peculiar to Italy, at least to its northern and central regions. Southern Italy, conversely, remained a feudal society for a longer period; there, Emperor Frederick II Hohenstaufen headed an empire comprising Swabia and Sicily. Frederick's court was an island of unsurpassed freedom of thought where science and learning were protected. Therefore, Frederick was praised as the "wonder of the world" by his admirers and reviled by his critics as the Antichrist.

Criticism of papal temporal power and of the moral corruption of the clergy was a constant refrain of Italian heretical preachers, including the reformer Arnold of Brescia, who developed a religious doctrine of poverty in contrast with the opulence of the church; Brother Dolcino, who condemned clergy corruption and marked the Donation of Constantine as the moment when the church was handed over to Satan; and the Dominican monk Girolamo Savonarola. In literature, criticism of religion is evident in Giovanni Boccaccio, author of the *Decameron*, who also went so far as to write a rationalistic *Genealogy of the Pagan Gods*. Poggio Bracciolini's skeptical and sarcastic *Facetiae* (Witty Tales) presents both anticlerical and materialistic arguments. Centuries later, both were accused of having authored *De tribus impostoribus*, the anonymous atheist attack on Moses, Jesus, and Muhammad.

On the side of natural sciences, physician and philosopher Pietro d'Abano of the University of Padua was a pioneer in the study of anatomy, physiopathology, astronomy, and astrology. His heretical views included unbelief in divine providence and in miracles (he even denied physical resurrection, alleged cases of which he explained as merely apparent death followed by return to consciousness). He was sentenced to death but died in prison before execution. In 1327 Francesco Stabili (better known as Cecco d'Ascoli, from his native town) was burned at the stake in Florence for his research, notably about astrology.

The Renaissance. Italy is undoubtedly the country where Renaissance HUMANISM was born. Its celebration of human dignity, freedom, and reason arose primarily from the interest in ARISTOTLE—not in the corrupted version used by Thomas Aquinas to serve his theology, but rather the Aristotle of AVERRÖES, stressing the eternity of the world, a concept of the celestial spheres influencing earthly events that somehow displaced divine intervention, and the notion of a rational soul that downgraded theology in favor of rational inquiry. In the fourteenth and fifteenth centuries, this humanistic vision developed in two main ways, both of which were to challenge Christendom: the analytical and antimetaphysical study of nature as the "reign of humanity" (e.g., Marsilio Ficino's activity in the Platonic Academy in Florence), and the investigation into moral issues centered on a more humanistic view (see, for instance, Pico della Mirandola's *De hominis dignitate oratio*, dated 1486). Aside from these, ANTICLERICALISM continued to be a defining Italian trait—perhaps more so than the cultivation of heretical theological views—in particular since the time of Dante Alighieri.

The most inspired eulogy for the joy of living, as opposed to sacrifice and asceticism, was published in 1432 by the humanist Lorenzo Valla as *De voluptate* (On Pleasure). Valla had no later troubles with the Inquisition, in spite of his treatise *De libero arbitrio* (On Free Will) of 1439, which presented a rather agnostic longing for nature. This work would later influence Martin Luther and also Gottfried Wilhelm von LEIBNIZ in his *Theodicy*. On the other hand, Valla's debunking *De falso credita et ementita Constantini donatione declamatio* (Discourse on the Falsely Believed and Forged Donation of Constantine), published in 1444, caused him to be accused of heresy. The *Discourse* demonstrated that the emperor Constantine's supposed donation of the central Italian territories to the papacy was a medieval forgery. General acceptance of such a view would sap the foundation of the papacy's temporal power. Valla's action moved along other lines as well: historical and philological studies and religious and social criticism. In Renaissance literature, materialistic and antireligious stances are also shown in Pietro Aretino's comedies and in several of Niccolò Machiavelli's plays. Machiavelli went so far as to contend that church domination over society was the cause of the spread of irreligion through Italy.

Pietro Pomponazzi, a quintessential Renaissance scholar, studied medicine in Padua and later held the chair of moral philosophy at that university. Pomponazzi was skeptical of the immortality of the soul, a position based upon the more materialistic interpretations of Aristotle's writings. For his *Tractatus de immortalitate animae* (Treatise on the Immortality of the Soul) of 1516, and for having denounced the ignorance and superstition of the clergy, he was indicted and compelled to retract. His important treatise *De naturalium effectuum admirandorum causis sive de incantationibus* (On the Causes of Amazing Natural Effects, or on Incantations)—in which he criticized the belief in magic and miracles, though admitting astrology as a study of purely natural effects—was published in 1556, after his death. He has been considered an atheist by many, as has been Girolamo Cardano. Cardano, who also studied medicine in Padua, epitomizes the ideal of the Renaissance man: his writings deal with such diverse topics as algebra, astrology, medicine, and ethics, with a naturalistic and deterministic view of nature, and an unconventional new spirit in ethical and political matters; see, for instance, his 1562 *Encomium Neronis* (Encomium for Nero), praising the Roman emperor who had been the bête noire of Christianity. The lawyer and historian Francesco Guicciardini

held high political positions in the Florentine administration and even under Pope Clemens VII, a Medici. However, Guicciardini's skepticism (unlike that of Machiavelli and Vico) extended to any general body of rules that could govern politics and civil life, and this led him to a disenchanted view of political ethics: in his memoirs, he admitted to having been at the service of the papacy although hating the "wicked tyranny of the clerics."

The Counter-Reformation was a dark period in Italy, as it was everywhere else in Europe, despite the fact that few organized challenges to Catholic orthodoxy had emerged in Italy. Lutheranism initially found favor in Venice (where it was espoused by Pietro Carnesecchi), Ferrara and Mantua, Tuscany (espoused by Bernardino Ochino), then Naples and Sicily. Usually, dissidents such as Ochino, who disbelieved in the Trinity and in the divinity of Christ, were described as atheists. Aonio Paleario was prosecuted in Siena, but later lectured in Lucca and Milan. His *Indictment against the Popes of Rome* was found only years after his death at the stake.

Repression of heresy during this period was violent and uncompromising: The first edition of the church's Index of Prohibited Books (1564) condemned such masterpieces of Italian literature as Boccaccio's *Decameron* and Ludovico Ariosto's *Orlando Furioso*. In 1557 the philosopher Iacopo Aconcio had to flee to England after expressing sympathy toward the Lutheran and Waldensian reformations. Later, in 1565, he would write the *Satanae stratagemata* (The Stratagems of Satan) in defense of religious tolerance and against dogmatism.

The Averröistic school of the Padua University and the interest in natural sciences were to develop and spread through France through the influence of Giordano BRUNO, Giulio Cesare VANINI, and Campanella. To a certain extent their FREETHOUGHT can be considered less hesitant and cautious than that of the early seventeenth-century libertinism; even so, the history of Italian Renaissance humanism is strewn with censorship, indictment, and torture. Bernardino Telesio's *De rerum natura iuxta propria principia* (On the Nature of Things according to Its Own Principles; 1586) was condemned, albeit only ten years after publication. Telesio's disciple Tommaso Campanella, who championed a secular government in the utopian *La Città del Sole* (The City of the Sun) and a purely rational religion in his thirty-volume *Theology*—and who authored an *Apology of Galileo*—underwent unspeakable tortures during nearly thirty years of imprisonment and escaped a death sentence only by pretending insanity. Although not a declared atheist, Campanella promoted many naturalistic and rationalist concepts in his *Atheismus triumphatus* (Atheism Defeated) of 1631, though it was formally a defense of the Catholic faith. Even Bruno was condemned for a combination of reasons: his philosophy, though centered on the then-new Copernican cosmology, treated a wide range of subjects. Inherently blasphemous as his ideas on the deity, the Trinity, and the universe collided with fundamentals of Christian dogma, and defiant of the cosmological beliefs of the time, he also was an ill-tempered person who missed no occasion to denounce ignorance and authoritarianism. He well understood his divergence from the mainstream thought of the day: "that which others see from a distance, I leave behind" (from a sonnet in *On the Infinite Universe and Worlds*). A few years after Bruno's death, the former Carmelite Lucilio Vanini was tortured and put to death in Toulouse for having claimed unbelief in the immortal soul and in the divine origin of humanity, and for having praised Queen Nature in his naturalistic account of the world. However, executing precursors and heroes of a new world vision could not weaken progress: in 1609, the Copernican theory of 1543 having been condemned by Luther and John Calvin but not yet by the pope, Galileo GALILEI began to point his new telescope skyward.

The Seventeenth Century. Although a renowned group of French thinkers is commonly taken as the prime example of early seventeenth-century libertinism and religious skepticism, some notable Italian thinkers followed similar paths. Both Cartesianism (see DESCARTES, RÉNE) and the atomist thought of Pierre Gassendi spread through the peninsula, not only because of exceptional supporters like Campanella and Galileo, but also because Cartesianism and atomism suggested a criticism of authority more clearly than they did a threat to religious belief. Yet proponents of antiauthoritarianism, too, risked heavy sanctions: in 1634, one year after Galileo's censure, Campanella had to seek refuge in France, with the assistance of Gassendi himself. In the Republic of Venice, historian Paolo Sarpi, a friend of Galileo, championed religious independence against the papal interdict imposed on Venice in 1606. To a certain extent Sarpi expressed hostility toward dogmatic religion in general. Unsurprisingly, he was excommunicated. Cesare Cremonini, a commentator upon Aristotle's writings and a lecturer at Padua perhaps best known for his refusal to view Jupiter's satellites through Galileo's telescope, nonetheless supported separation between science and religion and believed in the mortality of the soul. He thus incurred an investigation by the Holy Office; fortunately the University of Padua was under Venetian rule at that time. French *libertine érudit* (learned libertine) Gabriel Naudé, who had attended Cremonini's teachings in Padua, wrote reports upon details of Italian unbelief, highlighting a notable distinction between those who could safely declare their skepticism or unbelief—even in Rome—by complying with exterior devotional requirements, and those who criticized the papacy in any way and were repressed. Naudé names the poets Boccaccio, Pietro Aretino, Nicolò Franco, and Marcello Palingenio; thinkers including Cardano and Bruno; and even the pope's physician, as Italians who were open unbelievers.

Two main historical upheavals distinguish seven-

teenth-century freethought from that of the preceding century: the growing challenge of the Reformation and the impact of the great geographical explorations. In the Italian peninsula, as in Spain, the Reformation's influence was minimal (see, for instance, the anti-Catholic libels of Calvinist Gregorio Leti); on the other hand, the study of distant civilizations and cultures enjoyed immense popularity among scholars. The first part of the seventeenth century saw the spreading of anti-Trinitarian and rationalistic literature, a flourishing of atomism, and the decay of scholastic Aristotelianism in the light of advances in biology, medicine, and astronomy. Adding to these the "discovery" of Far Eastern civilizations, notably that of China as described by Italian Jesuit scholars, offered a vivid example of an advanced and very ancient civilization devoid of any concept of salvation or of a personal deity.

Even the more mature learned libertinism of the second half of this century (that of Pierre BAYLE and Bernard Fontenelle) is rooted in the Italian humanist tradition, as depicted on the heading page of the Viennese edition of the *Theophrastus Redivivus* (1659): this anonymous text of almost certain French origin clearly shows the author to be indebted to Cardano, Pomponazzi, Giulio Cesare VANINI, and Jean Bodin.

The Eighteenth Century and the Enlightenment. Despite relatively wide circulation in manuscript, the Italian version of LUCRETIUS's *De Rerum Natura* by Alessandro Marchetti could only be printed in London, in 1717. Before that date, an attempt to publish it in Naples was blocked by the Inquisition, showing that educated Italians participated in the general cultural trends of Europe in the seventeenth and the eighteenth centuries, notably the process of transition from libertinism to Enlightenment (see ENLIGHTENMENT, UNBELIEF DURING THE). Thanks to more liberal administrations, Italian science flourished in several towns, with important contributions to astronomy, mathematics, and life sciences. Lorenzo Magalotti met British, Dutch, and French freethinkers in his travels through Europe. His *Lettere familiari contro l'ateismo* (Family Letters against Atheism), which circulated in manuscript at the beginning of the century, offers a formal defense of religion but actually champions science and atomism. Freethinker, Freemason, and former pastor Antonio Conti traveled through Europe, meeting Fréret, Boulainvilliers, Malebranche, Newton, and Leibniz. Again, Italian dissidents were more concerned with criticism of the church and attention to church-state relationships than with philosophical speculation. Historian Pietro Giannone was excommunicated in 1723 for his rationalistic religious ideas and for claiming that the church had always been a force for regression and obscurantism. After exile in Vienna and Geneva, he was lured into a trap in Italy, then jailed for the last twelve years of his life. His works, translated into many languages, were notably studied and appreciated by Montesquieu. Adalberto Radicati di Passerano had to flee to London because of his criticisms of the church, but after publishing antireligious libels there, he was expelled from England and repaired to the Netherlands. Economist and philosopher Antonio Genovesi, lecturer in ethics at the University of Naples, was censored by the Inquisition for his critical positions and had to resign. In 1766 the Holy Office put onto the Index Cesare Beccaria's *Of Crimes and Punishments*, a masterpiece that advanced an Enlightenment vision of a more humane judicial system and for the abolition of the death penalty and torture. Together with Beccaria, philosopher and economist Pietro Verri animated Milanese society in favor of Enlightenment ideas.

The *Risorgimento* and Italian Unity. The Kingdom of Italy's efforts to annex the papal states provoked fiery reaction from the church, indeed a genuine war against the whole of civil society. In 1864 Pius IX published his *Syllabus* of the errors of his time: naturalism, rationalism, liberalism, and any aggression against his temporal power were condemned. On the opposite side, the kingdom had enacted laws to secularize the country. Much credit goes to Camillo Cavour, who coined the famous separationist motto "a free Church in a free State." Eventually Piedmontese troops occupied what was left of the Papal States in Rome (1870) and put an end to the pope's temporal power. It is therefore not surprising that most of the leaders of the *Risorgimento* were anticlerical. Giuseppe Garibaldi, the "hero of two worlds," was a Freemason and the honorary president of freethought and atheist societies. His follower Alberto Mario also published anticlerical writings on ecclesiastical politics, as did economist Carlo Cattaneo, the most eminent follower of the Enlightenment in Italy. Patriot Aurelio Saffi, an associate of Mazzini and Carlo Pisacane, wrote polemical books espousing RATIONALISM and anti-Catholicism. The "Roman question" about what the status of the church would be in the new Italy was a central theme of the *Risorgimento*. For many, patriotic feelings virtually implied anticlericalism.

Other influences on freethought in this period included the politicians and writers Francesco Domenico Guerrazzi and Luigi Settembrini, anticlerical journalist Aurelio Bianchi Giovini, and the former priest Bertrando Spaventa, who published anti-Jesuit writings and championed secular public education. As a philosopher Spaventa opposed POSITIVISM, but he tried to demonstrate a secularist inclination in Italian philosophy. Pedagogue Pietro Siciliani proposed a humanistic model of education, open to science and free from religious indoctrination. Materialism and unbelief advanced thanks to Dutch physiologist and freethinker Jakob Moleschott, who taught in Italy for more than thirty years, and to radical politician and positivist historian Giuseppe Ferrari. In literature, materialistic and essentially atheistic traits can be seen in Giacomo Leopardi, one of the greatest authors of the time, from his juvenile but learned *Saggio sopra gli errori popolari degli antichi* (1815) to the pessimistic medita-

tions of the *Operette Morali* (Minor Works on Morality), which was placed on the Index in 1860. Caustic anticlerical poems appear in the works of Olindo Guerrini (known as Lorenzo Stecchetti), Cesare Pascarella, and Nobel laureate Giosué Carducci, a Freemason since 1865 and a prominent anticlerical; his *Hymn to Satan*, in which revolt against Christianity is seen as the essence of progress, earned him excommunication.

Among the political parties, an anticlerical inclination was mostly seen in the extreme left: in the Italian Republican Party with Arcangelo Ghisleri, Eugenio Chiesa, and positivist philosopher Giovanni Bovio; in the nineteenth-century Radical Party with Felice Cavallotti; and later in the Socialist Party with Andrea Costa. On the side of anarchism, Mikhail BAKUNIN lived in Italy between 1864 and 1867 and influenced Italian libertarian unbelief (see ANARCHISM AND UNBELIEF).

Organized unbelief in Italy was more political than philosophical in nature. Former priest Cristoforo Bonavino, known as Ausonio Franchi, founded the periodical *La Ragione* in 1854 and helped to form an early organized freethought movement, together with Mauro Macchi and Luigi Stefanoni. Stefanoni translated Ludwig BÜCHNER, founded the periodical *Il Libero Pensiero*, and published atheistic and virulently anticlerical writings as well as an imposing *Storia critica della superstizione* (Critical History of Superstition) in 1869. Other local freethought groups were headed by such leaders as Garibaldi, Bovio, and Cavallotti. Ghisleri and Moleschott were the first to contact the International Freethought Federation (IFF) in 1880. Italian representatives to that body later included such renowned personalities as Roberto Ardigò, the leading figure in Italian positivism; politician and sociologist Napoleone Colajanni; renowned psychiatrist and criminologist Cesare Lombroso; and poet and playwright Mario Rapisardi, translator into Italian of Lucretius and Percy Bysshe SHELLEY.

Anticlerical propaganda culminated in Italy in the second half of the century. In 1869 the deputy Giuseppe Ricciardi organized an "Anti-Council" in Naples, which openly opposed the First Vatican Council and summoned all "freethinkers of the civil world." More than sixty Italian members of the parliament, Freemasons, and freethinkers from twenty foreign countries contributed to this atheistic and anticlerical initiative. Starting in 1885, several Italian personalities (in addition to Ludwig Büchner, Charles BRADLAUGH, Ernst HAECKEL, Victor Hugo, Henrik Ibsen, Robert Green INGERSOLL, Ernest RENAN, Herbert SPENCER, Algernon Charles SWINBURNE, and many others) joined a fund-raising initiative to erect a statue in Rome's Campo de'Fiori, where Bruno had been burned. Other supporters included Ghisleri, Lombroso, Ardigò, Carducci, and the politicians Aurelio Saffi, Giuseppe Zanardelli, and Antonio Labriola. In 1889 this monument was dedicated. Bovio delivered an inauguration speech to a huge crowd, and Bruno became the symbol of Italian freethought that he remains today. Even so, the nineteenth century would end with a period of censorship and repression.

The Twentieth Century. At the beginning of the twentieth century, freethinkers' activities blossomed into the formation of cultural and social charities. The international freethought congress of 1904 was organized in Rome, chaired by Ghisleri and anthropologist Giuseppe Sergi, a supporter and translator into Italian of Ludwig Büchner, Haeckel, and Spencer. Among the foreign personalities who participated were Haeckel, Moncure CONWAY, and Francisco FERRER. In those years the anticlericalist and Masonic Grand Master Ernesto Nathan was mayor of Rome; the satirical magazine *L'Asino*, published by freethinker Guido Podrecca, reached a circulation of one hundred thousand. Even the early futurist movement had particular anticlerical leanings, stemming from its antitraditionalist stance. But organized rationalism and democracy at large would fall under fascist guns and batons. Soon after establishing his regime, Benito Mussolini, a former socialist leader and rationalist activist who had written an atheistic pamphlet, "*L'uomo e la divinità*" (Man and God), came to an agreement with the papacy and largely restored the fortunes of the church. On the opposite side, idealist philosopher and liberal senator Benedetto Croce headed the spare parliamentary opposition to Mussolini's 1929 Concordat, or pact, with the Vatican. His small 1945 essay in response to Bertrand RUSSELL's *Why I Am Not a Christian*, "*Perché non possiamo non dirci cristiani*" (Why We Cannot But Define Ourselves Christians) of 1945 has been a milestone on the subject of combining disbelief in Christian theology with an embrace of the "cultural values" of Christianity.

In 1931, only twelve university professors refused to pledge allegiance to the fascist regime; among them were Ernesto Buonaiuti, the excommunicated modernist historian of Christianity; philosopher Piero Martinetti, deeply religious but a critic of Catholicism; and Francesco Ruffini, lecturer on ecclesiastical law but an unsurpassed champion of separation of church and state and of freedom of thought. An isolated case is that of philosopher Giuseppe Rensi, whose criticism of the idea of God (*Apologia dell'ateismo*; 1925) conveyed a sort of "religious" ATHEISM reminiscent of Lucretius, Leopardi, and Shelley. Many other antifascist activists and authors were anticlerical or openly irreligious and denounced the Concordat regime, including historian Gaetano Salvemini, jurist Piero Calamandrei, and Antonio Gramsci, one of the leading personalities in the birth of the Italian Communist Party. In addition, several secularist authors and activists were part of the antifascist movement Giustizia e Libertà (Justice and Liberty), including Riccardo Bauer, Alessandro Galante Garrone, and, notably, Ernesto Rossi, who published many anticlerical books and articles.

After World War II. The 1929 pacts with the Vatican

were sanctioned in the Italian republican constitution of 1948. Movements to repeal the Concordat never achieved great popularity. Still, despite the persistent clerical privileges the Concordat engendered and a solidly pro-Catholic political majority, the secularization of Italian civil society proceeded rapidly, culminating in the 1970s with a vote in favor of abortion rights and divorce.

Religious arguments in contemporary Italy are viewed less as theological matters and more with regard to their political implications for the church, large political parties, ethnic minorities, and the like, and with regard to their significance in terms of basic social principles and human rights. Therefore, outside of the relatively minor anarchist and freethought movements, the key question of belief often remains a personal issue, even for many academics who openly declare their atheism. The controversial dismissal of philosopher Emanuele Severino from the Catholic University of Milan in 1969 and the later, analogous case of Luigi Lombardi Vallauri in 1997, turned on their unorthodox views about religion rather than on plain unbelief. A classical Enlightenment and Marxist critique of theism and of religions was proposed by Arturo Labriola, but only a few other philosophers challenged religious belief. Conspicuous among them are Franco Lombardi, who advanced an antimetaphysical view devoid of any theological vestiges; Guido Calogero, who in the 1950s revolted against Christianity's monopoly over the so-called values of our civilization; and Nicola Abbagnano, a liberal philosopher who promoted a "New Enlightenment" movement together with Ludovico Geymonat. Geymonat was a communist partisan, rationalist, and Marxist philosopher who held the first Italian chair of philosophy of science and made logical EMPIRICISM known in Italy. Giulio Preti offered an analysis of the relationships between religion, philosophical trends, and science in which he labeled AGNOSTICISM as inconsistent and instead advocated outright atheism.

In other areas, speculation on religious unbelief was often mixed with considerations of political, moral, or historical issues. Historian of Christianity Ambrogio Donini was a Communist senator and an illustrious freethinker. Cesare Musatti, father of the Italian psychoanalytical school, was openly atheistic and anticlerical; Marcello Craveri, author of a much translated *Life of Jesus* (1966), and philosopher Norberto Bobbio also deserve mention in this regard.

The profession of explicit unbelief is unusual in contemporary Italian society: public persons often dare only to define themselves as skeptical, as did the liberal intellectual Giuseppe Prezzolini, or to confess a sense of inferiority with regards to believers, as did writer and film director Pier Paolo Pasolini. It is therefore not atypical that playwright and Nobel laureate Dario Fo, though his works are strongly anticlerical and blasphemous, was married in Milan by the archbishop. Other renowned unbelievers were the writers Primo Levi and Italo Calvino. On the academic side, anthropologist Ida Magli, Nobel laureate neurobiologist Rita Levi-Montalcini, and, notably, astrophysicist Margherita Hack made public statements of their secularism and unbelief.

The Church of Rome has given Italian society little conceptual room for organized dissent, but has also given it a religion without passion—superficial, increasingly superstitious, and more preoccupied with pleasing the hierarchy than with clinging to dogmas. Today indifference and incredulity are widespread, but open profession of atheism is rare. It might be said that conformity matters more than convictions.

ROBERTO LA FERLA

JACOBI, FRIEDRICH HEINRICH (1743–1819), German philosophical writer. Friedrich Heinrich Jacobi was born in 1743 in Düsseldorf, Germany. Science, art, and religion enticed the reserved youngster. Jacobi's merchant father apprenticed him with a business at Frankfurt-am-Main in hope that he would devote his life to commerce, but also permitted him to study philosophy in Geneva, where he read Lesage, Jean-Jacques ROUSSEAU, and Bonnet. Abandoning hopes of a medical career, Jacobi returned to Düsseldorf and helped maintain the family business. Throughout his life, he remained concerned with the possibility of discovering theoretical and practical truth without compromising personal freedom.

After a surreptitious relationship with Anna Katharina Müller (a household servant who bore his illegitimate son), Jacobi married Elisabeth (Betty) von Clermont. Intellectual interests united the young couple. They established a cultural haven with Jacobi's brother, the poet Georg, and his half-sisters, Charlotte and Helene, at the family's country home in Pempelfort, which enjoyed visits by GOETHE, Denis DIDEROT, Friedrich von Humboldt, and Johann Gottfried von HERDER. The Spinozism Controversy (see CONTROVERSIES: SPINOZISM, ATHEISM, PANTHEISM) and the loss of a son undermined his health. In 1794 the French invasion forced the family to flee to Wandsbeck and later, to settle in Eutin. After brief forays into local politics, Jacobi devoted himself to philosophical study and writing.

Jacobi's novels and essays influenced many different members of the intellectual community, earning respect from fideists, idealists, and romantics. He questioned the adequacy of philosophy as a means of articulating human and divine existence, calling for a return to common sense and faith. Jacobi claimed that abstract speculation generated either SKEPTICISM or DETERMINISM, which led to ethical despair that could only be averted by belief in a personal, creative God.

As a writer, Jacobi developed primarily through his critiques of other thinkers. After examining Baruch SPINOZA's philosophy, he concluded that it threatened religion and freedom by promoting both the Enlightened "tyranny of understanding" (see ENLIGHTENMENT, UNBELIEF DURING THE) and the romantic "cult of nature." During the Spinozism Controversy, Jacobi criticized pantheism, ATHEISM, and rationalist metaphysics in the *Spinoza Letters* (1785), attacking Moses Mendelssohn as a representative of the Enlightenment and Herder as a representative of romanticism.

After studying David HUME and Immanuel KANT, Jacobi explained more precisely his rejection of abstract analysis in favor of common sense and belief. In *David Hume on Faith or Idealism and Realism* (1787), he addressed Hume's skepticism. Hume had claimed that external reality lacked objective justification and thus, that human activity depended on belief or custom. Jacobi replied that individual self-awareness provided subjective evidence for the coexistence of external things, other people, and a personal creator, thus revealing an immediate knowledge.

In his *David Hume*, Jacobi also considered Kant's transcendental idealism. Kant distinguished between sensibility and reason, claiming that the nonsensible objects of rational faith (God, freedom, and immortality) transcended knowledge. Jacobi thought Kant had produced a new skepticism, because the sensible objects of knowledge never compared to the ideals of reason. He rejected Kant's attempt to derive the content of rational faith from individual moral experience rather than from communal, historical religious experience.

For Jacobi, J. G. FICHTE's idealism exceeded Spinoza's materialism, Hume's skepticism, and Kant's transcendental idealism. During the Atheism Controversy he accused Fichte of egoistic NIHILISM in *Jacobi to Fichte* (1799), claiming that idealism reduced individual subjectivity to a formal ego and faith in a personal God to belief in an abstract moral principle. Later, he attacked Fichte's follower F. W. J. Schelling, thus instigating the Pantheism Controversy.

Jacobi communicated his nascent philosophy through hints, symbols, and allegories. His idiosyncratic use of terms such as REASON, faith, and knowledge was perplexing. According to Jacobi, two species of knowledge derived from two types of sensibility, or feeling. Sensation, which was mediated by conceptual analysis, generated discursive knowledge of nature. Reason provided immediate, nondiscursive knowledge of God, freedom, and spirit. Rational knowledge involved intuition of the primordial ideals: the True, the Good, and the Beautiful.

Jacobi's final years were quiet. After retiring in 1812, he supervised the publication of his collected works. Although he never recovered from the financial, physical, and emotional damage suffered during the Spinozism Controversy and the French invasion, he enjoyed relative comfort surrounded by a wide circle of family and admirers. In 1819 he died in Munich.

YOLANDA ESTES

JAMES, CHARLES LEIGH (1846–1911), scholar and anarchist. Considered the most profound scholar among American anarchists (see ANARCHISM AND UNBELIEF), Charles Leigh James was born October 23, 1846, at Baden-Baden, Germany. The son of an English novelist and diplomat, he traveled extensively and met noted intellectuals through his family. Raised an evangelical Anglican and sometimes privately tutored, he attended Cheltenham College from 1861 to 1863; in 1865 he moved permanently to Eau Claire, Wisconsin, where he became a journalist. In 1866 he and Ohio-born Maria Hoyt opened a grocery store. James was very active in the Free Religious Society of Eau Claire and lectured on temperance. Leading an 1885 laborers' strike, he raised funds for the destitute families, urging them to "avoid violence above all things." He compared marriage to

chattel slavery at age twenty-four, but we know little about Hoyt (see SEX RADICALISM AND UNBELIEF). The couple had three daughters by 1880, and in 1893 they married with a religious ceremony. James believed that not only Christians, but Hindus, Buddhists, or freethinkers could endeavor to become the "ideal self." Though he wrote a full-length world history covering the earliest known civilizations through his own day, only one part (on the French Revolution) became a book. His Shakespeare criticism was said to be of the highest quality, and his countless articles, letters, and poems appeared in leading anarchist journals.

James held that "possession is natural; that property, as distinguished from possession, is robbery; and that robbery is artificial, made possible only by government." He insisted that anarchism rests "on Induction, whose evidences are alike for all men, whatever dogmas they were taught to believe." He viewed the belief in government as a superstition that would become, "like the belief in witchcraft, an object of general ridicule." His inductive method examined the problems of war, religion, morals, and aesthetics. In scientific debates, he defended vivisection and vaccination.

"Eau Claire's only anarchist" seems not to have traveled outside of the Midwest once he'd settled down. He died June 3, 1911, of heart disease and was warmly eulogized.

ROBERT P. HELMS

JAMES, C. L. R. (1901–1989), political theorist and humanist. Cyril Lionel Robert James was one of the most brilliant and original Marxist theorists of the twentieth century (see MARXISM). Moreover, he excelled in other areas, including sports writing, literary criticism, cultural criticism, and history.

James was born in Port of Spain, Trinidad. When he was a young boy, he loved cricket, watching and playing the game. His study of cricket enabled him to make profound observations on race, class, power, culture, the relationship between the individual and society, and life in general.

James also studied the works of Aeschylus, Shakespeare (see SHAKESPEARE, RELIGIOUS SKEPTICISM IN), William Thackeray, Fyodor Dostoyevsky, Lev TOLSTOY, and other great writers. Furthermore, his father, a teacher, often welcomed Hubert Alfonso Nurse as a houseguest; Nurse was the father of Malcolm Nurse, who, as George Padmore, would become a leader of the Pan-Africanist movement, which held that people of African descent are united by ancestry, culture, history, and destiny. James's father and the elder Nurse often discussed Pan-Africanism, influencing the younger James.

James's parents were devout Anglicans, and James embraced religion during his youth. When he was about twenty-one, however, he started reading books by rationalists (see RATIONALISM). By about age twenty-three, he was highly skeptical of Christianity and placed a high value upon reason instead of faith.

James spoke to a Roman Catholic friend about his doubts. The friend suggested that James share his views with a priest. James did so, but the priest essentially told him that he had to accept theism on faith. James was unimpressed with the priest's answer and shared his doubts with a Protestant minister. James was surprised when the Protestant minister gave him a similar response.

At twenty-four, teaching in Queen's Royal College, James rejected Christianity completely. He came to the conclusion that God is a concept created by human beings. Rejecting theism, he embraced a non-religious worldview, became an agnostic (see AGNOSTICISM), and never looked back.

At age thirty-one James sailed to England. He wrote newspaper articles on cricket, embraced Marxism, and thought profoundly about politics and culture. He became a member of the Independent Labour Party and eventually joined the Trotskyist movement.

James's most popular book is *The Black Jacobins: Toussaint L'Overture and the San Domingo Revolution.* In this work, James examined the Haitian rebellion from a Marxist perspective. Some of his critics believed he focused on class while giving short shrift to the subject of race. However, *Black Jacobins* is considered to be a classic among Marxists and Afrocentrists alike.

In 1935, with the blessing of the pope, Italy invaded Ethiopia. As a result, James began to focus more sharply on trying to meld Marxism and Pan-Africanism into a unified theory of human liberation. He saw no contradiction between the two, though many black nationalists thought Marxism could not adequately address the needs of people of African descent. On the other hand, many Marxists saw African nationalism as shortsighted and a threat to working-class unity.

In 1938 James focused on economic developments in the United States. He believed the American people were waking up to the need for government action in improving the lives of citizens. On the other hand, after Adolf Hitler and Joseph Stalin signed a 1940 unity agreement, James became increasingly critical of Trotskyism.

By 1941 he had left the Socialist Workers Party and

formed the Johnson-Forest Tendency. James and the other members of this group drew upon Marxism and Hegel's dialectical materialism in an effort to formulate a progressive vision for society.

James spent fifteen years in the United States, during which time he produced what he and others considered some of the most intellectually stimulating work of his life. Offering penetrating insights into popular US culture, he demonstrated great respect for the cultural contributions of ordinary people.

James's American wife, the writer and political activist Constance Webb, had a great impact upon his thinking. He credited her with bringing about much of his intellectual creativity. She was one of the most influential members of the Johnson-Forest Tendency. The couple had a son together. However, the US government eventually planned to have James deported, and he returned to England alone.

Today the James legacy is kept alive in New York City at the C. L. R James Institute. Its web site features articles, essays, speeches, books, photos, and other information on the life and thought of C. L. R. James.

NORM R. ALLEN JR.

JEFFERSON, THOMAS (1743–1826), American statesman. Our certain knowledge concerning Thomas Jefferson's opinions on religion is limited by our awareness of three constraints: (1) He was a man of extreme reticence and reserve, with many good (and some less admirable) reasons for safeguarding his privacy. (2) He lived in a period during which the natural sciences were in the ascendant, but also at a time when the revelation (if that should be the right term) of Darwinism (see DARWINISM AND UNBELIEF) was still a few decades in the future. (Charles DARWIN was born on the very same day as Abraham Lincoln: history may well judge which of the two men was the greatest emancipator, but both of them had to attend to important business which Mr. Jefferson had left unfinished.) (3) He was a man of very strongly marked contradiction, both in his public and his private life.

With these limitations to our inquiry fully admitted, it is nonetheless permissible to infer that the third President of the United States and author of its Declaration of Independence had at least conducted a flirtation with ATHEISM, had a strong dislike of organized religion if not for religion itself (see ANTICLERICALISM), and believed that wherever the truth might lie, it did not lie with any religious establishment and could only be properly explored in a society that observed a strict boundary between church and state.

The likeliest and most logical explanation of all these opinions and contradictions may be the simplest one: Jefferson was a "deist" (see DEISM). In other words, and like many thoughtful men of his day, he believed that the observable order of nature and of the universe argued for an author or "designer," but he could not be persuaded that (a) this author or designer's wishes could be known, still less made known, to his creatures or (b) that any divine wishes or further interventions were necessarily involved. On one point we can be certain: at no stage of his life does Jefferson appear to have believed that any priesthood could hold the key to this mystery.

Not unlike William Paley, founder of the simplistic "Natural Theology" (see EVOLUTION AND UNBELIEF), Jefferson was fond of the analogy of the timepiece: a work that not even a primitive human, ignorant of its purpose, could confuse with a rock or a vegetable. He compared his own body to a watch, and indeed observed dryly in old age that its springs and wheels appeared to be wearing out. But how can "design" encompass the idea of innate breakdown and failure? The same paradox is evident in Jefferson's own reflections on evil and injustice: in discussing the great stain of slavery he observed: "I tremble for my country when I reflect that God is just," and, less famously, commented on the one-vote defeat of an antislavery resolution that "Heaven was silent in that awful moment." Biblically derived rhetoric was universal in that period, and Jefferson was not exempt from the requirement to address an audience which often knew only one book, so that his resort to such tropes is no great wonder. (The two uses of the word "creator" and "created," in the preamble to the Declaration of Independence, are an obvious example. Though the meaning of "equality" and "rights" would be unaffected by the absence of any such references, the new nation was clearly not going to begin by addressing a divided American people in secular, let alone in agnostic or atheist tones.)

However, he was not of a mind to be content with any idea of god taking any side, let alone the just one. Or else what would be the need for the Enlightenment and the science of which he was such a student? (see ENLIGHTENMENT, UNBELIEF DURING THE). In a letter to his nephew Peter Carr, written from Paris 1787 and suggesting a course of education, he wrote: "Fix reason firmly in her

seat, and call to her tribunal every fact, every opinion. Question with boldness even the existence of a God; because, if there be one, he must more approve of the homage of reason, than of blindfolded fear. . . . Do not be frightened from this inquiry by any fear of its consequences. If it ends in a belief that there is no God, you will find incitements to virtue in the comforts and pleasantness you feel in its exercise, and the love of others it will procure you. If you find reason to believe there is a God, a consciousness that you are acting under his eye, and that he approves you, will be a vast additional incitement; if that there be a future state, the hope of a happy existence in that increases the appetite to deserve it; if that Jesus was also a God, you will be comforted by a belief of his aid and love."

This letter is of considerable interest, because it is one that Jefferson can never have expected anyone else to read, and because it both demonstrates his own open-mindedness and proves that he had, at least for a time, steadily contemplated the idea of a godless world. In many ways, and in other paragraphs, it also anticipates his own much later edition of the New Testament (commonly called "The Jefferson Bible," and a manual for Unitarians (see UNITARIANISM TO 1961) in which he firmly repudiated the idea of the divinity of Jesus. But that text, too, was never intended to be read by others in the course of Jefferson's lifetime.

However ambivalently we may have to "read" Jefferson on the numinous and the supernatural, we are freed from this encumbrance when it comes to the church, or the churches. It is rare indeed to find him using the word "priest" or "monk" without some terse allusion to "superstition" or "witchcraft." Of the only three achievements that he thought worthy of mention on his memorial obelisk (which was uninscribed with any devotional words about faith or the hereafter) the two besides his authorship of the Declaration of Independence were the foundation of the University of Virginia and the sponsorship of the Virginia Statute on Religious Freedom. The university was the first secular campus in America and the only one not to endow a chair of theology, and the Statute is, in all its essentials, the cornerstone of the First Amendment to the United States Constitution.

Jefferson was much attacked for his laconic but deliberate remark that "it does me no injury for my neighbor to say that there are twenty gods, or no god. It neither picks my pocket nor breaks my leg." But more important was the legal "rider" that he attached to this seemingly uncontroversial proposition: Injury could indeed by done by those who expected their belief to enjoy the sanction and protection of law. Jefferson's Virginia Statute on Religious Freedom set out to ensure that no faith or congregation could expect any means of support beyond itself. It is important to bear in mind that, at the time, the constitution of Massachusetts extended "equal protection," and the right to hold office, only to "Christians" and only to those Christians who had abjured the pope. In New York, equality was likewise denied to Catholics but permitted to Jews. In Maryland, the position was the exact obverse. Delaware demanded that its officeholders bear witness to their belief in the Trinity, while in South Carolina it was declared that the official religion was simply "Protestantism." Only in Virginia, at first, was it suggested that the state's tithes and taxes underwrite no sect or faith.

In order for this bill to pass, it may not be too fanciful to imagine, its 1779 preamble had to contain some ostensibly devotional rhetoric: "Well aware that Almighty God hath created the mind free; that all attempts to influence it by temporal punishments or burdens, or by civil incapacitations, tend only to beget habits of hypocrisy and meanness, and are a departure from the plan of the Holy Author of our religion, who being Lord both of body and mind, yet chose not to propagate it by coercions on either, as it was in his Almighty power to do; that the impious presumptions of legislators and rulers, civil as well as ecclesiastical, who, being themselves but fallible and uninspired men have assumed dominion over the faith of others, setting up their own opinions and modes of thinking as the only true and infallible, and as such endeavoring to impose them on others, hath established and maintained false religions over the greater part of the world and through all time."

The stress, here, may be laid on the fourth and fifth words "Almighty God," which perform something of the same function that the two words "their Creator" fulfill in the Declaration of Independence. A general reference to a higher power may sometimes have the effect of irritating true believers, who insist on something more specific to their own creed. It was proposed that the words "Almighty God" be removed and replaced with "Jesus Christ." This crude tactic, which was defeated by a surprisingly large majority, allowed Jefferson to claim "proof that they meant to comprehend, within the mantle of its protection, the Jew and the Gentile, the Christian and Mahomedan, the Hindoo, and infidel of every denomination." In that sense, it might be argued, he had subtly employed the zeal of the faithful, as well as their rhetoric, against the faithful themselves. And, since he showed tactical genius and skill at compromise throughout his political life, there is no reason for us to suppose that he was not playing the same hand on this occasion, too.

It needs to be added that Jefferson, in defending his Bill, laid stress on the ways in which the state could corrupt the churches (by means of pelf and preferment) as well as the other way around. But his private conviction may be better illustrated by his view that "our civil rights have no dependence on our religious opinions, any more than our opinions in physics or geometry." The latter two instances are perhaps significant. Jefferson was a friend to science and a believer in the Enlightenment, and he helped advance the idea of vaccination against smallpox, for example, at a time when that leading Yale divine Dr.

Timothy Dwight was denouncing injection as a profane interference with god's design. However, there were other men of science and enlightenment, such as Dr. Benjamin Rush, whose Christianity was unshakeable. (Rush even dropped his friendship with Thomas PAINE after the latter published *The Age of Reason*: it may or may not be suggestive that Jefferson never disowned Paine, even in adversity.)

His later time in office, as successively minister to Paris, Secretary of State, Vice President and (twice) President does not allow a very minute insight into his private opinions. We know that Jefferson made a point of attending divine service as occasion required, just as we know that when his daughter wanted to become a nun, he drove straight to the school in Paris where she had acquired the idea and removed her from the establishment that very day. It was, however, while he was in his first term as President, on New Year's Day, 1802, that he took the opportunity of replying to an address from the Baptist Association of Danbury, Connecticut. After some opening courtesies, he wrote: "Believing with you that religion is a matter which lies solely between man and his God, that he owes account to none other for his faith or his worship, that the legislative powers of government reach actions only, and not opinions, I contemplate with sovereign reverence that act of the whole American people which declared that their legislature should 'make no law respecting an establishment of religion, or prohibiting the free exercise thereof,' thus building a wall of separation between Church and State."

There seems no reason to doubt that this wall also enclosed, in his mind at least, the rights of those who professed no religion of any kind. Nor can the Framers of a constitution that deliberately eschewed all mention of a deity have intended any other outcome.

When, in retirement at Monticello, Jefferson took up a task that he had actually begun while in the White House, and decided to revise the New Testament by purging it of all magical and absurd and superstitious accretions, he seems to have felt a sense of mission that was part secular and part devotional. To renew attention to the teachings and precepts of a good man was, he felt, to define himself as a true "Christian" in the sense that one might now call oneself a Spinozist (see SPINOZA, BARUCH) or Darwinian: in other words, to affirm the teachings of a teacher without having to worship him in any extravagant manner. This—the repudiation of Trinitarian casuistry and the focus on the individual human—had in his mind the additional advantage of putting the priests out of a job, because what could be plainly understood "would not answer their purpose," since "their security is in their faculty of shedding darkness." This form of Unitarianism, he wrongly believed, would soon win a majority simply by its appeal to reason.

As death approached, and as he continued to suffer at the thought of his wife and two of his daughters having predeceased him, Jefferson may have allowed himself and his surviving daughter a few moments of emotion on their behalves, and even the yearning for a reunion beyond the grave. But his last public letter was a blast against "monkish ignorance and superstition," and he repeatedly confronted the inevitable by telling friends that he did so with neither "fear" nor "hope." In words that might have appealed to any freethinker, he informed one of the many who tried to coax him into confession or allegiance that: "I am of a sect by myself." This statement may not allow him to be annexed by the materialist camp, but it keeps him from the clutches of all who prefer faith to reason.

CHRISTOPHER HITCHENS

JESUS, HISTORICITY OF. Denying Jesus's historicity means asserting that Christianity is based on a founder figure who is wholly mythical. This was the position argued by Bruno BAUER in in 1850 and later; he was supported at the turn of the century by Arthur Drews in Germany, William Benjamin Smith in America, and John M. ROBERTSON in England, among others, in a fierce debate on the subject that was not without some impact even on Christian scholars. Thus in chapters added to the second (1913) German edition of his famous history of life-of-Jesus research, Albert Schweitzer allowed that Christianity must reckon with the possibility that it will have to surrender the historicity of Jesus altogether, and must have, in readiness for such a contingency, a metaphysical basis for its beliefs.

However, Robertson and the others of that time made the mistakes of setting aside as interpolations all New Testament passages they found inconvenient, and of trying to explain Jesus away in terms of pagan parallels (as simply another Osiris or Hercules), when the Jewish background is clearly of greater importance. As a result, by around 1920 nearly all scholars had come to regard the case against Jesus's historicity as totally discredited; since then, attempts to reopen the discussion have met with the response that *that* battle has been fought and won by the apologists, and that it would be otiose to fight it all again.

Today, most secular scholars accept Jesus as a historical, although unimpressive, figure. They are aware that much that is said of him, and by him, in the New Testament is no longer taken at face value even by scholars within the mainstream churches, who either discount much of its material as inauthentic, or justify it by more novel interpretations. However, from about 1960 an increasing number of skeptics have come forward with denials of Jesus's historicity. In my first books on Christian origins, I myself denied it, but in works published since 1995 I am not quite as radical, although I still go further than critical Christian scholars in that I regard even the Jerusalem Passion and execution under Pilate as non historical, and am concerned to argue that case here. The more radical view that there was no historical Jesus

at all is still vigorously defended by a few scholars, notably Earl Doherty and Robert M. Price.

The starting point for any questioning of Jesus's historicity must be the observation that the earliest extant Christian documents do not confirm the portraits of him given in the canonical gospels. These latter, widely agreed to have been written between 70 and 100 CE, and not by eyewitnesses of the events portrayed in them, depict Jesus as a teacher and miracle worker in Galilee early in the first century who died in Jerusalem at the behest of the Roman governor Pontius Pilate. But none of these supposedly historical events are mentioned in extant Christian documents that are either earlier than the gospels or are early enough to have been written independently of the gospels—that is, before the gospels, or the traditions underlying them, had become generally known in Christian circles.

The discrepancy is particularly striking when behavior or teaching recorded in the gospels has obvious relevance to the concerns of the earlier authors. Some scholars have frankly called it baffling that Paul, writing substantial epistles in the 50s—they include Romans, 1 and 2 Corinthians, Galatians, and Philippians—fails to refer to the teachings and actions of Jesus, particularly at points where he could have clinched his arguments by doing so. For instance, one of the major issues confronting him was: Should Christians be required to keep the Jewish law? One would never suppose, from what Paul says, that Jesus had views on this matter—as, according to the gospels, he had. Again, is Jesus's second coming, which will bring the world to an end, imminent? And will it be preceded by obvious catastrophes, or occur without warning? On these points, 2 Thessalonians (probably a little later than Paul, although it claims to be his writing) contradicts the genuinely Pauline 1 Thessalonians, but neither appeals to any teachings such as those detailed in the gospels. This is very hard to understand if Jesus had in fact spoken of these things only a decade or two earlier.

Paul tells his readers to "bless those that persecute you," bids them "judge not," and urges them to "pay taxes." Surely in such instances he might reasonably be expected to have invoked Jesuine authority, *had he known* that Jesus had taught the very same doctrines. It seems likely that certain precepts concerning forgiveness and civil obedience were originally urged independently of Jesus, and only later put into his mouth and thereby stamped with his supreme authority. This is more probable than that Jesus really gave such rulings but was not credited with having done so by Paul, nor indeed by Christian epistle writers of the following generation, for they write of his earthly life in much the same vague way.

This early post-Pauline material is substantial, comprising three of the letters falsely ascribed to Paul in the canon (2 Thessalonians, Colossians and Ephesians) and also the letter to the Hebrews, the epistle of James, the first epistle of Peter, the three epistles of John, and the book of Revelation. These writings are dated between 70 and 95 CE (that is, within the period when the gospels were being written). Nevertheless, although most of them stress one or more of Jesus's supernatural aspects (his existence before his life on earth, his resurrection, and second coming), they do not ascribe to him the teachings or miracles attributed to him in the gospels; most strangely, they give no historical setting to the crucifixion, the only episode Jesus's incarnate life which they see fit to mention at all. This suggests that there was an interval before the biographical material of the gospels became generally known and widely accepted in Christian circles. That older Christologies should have persisted in some quarters while newer ones were emerging in others is hardly a matter for surprise.

There is, then, a disparity between all these documents and the gospels which cannot readily be discounted. It is perverse when many scholars reduce the whole problem—if indeed they acknowledge it at all—to the silences of Paul, when so many others are equally silent about matters which, had they known of them, they could not but have regarded as important.

General Characteristics of the Early Material. The most striking feature of the early documents is that they do not set Jesus's life in a specific historical situation. Not only are there no parables nor miracles, but also no Galilean ministry, nor Passion in Jerusalem, indeed no indication of time, place, or attendant circumstances at all. The words Calvary, Bethlehem, Nazareth, and Galilee never appear, and the word Jerusalem is never used in connection with Jesus, who figures as a basically supernatural personage who took human form, "emptied" then of his supernatural powers (Phil. 2:7)—certainly he is not portrayed as the gospel figure who worked wonders that made him famous throughout "all Syria" (Matt. 4:24). He was indeed crucified for our redemption, yet the Passion is not as in the gospels. In Paul, for instance, there is no cleansing of the temple (which, according to Mark and Luke, was the event that triggered the resolve of the chief priests and scribes to kill Jesus), no conflict with the authorities, no Gethsemane scene, no thieves crucified with Jesus, no weeping women, no word about the place or time, and no mention of Judas or Pilate.

Paul's colorless references to the crucifixion might be accepted as unproblematic if it were unimportant for him. But he himself declares it to be the very substance of his preaching (1 Cor. 1:23 and 2:2). Yet he lived as a Christian for three years before even briefly visiting Jerusalem (Gal. 1:17f.), and says nothing that would indicate that he took interest in, or even had awareness of, holy places there.

Assuming human form brought Christ into the domain of the *archontes*, the "rulers" of this world, the evil angelical powers variously designated in the early documents as the world's "elements" (Gal. 4:3, 9) and as authorities, powers, thrones, dominions, principalities (Rom. 8:38;

Cols. 1:16; 2:10, 15). It was these "rulers" who, according to Paul (1 Cor. 2:8), effected the Lord's crucifixion. Kittel's standard *Theological Dictionary of the New Testament* observes that Paul is not here referring to earthly authorities—and so certainly not to Caiaphas and Pilate—and that arguments to the contrary are "not convincing." Colossians (2:15) likewise seems to place the event in a supernatural milieu. Ephesians mentions (2:2) "the prince [*archon*] of the power of the air" to whom the recipients of the epistle used to be beholden, and declares that "our wrestling is not against flesh and blood, but against the principalities, against the powers, against the world-rulers of this darkness, against the spiritual hosts of wickedness in the heavenly places" (6:12). Such passages betray that early Christians conceived the present world order to be under the control of supernatural beings whose power Christ was bringing to an end (1 Cor. 2:6).

Jesus's resurrection was of course as important as his crucifixion. Paul describes himself as "called to be an apostle" (Rom. 1:1) since he had seen the risen Lord and on this basis had entered into his service (1 Cor. 9:1). No one in these letters is called a "disciple" (a personal acquaintance of the earthly Jesus). The word used is "apostle," and it here means no more than Christian missionary.

Paul does not even commit himself unambiguously to designating Jesus's death, burial, and resurrection as recent events. He specifies eyewitnesses of the appearances of the risen Lord (including himself), and stresses that most of these persons are still alive, thus stamping the appearances as recent, but not the death, burial, and prompt resurrection (three days after the death), which he merely says occurred "in accordance with the scriptures" (1 Cor. 15:3–8). This does not mean the gospels, which did not then exist, but the sacred books of the Jews. These appearances of the risen Lord convinced him that the general resurrection of the dead, already heralded by Christ's resurrection (1 Cor. 15:20), and the final judgment of both living and dead, were imminent. Now that Christ was not only risen, but had also begun to manifest himself from heaven, these final events could not be long delayed.

There are admittedly a few statements in Paul's letters which, if read in the light of prior knowledge of the gospels, can be taken to imply that he knew of Jesus's ministry as depicted there. For instance, on one occasion Paul uncharacteristically appeals to the authority of "the Lord" to support an ethical teaching (on divorce: 1 Cor. 7:10). It is, however, not necessary to suppose that he believed the doctrine to have been taught by the historical (as opposed to the risen) Lord; for, as M. E. Boring and others have shown, in Paul's day Christian prophets gave directives in the name of the risen one as the obvious way of supporting rulings of their own that they wished to inculcate. At a later stage it would naturally be supposed that Jesus must have said in his lifetime what the risen Lord had said through his prophets; and so the doctrine came to be put into the mouth of the earthly Jesus and recorded as such by evangelists.

That Paul received communications from the risen Lord is beyond doubt. He expressly records (2 Cor. 12:9) what the Lord had said personally to him in answer to a prayer; and the speaker can only have been the risen Lord, for Paul did not know Jesus before his resurrection, and as a Pharisaic persecutor of Christians, certainly did not then pray to him. The early documents reiterate the importance at that time of Christian prophets as spokesmen of the Spirit. In church, says Paul, "two or three prophets" may speak, while others "weigh what is said"; and "if a revelation is made to another sitting by," then the first should be silent, "for you can all prophesy, one by one" (1 Cor. 14:28–31). He repeatedly speaks of "revelations" which he himself felt impelled to pass on to the community (1 Cor. 2:13; 7:40; 14:37). Other early documents show how widespread the phenomenon was. Ephesians tells of what "has now been revealed to Christ's holy apostles and prophets by the Spirit" (3:5). The book of Revelation refers to prophets as integral to the church (22:9), and delivers *logia*, sayings of the risen Lord, through his spokesman, the author (22:16 and 20).

The first Christian epistles that depict Jesus in a way that significantly resembles to gospel portrayals are some of those which are agreed to have been written circa 90–110 CE; namely the three so-called pastoral epistles (1 and 2 Timothy and Titus, ascribed to Paul in the canon but generally admitted to be from a later hand), 2 Peter (widely regarded as the very latest book in the canonical collection), and, outside the canon, the anonymous letter known as 1 Clement and the seven letters of Ignatius of Antioch. Since, then, all these do give biographical references to Jesus, it cannot be argued that epistle writers generally were disinterested in them, and it becomes necessary to account for the fact that only the earlier ones give the historical Jesus such short shrift.

Jewish Wisdom Literature. The religion of one day is often largely a reshuffling of ideas of a yesterday, and since Christianity emerged from Judaism, it is there that we must look for its most significant antecedents. Jewish Wisdom traditions are here relevant. Wisdom is a primordial feminine being who (in the book of the Wis. 9:4) sits beside God's throne as his consort and participates with him in the creation of the world (Prov. 3:19 and 8:22–31). When she sought an abode on earth, mankind refused to accept her, whereupon she returned in despair to heaven (1 Enoch 42:1f.). This figure of Wisdom, though feminine, greatly influenced Christian thinking about Jesus. The "Christology of pre-existence and incarnation" (according to which Christ existed in heaven before his birth on earth) is—in the wording of Metzger and Coogan's handbook—generally agreed to have "developed from the identification of Jesus with the wisdom of God."

The gender problem already exercised pre-Christian Jews. For Philo, the Jewish sage of Alexandria who died

circa 50 CE, although Wisdom's Greek name is feminine her nature is masculine, and she is called feminine only to indicate her inferiority to the masculine maker of the universe. Philo made her almost synonymous with the "Word," the masculine Logos, the highest of God's "powers," which function sometimes as aspects of him and sometimes independently of him. By the time we reach the prologue of the fourth gospel, the masculine Logos had come to be established as a designation of the supernatural figure so close to God. Nevertheless, virtually everything said of the Logos here had already been predicated of Wisdom in Judaism.

That Jewish Wisdom ideas influenced early Christian writings is undeniable, for Jewish statements made about Wisdom are there made of Jesus. Christ is called "the power of God and the wisdom of God" (1 Cor. 1:24); in him are "hidden all the treasures of wisdom and knowledge" (Cols. 2:3). Like Wisdom, Christ assisted God in the creation of all things (1 Cor. 8:6)—an idea spelled out in the Christological hymn of Colossians 1:15–20. And like the Jewish Wisdom figure, Jesus sought acceptance on earth but was rejected and returned to heaven. Furthermore, in the Wisdom of Solomon, the righteous man, Wisdom's ideal representative (no particular person is meant), is persecuted but vindicated post mortem. His enemies have condemned him to "a shameful death" (2:20), but he then confronts them as their judge in heaven, where he is "counted among the sons of God" (5:5). Cognate is the martyrological book 2 Maccabees, with its belief in the resurrection of the faithful; also, 4 Maccabees adds to this the idea that someone steadfast in the faith can benefit others, because God will regard his death as a "ransom" for their lives, as an expiation for their sins (6:28f.; 17:21f.). That a martyr's death could function as an atoning sacrifice, to be followed by his immortality, was, then, an idea not unfamiliar in the Hellenistic environment of early Christianity.

Transition to the Gospels. It is, however, difficult to believe that the gospel Jesus is no more than an expansion and elaboration of the obscure Jesus of the early Christian documents. The gospel traditions are too complex and too specific in their references to time and place to have developed within a short time from no other basis. Accordingly, some elements in the Galilean ministry can be better understood as traceable to the activity of a Galilean preacher of the early first century, who figures in what is known as Q (an abbreviation for *Quelle*, German for "source") which can be reconstructed from what is common to the Gospels of Matthew and Luke, yet does not derive from Mark's gospel (from which they also, again independently of each other, drew). Q consists mainly of Jesus's sayings. Doherty and Price have (quite impressively) argued that these were originally anonymous, Jesus being introduced as their speaker only at a relatively late stage in the development of the material. But most scholars regard them as deriving from a single historical figure—a view which I myself accept.

As Tuckett observes, Q is widely held to have originated in northern Galilee or nearby, circa 40–70 CE. It assigns Galilean localities to Jesus's activities and links him with John the Baptist, known from the Jewish historian Josephus to have been executed before 39 CE. It never calls Jesus "Christ," nor does it identify him with Wisdom, but represents both him and the Baptist as human messengers sent by Wisdom to preach the need for repentance before the imminent arrival of a supernatural figure, "the Son of man," who will effect a terrible and final judgment. Q has no Passion narrative, and does no more than hint that the hostility Jesus met with—in the Deuteronomic tradition of rejection of prophets—may have led to his being killed. His death is certainly not regarded as redemptive, nor is there mention of his resurrection. This human Jesus is, then, in so many respects different from the redeeming Pauline Christ of no specified time and place that the two must surely have separate origins.

Already in Mark, the oldest extant gospel, there are Q-type traditions; and in all four gospels the two Jesus figures have been to a large extent fused into one. The Galilean preacher of Q has been given a salvific death and resurrection, and these have been set in a historical context consonant with the Galilean preaching. As Bultmann observed, Mark's purpose was "the *union of the Hellenistic kerygma* [preaching] *about* Christ, whose essential content consists of the Christ-myth as we learn it in Paul, . . . with the *tradition of the story of Jesus*."

This novel synthesis may well not have immediately appealed to all Christian communities, even if we assume that communication between them was such that they all knew of it. Hence it is not surprising that some of the epistles written circa 90 CE continued, as we have seen, to proclaim the earlier, Pauline view of Jesus.

Other factors apart from Q will have prompted the assigning of Jesus's life to the early first century. The evangelists will have known that Paul and his fellow apostles experienced their visions of the risen Jesus about the year 30; and so they naturally assumed that the crucifixion and resurrection had occurred shortly before. This would seem plausible enough to evangelists writing outside Palestine, after earlier events there had been obscured from view by that country's devastating war with Rome from 66 CE. It was also easier to cope with gnostic Christologies, which described Jesus's redemptive work in mystical terms, if he could confidently be placed in definite historical circumstances. It was in order to confute such deviationists that Ignatius of Antioch—the earliest Christian writer outside the canon to link Jesus with Pilate—insisted that Jesus was truly born from a human mother, the virgin Mary; that he was dependent on food and drink like any other man; and was truly "nailed to the cross" in the days of "Pontius Pilate and Herod the Tetrarch."

Once Pilate had been introduced to give the cruci-

fixion a historical setting, the rest of the gospels' Passion narrative was prompted by musing on what was taken for prophecy in the Old Testament. As Helmut Koester puts it, "the details and individual scenes of the narrative do not rest on historical memory, but were developed on the basis of allegorical interpretation of Scripture."

None of this implies conscious fraud. Only those who lack understanding of the processes whereby myths are formed can suppose that either a tradition is true or else it was maliciously invented by cynics who knew the facts to be otherwise. In ancient times just as now, people constructed situations in their minds in accordance with their convictions about what "must" be (or have been) the case, and so had no hesitation in affirming that the relevant events had actually occurred.

In sum, the Jesus of the early epistles is not the Jesus of the gospels. The ministry of the latter may well be modeled (with considerable mythological embellishment) on the career of an itinerant Galilean preacher who lived during the early first century; whereas the Jesus of the early documents derives largely from Christian interpretation of Jewish Wisdom figures. Hence it is not unreasonable to suggest that not only the Virgin Birth in the reign of Herod the Great (documented only in two gospels, and in narratives that are mutually exclusive) and the resurrection from the dead some thirty years later (which many Christian scholars themselves now reject as unhistorical), but also the crucifixion in the time of Pilate, can be set aside as legendary.

Pagan and Jewish Comments. Christian apologists make much of the fact that, as far as we know, no one in antiquity denied that Jesus had existed. But this is readily explicable. Since Christianity long remained insignificant, its major pagan critics all wrote only after the gospels had become established, and gathered from them that Jesus was a teacher and wonder worker of a perfectly familiar kind. Hence they had no reason to doubt the main outlines of the life there ascribed to him. It is clear from what Arnobius records of pagans' criticisms of the early fourth century that, like most people today, they assessed Jesus from what is said of him in the gospels, from which they gathered that Christians were foolish enough to worship a being who was born a man, behaved as an ordinary magician, and died a death which would have shamed the lowest of humankind. Here was substance enough for their rejection of him, and it is unrealistic to expect them to have pursued their investigations into what for them was obvious rubbish to the extent of discriminating the documents and recognizing the problems which thereby emerge—something which has been only slowly and painfully achieved in modern times (see BIBLICAL CRITICISM). Indeed, it was not until the early twentieth century that some theologians both recognized a gulf between the Jesus of the gospels and the Pauline Christ, and showed some awareness of its importance for theories of Christian origins. Even today, such recognition is far from universal. The Toronto theologian S. G. Wilson admits, with characteristic frankness, that "it sometimes seems that the topic is instinctively avoided because to pursue it too far leads to profound and disturbing questions about the origin and nature of Christianity."

Appeal is still sometimes made to Tacitus as having confirmed that Jesus suffered under Pilate. But even his testimony is too late to serve as such confirmation. The Catholic scholar J. P. Meier allows that Tacitus, and Pliny too, both writing circa 112 CE, "reflect what they heard Christians of their own day say" and so are not "independent extracanonical sources." As for Jewish testimony, "no rabbinic early text . . . contains information about Jesus," and later ones "simply reflect knowledge of, and mocking midrash on, Christian texts and preaching." Meier does accept Flavius Josephus—who in one passage seems to treat Jesus's resurrection as historical fact—as an independent confirmatory source. But in fact Josephus too was writing the relevant book, *Antiquities of the Jews*, at a time (circa 94 CE) when at least some of the gospels were available, and at a place (Rome) where he could well have heard about Jesus from Christians. In any case, few allow that the obviously Christian words in that paragraph flowed from the pen of this orthodox Jewish historian. Had he believed what is here ascribed to him, he would not have confined his remarks on Jesus and Christianity to a few lines.

The theological world is now engaged in what is called "the third quest for the historical Jesus," the first (starting in the nineteenth century) and second (starting in the 1950s) having ended in failure. Meier concedes that "all too often the first two quests were theological projects masquerading as historical projects."

GEORGE A. WELLS

JOHNSON, JAMES HERVEY (1901–1988), American editor and philanthropist. James Hervey Johnson was born on August 2, 1901, in Bakersfield, California. Raised a Methodist, particularly under the influence of his minister grandfather, Johnson regularly attended Sunday school until he was fourteen. But his discovery of Thomas PAINE's *The Age of Reason* in his father's desk changed his life. He soon became a freethinker (see FREETHOUGHT) and developed a commitment to help liberate others from religion. He also became committed to lifelong bachelorhood when his freethought came into conflict with the devout Roman Catholicism of the only woman he ever loved.

At age twenty-nine, in 1930, Johnson was elected assessor for San Diego County, California. Once in office he took a get-tough policy with tax delinquents. In flamboyant raids eagerly covered by the local press, he seized and auctioned off cars, equipment, boats, and houses—reducing the average San Diegan's tax burden by about 25 percent. Moreover, in an age before the codification of exemption laws, he taxed the churches, ignoring vociferous complaints against the practice.

But his most outlandish action occurred on August 30, 1932, when he tried to auction off the San Diego Zoo for unpaid taxes. Standing at the front gate, banging his gavel before an amused crowd, he called for bids on the individual animals. The police, however, had earlier given warning that anyone who tried to remove an animal would be arrested. So no bids were made. Johnson then tried to auction the park as a whole. When that also received no bids, he rapped his gavel a final time, declaring, "Sold to the State of California for delinquent and unpaid taxes." After that, the episode was thrown into the courts, where it took weeks before a resolution was reached, one that worked out largely in the zoo's favor—though Johnson did eventually collect the tax money.

His political career ended when he received a felony conviction on an unrelated technicality. By now nicknamed "Scurvy" Johnson, he was removed from office in February 1936.

In 1942 Johnson ran for Congress, protesting, among other things, the US government's internment of Japanese Americans. Though not elected, he actively helped preserve the possessions of some of the internment victims—until he was drafted into the military at the age of forty-two.

Throughout his life, Johnson secured personal wealth through real estate and the stock market. In 1949 he self-published *Superior Men,* his freethought book, sold both through his own bookselling operation, Superior Books, and the Truth Seeker Company, publisher of *THE TRUTH SEEKER.* Johnson wrote occasionally for that publication, which was owned and edited by Charles Lee SMITH. Eventually, by 1963, Johnson had bought control of the company, merging it with his own Superior Books. Then, upon Smith's death late the next year, Johnson assumed *The Truth Seeker* editorship, promptly moving the whole operation from New York to San Diego.

Now the intellectualized racism and anti-Semitism that had become an important part of *The Truth Seeker* under Smith became more vitriolic under Johnson. Health food extremism and animal rights advocacy were given more space. Quality typography disappeared. As a result, paid subscriptions rapidly declined. When *The Truth Seeker* celebrated its hundredth anniversary in 1973, its paid circulation had fallen from the roughly two thousand Smith had bequeathed to Johnson to below eight hundred.

At the time Johnson took over the Truth Seeker Company he also secured control of Smith's AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF ATHEISM (publisher of the *Atheist*) and Smith's National Liberal League (not to be confused with the NATIONAL LIBERAL LEAGUE, a prominent nineteenth-century freethought organization of the same name, later renamed the National League for the Separation of Church and State). Johnson was already running at least three other groups, the Set You Thinking Club, the Tax Relief League, and the Freethinkers Society of San Diego. In these his racism and health advocacy were conspicuously absent. Outside the pages of *The Truth Seeker,* Johnson was conscientious about keeping his freethought separate from his other causes—so much so that many of his fellow freethinkers never knew he held these other opinions.

In his writings on religion, however, Johnson did propound a genetic theory intended to account for the observed prevalence of religious belief and the scarcity of atheism. Citing scriptural references to stonings and religious genocide, he concluded that atheists had been "systematically exterminated" by religious leaders.

Overall Johnson's views were a unique mix of the pernicious and the noble, expressed with both hostility and humanity. For example, on eugenic grounds (see EUGENICS), he favored the extermination of "all criminals." But he also expressed support for the Bill of Rights, the rights of homosexuals (albeit condescendingly), general sexual freedom, and the decriminalization of prostitution. He supported abortion rights, nursing home reform, and senior citizens' rights. A strict vegetarian, he also opposed the use of leg-hold traps on animals long before animal rights grew fashionable.

But increasingly Johnson became better known for his

bigotries, which most likely led to the apparent arson of the Truth Seeker Company on October 3, 1981. All of Johnson's stock, records, and archives were completely destroyed in the blaze. Because he lived in the top floor of the building, he barely escaped with his life, suffering minor burns. And eleven days later, while crossing the street in front of the building's remains, he was struck by a car in an accident. Johnson was hospitalized for weeks afterward in a Roman Catholic hospital, during which time several of his properties were looted. The driver's insurance company eventually paid Johnson $50,000.

After that, when Johnson resumed his publishing of *The Truth Seeker*, a change in content began to emerge. Most of the material on race and health disappeared. The tone softened. Freethought concerns dominated. Added were a number of detailed and illustrated articles critical of routine infant male circumcision. Also added were positive articles suggesting solutions (albeit naive and simplistic) to domestic and world problems and pointing out select positive aspects of some religions. Nonetheless, the publication's decline continued unabated, dropping to around three hundred subscribers by the end of 1984.

In his personal life, because Johnson distrusted doctors and rejected the germ theory in favor of the "toxemia theory" of disease, he self-treated various ailments that were probably symptomatic of cancer and diabetes. So it was that on August 6, 1988, while in his bath trying to soak away pain, Johnson died of a heart attack. He was eighty-seven. At his request, no memorial service was held. And in his will he bequeathed his entire estate of roughly $17 million toward the continuance of *The Truth Seeker* and the establishment of a trust to "expose religion as against reason and to publicize my views on religion and health."

That trust was subsequently established: the James Hervey Johnson Charitable Educational Trust. But the story didn't end there. Over a decade of litigation and controversy followed. Madalyn Murray O'HAIR, president of American Atheists, sued unsuccessfully to secure the estate. After *The Truth Seeker* was relaunched as a glossy magazine partially devoted to eccentric reform topics, James W. Prescott—for a time its editor—sued unsuccessfully to secure alleged unpaid compensation. He also reported to California authorities alleged breaches of the trust; during the early 1990s grants were often made to San Diego community groups such as the local Boy Scouts organization instead of deserving freethought organizations. After a state investigation, grants to freethought organizations increased. Then, by a stratagem where all grants were made to a single organization set up for the purpose of receiving them, which then distributed the monies in various ways, freethought organizations ceased to benefit. But in 2005, apparently due to pressure from the state of California, significant grants to freethought organizations resumed. The *Truth Seeker* ended publication in 1997, though the company itself still exists.

JUDAISM, UNBELIEF WITHIN. There are two kinds of secular Jews. The first group includes Jews who value their Jewish identity and seek to preserve it in a nonreligious way. The second group includes Jews who are freethinkers and who find no value in their Jewish connection. Only the first group is of interest to this study. The second group belongs to the general history of SECULARISM.

Discovering the Jewish secular tradition is sometimes difficult. Outside of Israel, Jews have given up the unique languages—like Hebrew, Yiddish, and Ladino—that defined their ethnic separation. Diaspora communities generally present themselves to the Gentile world as religious fraternities. Except in Israel, secular Jews remain isolated from the Jewish establishment. When they have chosen to organize, they have combined their secular agenda with a socialist (see SOCIALISM AND UNBELIEF) or Zionist one. Frequently the socialist or Zionist commitment pushes the secular strategy into the background. Further, the absence of a professional class of secular Jewish leaders—a counterpart of the rabbis—has deprived the secular community of visibility and power.

The secular tradition, as a literature, is comparatively new. But the secular tradition as an experience has deep roots in Jewish history. No written anticlerical traditions survive from the ancient past. We know about them only through denunciation.

Arguments with God about morality of his behavior are also part of the secular roots. When Yahweh became an all-powerful and all-good God, the problem of theodicy emerged. If God has the power to prevent evil, why does he not choose to do so? The outcry of the pious Berdichever Rebbe, who put God on trial, is a discreet manifestation of the challenge. Given the suffering of the Jewish people, SKEPTICISM was inevitable, even though it was not safe to articulate it publicly (see EVIL, PROBLEM OF).

The economic experience of the Jews laid the foundation of secularism. As the Jews turned from farming to commerce, peasant piety was replaced by the entrepreneurial skills of merchants and bankers. Literacy came with urbanization and trade, and affluence produced the leisure for secular studies. In Arab Spain, Jewish poetry often abandoned the subject of God for reflections on love and nature.

In modern times the admission of Jews to secular professions such as medicine and law produced secular

intellectual rivals to the rabbis. Secular universities replaced yeshivas as the vehicles of social advancement. Secular education was the quickest way for Jews to climb the ladder of success.

Philosophically, part of the rabbinic establishment was also "corrupted" by exposure to Greek philosophy. Under the influence of the ideas of PLATO and ARISTOTLE, medieval Jewish philosophers turned Yahweh into a God atheists would be comfortable with. Saadia's God was a Platonic abstraction. And the God of Maimonides, who could be described only in terms of what he was not about, was as interesting as Aristotle's first mover. Both prayer to and passion for such a deity were moving apart. RATIONALISM became one of the rabbinic modes and threatened to undermine religious fervor.

DEVELOPMENT

Jewish secularism became an open and clear option with the emergence of the ENLIGHTENMENT in western Europe. The Age of Reason undermined Jewish segregation and the authority of the rabbinic establishment. From the middle of the eighteenth century, Jewish HUMANISM was no longer an underground movement. It produced leaders and literature.

The *Haskalah*, the Jewish Enlightenment. The *Haskalah* found its first center in Berlin. It was there that Moses Mendelssohn denied that Judaism compelled theological belief. It was there that Naphtali Herz Wessely opened the Jewish Free School in 1788. The Free School was the first Jewish school in which secular studies were the primary focus of Jewish education. It produced a secular Jewish elite who were to transform German Jewish life. Both Reform Judaism and humanism were creations of this conversion to reason.

The use of Hebrew as a secular language became the vehicle of the *Haskalah*. Pious Jews regarded Hebrew as a sacred language, appropriate only to religious devotion and study. Yiddish was the popular tongue, available for profane use. The use of Hebrew by the *Maskilim* (the devotees of the *Haskalah*) for secular purposes demonstrated the elitist and snobbish side of the rationalist pioneer, and it segregated them from the Jewish masses. But it gave them a unique and prestigious symbol with which to assault the religious establishment. The Hebrew periodical *Ha-Messef* became the voice of the new Jewish Enlightenment.

The exaltation of reason over traditional faith led to public declarations of radical belief. While ATHEISM was still too dangerous to embrace, the God of DEISM became fashionable. Imprisoned by his own irreversible decrees, God could do nothing to change the laws of nature. The universe was guided by inexorable laws that were indifferent to prayer. The God of Mendelssohn and his Enlightenment cohorts logically required neither praise nor ritual. It was only a hop, skip, and jump to SECULAR HUMANISM.

The Enlightenment ultimately led to the secular fervor of the French Revolution. The consequence of this upheaval was the emergence of the secular state and the political emancipation of the Jews. The new National Assembly created in 1789 separated religion and ethnic origin from the new concept of French citizenship. All native-born residents of territorial France were eligible to be Frenchmen. Jews were granted the status of French citizens. They were no longer to function as a distinct nationality.

The emancipation produced a major crisis in Jewish life. Until modern times the Jews had viewed themselves and were viewed by others as an ethnic group, a "nation" without a country. This awareness was reinforced by a unique language, by a unique national religion, and by the alien status of the ghettoized community. But liberation brought with it the tyranny of the centralized secular state. No dual political loyalty was allowed, and cultural conformity was the order of the day.

Political safety demanded that the Jews redefine themselves as a religious denomination. With the disappearance of Yiddish among the Ashkenazic Jews of western Europe, such a deception could be maintained. Jewish leaders confessed to Napoleon that they were only Frenchmen of the Mosaic faith. The Age of Reason had become unreasonable.

The reform movement assumed the burden of this political strategy. Secularized Jews who valued their Jewish identity or who were prevented from assimilation by anti-Semitism now found themselves with the need to be religious. But the ideology they embraced was not always friendly to genuine religious commitment. The result was a religious movement with a secular heart and a religious body. Jews who were openly nonreligious were denied "Jewish" status by this odd turn of events.

Political emancipation retarded the development of Jewish secularism in western Europe. Ethnic Jewishness could not fit into the available social categories respectably open to Jews. The thrust of religious reform drove honest secular Jews out of the Jewish community.

Two developments ultimately rescued Jewish secularism. The rise of racial anti-Semitism in France, Germany, and Austria arround 1880 forced assimilated Jewish freethinkers to confront their Jewish identity. Moses Hess, Theodore Herzl, and Max Nordau are leading examples of prominent intellectuals who decided to rescue Jews. For Edouard Drumont and William Stewart Chamberlain, the most prominent propagandists of the new anti-Semitism, religious belief was irrelevant to Jewish identity; birth and racial connection were primary. With such adversaries, pleading atheism was useless.

The *Haskalah* in Eastern Europe. The arrival of the *Haskalah* in eastern Europe transformed the Jewish communities of Poland and Russia. In a world of millions of Yiddish-speaking Jews who enjoyed no political emancipation and who suffered government persecution, a secular Jewish nationalism was bound to be successful.

As the assault of secular education dissolved old religious beliefs, many Jews refined their Jewish identity without any reference to theology. Yiddish culture became the secular criterion for Jewishness.

Despite its revival of secular Hebrew, the *Haskalah* in western Europe ultimately yielded cultural assimilation. Cultural pluralism was not a viable option in the urban centers of France, Germany, and England. But the *Haskalah* in eastern Europe stimulated an intense secular nationalism, which thrived on political persecution and ethnic segregation.

In Poland and Russia the economic and political hardships of Jews were so enormous that no successful secular movement could focus on secularism alone. Two proposed solutions to the Jewish problem emerged. The first was socialism; the second was Zionism. All socialists were secularists, whether they were of the populist or Marxist variety. But not all Zionists were, even though the leadership of the movement was in secular hands.

Adolf Hitler and the Holocaust ultimately destroyed the home bases of *Haskalah* assimilation and *Haskalah* nationalism. They were also assisted, in eastern Europe, by the hostility of the new Communist authorities to Zionism and Jewish socialism. The drama of Jewish history moved elsewhere. The western European setting of cultural assimilation moved to America. The eastern European setting of secular nationalism moved to Israel.

Varieties

It is possible to distinguish five varieties of Jewish secular humanism, each producing its own style and literature. Some are assimilationist, some are intensely nationalistic, while still others are a combination of both.

Ethical Culture. The Ethical Culture movement does not identify itself as a Jewish movement, but many outsiders have. For many years the overwhelming majority of its members were Jews. Bourgeois Jewish secularists who were neither nationalistic nor Zionist found a home there. While the movement did nothing positive to develop Jewish self-awareness, the organization enabled Jews, especially intellectual and social-activist Jews, to spend time with like-minded Jews. It was a haven for many Jews who could find no comfortable place in establishment institutions.

Founded in 1876 in New York City by Felix Adler, the son of a radical Reform rabbi, Ethical Culture was dominated for many years by the culture and the style of the German Jewish elite. Although Adler denied that Judaism was anything more than a religion and maintained that Jewish identity was a religious identity distinct from Ethical Culture, some felt that he functioned as an agnostic rabbi who served the cultural community with which he was familiar. Although Adler insisted that this ethical philosophy was a religion, God and prayer were omitted from the Sunday meetings. It was the kind of setting that a secularist, agnostic, or atheist would feel comfortable in.

The Ethical Culture movement was partly the result of the need of assimilated Western Jews to define themselves religiously for reasons of political safety. Cultural pluralism was anathema to the German Jewish bourgeoisie. Conversion to Christianity was intellectually unacceptable and emotionally guilt producing. Ethical Culture was a suitable compromise granting philosophic integrity and Jewish association. In New York it became an important presence in Jewish life. In recent years the Jewish membership has declined, and in certain communities, such as the St. Louis Ethical Culture Society, there has never been a large number of Jewish members.

Jewish Socialism. For many Jews secularism was an aspect of their socialist commitment. While some romantic socialists, such as A. D. Gordon, were mystical and religious—hoping to turn the Jews into a nature-loving peasantry—the so-called scientific socialists followed Karl Marx and found in atheism a personal liberation.

Jewish socialists could not separate secularism from egalitarian politics. Dismissing God went hand in hand with elevating the proletariat. Atheistic fervor was tied to revolutionary passion. Since Yiddish was the language of the Jewish masses, it too could not be separated from the atheist enterprise. The negative attitudes of the social-climbing Jewish bourgeoisie to the use of Yiddish made this commitment especially important to Jewish socialists. Promoting a secular Yiddish literature was added to Marxism and humanism.

Jewish socialists were never united. They were divided by controversies over many issues. The Russian Revolution and the policies of the Soviet government sparked endless debate. The rise of Zionism posed the question of where the socialist paradise should be created. And chronic anti-Semitism undermined the radical hope that proletarian self-awareness would replace Jewish identity. Jewish socialist atheism became a carnival of internal arguments.

The strongest socialist group was the Bund. Founded in 1897 in the Russian Empire (one year before the establishment of the Russian Social Democratic Party), it was committed to Marxism and Yiddish nationalism. Standing in opposition to the Zionists and the Communists, the Bund mobilized thousands of Jewish radicals. After the Bolshevik Revolution made Russia hostile territory, it flourished in Poland. As a political and cultural force between the wars, it spoke for a large part of the Jewish community.

Immigrants brought the Bund to North America. Named the Arbeiter Ring (Workman's Circle), it created its own system of schools and cultural institutions. But America was not an environment conducive to the survival of either Yiddish or socialism. While the Holocaust destroyed the Bund in Poland, the power of Anglo-Saxon capitalism undermined it in the New World.

Today Jewish socialism encompasses only a diminishing group of aged radicals who have only enough energy for nostalgia. The formerly powerful Yiddish socialist newspapers like the *Vorwaerts* and the *Morgan Fruheit* have lost their readers.

Secular Zionism. The modern movement to establish an independent Jewish homeland has been the most large-scale Jewish enterprise in the twentieth century. No other Jewish project has claimed the support of so many people, Jews and non-Jews alike. The state of Israel has become the single most important institution in Jewish life, uniting divided communities and giving reality to Jewish identity.

The founders of modern Zionism were secular Jews who believed that the homeless condition of the Jewish masses could only be alleviated with the establishment of a Jewish culture in a Jewish state. Pinsker, Herzl, and Nordau—and the Jews who followed them—found in Zionism an alternative to religion. Some of the early Zionists were religious, but the overwhelming majority was searching for a secular way to save Jews and Jewish identity.

Secular Zionists came in three varieties. Bourgeois Zionists like Herzl and Brandeis wanted a Jewish state that resembled a European capitalist democracy. Nationalist Zionists like Jabotinsky preferred a militant state that was defended by proud and fearless warriors. Socialist Zionists dreamed of a model egalitarian state where clerical, bourgeois, and military domination would cease to exist. As time went on, the bourgeois and nationalist Zionists discovered that opposition to religion subverted their political ambitions. Only the socialist Zionists remained fiercely secular.

The kibbutz commune became a dramatic example of secular socialism. Most kibbutzim rejected religious behavior and religious authority. They sought to secularize Jewish holidays and life-cycle ceremonies. Because they were self-contained communities united by a strong ideology, they succeeded in fashioning a secular ceremonial alternative to traditional ritual. They stood in sharp contrast to urban humanists, who were never able to establish a support system that would enable them to go beyond the negative rejection of religion to a positive secular identity.

Today in Israel the secular position is weaker than it was at the inception of the Jewish state. Oriental Jewish immigration, the disillusionment with the Left, and the obvious political advantages of religious nationalism have undetermined the secular majority. The collapse of the kibbutz movement has removed the strongest source of secular idealism and energy from the political scene. The old secular political party Yahad, begun by Shulamit Aloni, still lingers on the periphery of power. A new secular political party, SHINUI, founded by television star Tommy Lapid, has a problematic future. The Orthodox religious parties offer a large, volatile constituency that both liberals and conservatives cannot ignore when they form coalitions. Outside the political framework, urban secularists are striving to serve the domestic needs of secular Jews. Secular ceremonialists are offering alternative ceremonies to those of the Orthodox rabbis who hold a state monopoly on marriage and divorce rites. Secular rabbis, who have been trained at the Jerusalem campus of the International Institute for Secular Humanistic Judaism, the educational arm of the growing humanistic Jewish movement, are now available as teachers, counselors, and ceremonialists. Strong attempts are being made to supplement hostility to Orthodox power with a deeper awareness of a more positive humanism.

Jewish Secularism. In North America many secular Jews who were wary of socialist and Zionist controversies established schools for Jewish children that had no political agenda. They took names like the Sholem Aleichem Institute, Jewish Peoples Institute, Jewish Parents Institute, the Secular Jewish Association, and many others. However, their failure to create viable adult communities and to train professional leaders limited their growth. Today, the Congress of Secular Jewish Organizations has become their federation.

The ideas of philosopher Horace Kallen have been used to define the program of this nonpolitical secularism. In the North American setting where ethnic groups retain self-awareness within a context of dispersion and linguistic assimilation, Kallen recommended the value of democratic, cultural pluralism. He rejected the goal of turning America into a "melting pot" and upheld dual cultural loyalties. A good citizen could participate in both American and Jewish cultures.

The periodical *Jewish Currents*, originally established as a public voice for anti-Bundist and anti-Zionist Jewish Communists, has now abandoned its old format and become a useful periodical for more moderate secularists.

Humanistic Judaism. In 1963 the Birmingham Temple was established in the Detroit area. Led by Sherwin T. Wine, who was trained as a Reform rabbi, it embraced a Jewish secularism it labeled "humanistic Judaism." The uniqueness of this new institution lay in its willingness to borrow from the religious sector the idea of organized, nonpolitical adult communities and the idea of trained professional leaders. Wine maintained that without these structures a secular Jewish identity could not be successfully maintained in a Western urban setting.

In 1969 the Society for Humanistic Judaism was established to organize new secular Jewish congregations and communities. At present forty Humanist Jewish communities exist in North America. The journal of the Society, *Humanistic Judaism*, has become an important secular Jewish voice for English-speaking Jews. In 1986, at the initiative of the Society for Humanistic Judaism, an International Federation of Secular Humanistic Jews was created in Detroit. Fifteen national federations and schools from seventy-two countries are presently members, with an estimated population of fifty thousand. Given the fact that close to 50 percent of the world's Jewish people

(some six million) identify themselves as secular or cultural Jews, the task of organization has just begun.

The future of Jewish secular humanism will be determined by the following realities: (1) Jewish professional education will continue to undermine traditional religious beliefs. (2) Increasing intermarriage between Jews and non-Jews will enable many Jews who have intermarried to deal with their Jewishness as a cultural rather than a religious identity. (3) The affirmation of ethnic roots will enable many alienated Jews to cope more effectively with the experience of urban rootlessness. (4) The national culture of the state of Israel, its literature, arts, and celebrations, will provide a modern secular alternative to the religious culture of the past.

SHERWIN T. WINE

KANT, IMMANUEL (1724–1804), German philosopher. Immanuel Kant is generally recognized as one of the greatest philosophers of the Western world. His reputation is based mainly on his contributions to the theory of knowledge and to moral philosophy, although he also has contributed to other parts of philosophy, including the philosophy of religion. The general admiration for Kant is perhaps somewhat exaggerated. Much of what he had to say was wrong or badly founded, and stylistically, Kant is a catastrophe. Though there are German philosophers who have an even more opaque style, Kant's style is obscure enough to have produced numerous academic headaches and an extensive "Kant industry."

Still, Kant is an original philosopher and his historical importance is beyond any reasonable doubt. Many professional philosophers view Kant's impact on subsequent philosophy as rivaled by few other thinkers. And although few contemporary humanists agree with the whole of Kant's philosophy, to some extent he remains important for modern HUMANISM.

Philosopher of the Protestants? Kant is sometimes regarded as a philosopher of the Protestants in the same way that Thomas Aquinas is considered *the* philosopher of the Catholics. One might think a philosopher so important for Protestantism an unlikely candidate for a similar position among secular humanists (see SECULAR HUMANISM). But this is not so, for various reasons.

First, secular humanists (unbelievers concerned with humane living and values) share some ideals with the best of Christianity. It is mainly in the *justification* of these ideals that secular humanists part company with Christians.

Second, and more important, Kant is in no way an official philosopher of the Protestants. Many Protestants ignore philosophy of any kind, or hold fragmented philosophical beliefs drawn from various sources and seldom integrated into a unified system. (A similar situation prevails among some secular humanists, some of whom do not even know that they are humanists.) Even Protestants with a philosophical education do not always look to Kant to justify their faith. Some look to the religious existentialists for support, whereas others look to one or more medieval philosophers, including a major source of them all: Augustine. But it is characteristic of many thinking Christians that they look to philosophers for support of their faith: the Bible simply is not enough.

Proofs of the Existence of God. Kant, like secular humanists, rejected the Bible as a reliable source of truth. He did not do this in any straightforward way, but this conclusion is implied throughout his writings. So in his celebrated *Critique of Pure Reason* (1781) he rejected traditional "proofs" of the existence of God. Although elements of these proofs can be found in antiquity, the proofs were developed in their classical form during the Middle Ages, not the least by Thomas Aquinas.

Kant undertook a new classification of the proofs or arguments. He distinguished between the ontological, the cosmological, and the physico-theological arguments (see EXISTENCE OF GOD, ARGUMENTS FOR AND AGAINST). We do not need to go into the details of these arguments. What is important here is that Kant rejected them all. Although he does not say it in so many words, Kant further believed that there were no other arguments of importance, and that the arguments he had considered and rejected were singly and jointly without force for any belief in God. Thus, for the Kant of the *Critique of Pure Reason*, it was impossible to prove the existence of God.

God's position in Kant's philosophy was not improved in Kant's next important publication, *Foundation of the Metaphysics of Morals* (1785). In this slim book (about seventy pages), Kant gives an analysis of the foundation of ethics. What is remarkable from a sec-

ular point of view is that God is ignored in the *Metaphysics of Morals*. The word "God" occurs only in unimportant passages, and it is abundantly clear that for the Kant of 1785, ethics finds its basis in man, not God. Thus, here we find another feature common to Kant and secular humanism: ethics has its foundation in the human world. True, in his attempts to find a basis for ethics Kant presents a curious and unconvincing view of humanity. But at least God is considered irrelevant to this process.

God: The Moral Argument. On the whole, Kant's view remains the same in his next publication, the *Critique of Practical Reason* (1788). This book follows the same main lines of the *Metaphysics of Morals*, but it is less concise. God makes an unexpected appearance in book 2, chapter 2 of the *Critique of Practical Reason*, and this passage has had the effect of endearing Kant to many religious believers. Having rejected that the existence of God can be established within the framework of theoretical reason, Kant here argued that the reality of God was a postulate of practical or moral reason.

The background of this new way of thinking was the following. According to the Kant of 1788, the highest good, which is the aim of the moral will, often cannot be reached on this earth. The highest good includes both virtue and happiness. And this cannot always be reached in this life. If this life were all there is, then moral behavior would become meaningless. As moral behavior is not meaningless, we are forced to postulate a life after this one. In this way Kant postulates both immortality and God. Having thrown God out through the front door in the *Critique of Pure Reason*, the Kant of the *Critique of Practical Reason* readmits God through the back door.

Still, it remains unclear what Kant means when he defines God as a postulate of practical reason. He continues to maintain that the existence of God cannot be proven. But he clearly states that it is "morally necessary to assume the existence of God." Kant has been widely interpreted as introducing a new argument for the existence of God, the so-called moral argument. But at the same time Kant writes as if he has no new argument to offer after having demolished the former arguments for the existence of God. In any case it is important to notice that Kant's new contention in no way makes God the basis of ethics. It is rather that ethics is made the basis of God.

Thus, Kant continues to agree with secular humanism. God is not the basis of ethics; ethics still finds its foundation in humanity. But the secular humanist cannot agree that ethical behavior can provide any basis for postulating the existence of God. Ethical behavior is largely identical with customs and habits, inculcated in children from a very tender age, and which adults either accept without reflection or may justify by referring to the importance of ethical behavior if families and societies are to function successfully. In this way ethical behavior is justified by referring to something greater than the individual—but the object held greater than the individual is the family or society. Neither ethical behavior nor anything else provides any convincing evidence for the existence of God or the existence of an afterlife.

In his ethical theory Kant emphasized the good will, the only good that is good without qualification, and which is manifested in acting for the sake of duty. Duty means acting out of reverence for the moral law that is prescribed by reason. Kant's emphasis on reason makes him a child of the Age of Enlightenment to which many humanists hearken (see ENLIGHTENMENT, UNBELIEF DURING THE).

Secular humanists do not commonly stress duty to the same extent as Kant. In fact, secular humanists often tend to downplay duty in their ethical accounts. But it is fully possible to be a secular humanist and emphasize duty to almost the same extent as Kant. But it is not convincing to base duty on pure reason. It is doubtful whether anything like "pure reason" exists, and we cannot base our duties on something of doubtful existence. Our duties must be based on our relations to other human beings.

Human Beings as Ends in Themselves. One of the two or three main versions of Kant's celebrated categorical imperative makes a reference to human beings. Kant postulates that the human, and in fact any rational being, is an end in itself. We should always treat any other person as an end, and never merely as a means. Even though this version of the categorical imperative refers to rational beings only and contains no element of compassion, it is of great ethical significance.

This is not the first time in the history of Western ethical philosophy that our relation to fellow beings is stressed. The Golden Rule, which states that we should treat other persons as we would be liked to be treated ourselves, makes its appearance already in PLATO, and for ARISTOTLE friendship was an important value. But as a whole, historically important ethical philosophers did not stress relations to other persons. It is only with Kant and the utilitarians that such relations become a major theme in ethical philosophy. Here the secular humanist can again find common ground with Kant.

Conclusion. There are some similarities but also many differences between Kant's philosophy and secular humanism. For secular humanism, Kant's criticism of the arguments for the existence of God, and his effort to base ethics upon human beings rather than God, remain viable elements of his philosophy. Secular humanists will, of course, dissociate themselves from Kant's attempts to reintroduce God and immortality in his later philosophy. Secular humanists might also learn from Kant by emphasizing duty more than is commonly done, if not to precisely the same extent.

Secular humanists may also agree with Kant when he states that we should treat our fellow beings as ends and not only as means. Kant's attitude toward metaphysics is also of interest to secular humanists, who might benefit from abandoning a one-sidedly negative view of meta-

physics in favor of developing and defending some kind of explicitly materialistic metaphysical position.

Kant, in spite of many doubtful features in his philosophy, remains a predecessor of secular humanism. Kant's philosophy as a whole is rather remote from contemporary secular humanism; surely he was no secular humanist, and it may be misleading to call him a humanist at all. Still, Kant's thought constitutes one of the many intellectual roots of secular humanism.

FINNGEIR HIORTH

KAUFMANN, WALTER (1918–1980), American philosopher and translator. Although raised in his native Germany as a Lutheran, Walter Kaufmann converted to Judaism, the faith of his ancestors, at the age of twelve, since he could not believe in the reality of Jesus. Before his formal conversion to Judaism, Adolf Hitler came to power and Kaufmann was warned that it would be best to remain nominally a Christian. Demonstrating his lifelong commitment to intellectual honesty, he refused to change his mind. While he initially planned on becoming a rabbi, Kaufmann came to doubt the existence of a supreme being (in part due to the absence of divine intervention to prevent the Holocaust, in which several of his relatives were killed). He came to refer to himself as a "heretic" (see HERESY). In 1939 he left Nazi Germany for America, graduating from Williams College with honors in 1941. Kaufmann served in the US military during World War II. Afterward, he completed a PhD from Harvard University in the philosophy of religion and became a professor of philosophy at Princeton University, where he would remain until his death.

Kaufmann is best known for his translations and introductions to the works of Friedrich NIETZSCHE. During Hitler's regime Nietzsche became known as the "Nazi Philosopher," and after the war no one did more to clear his name than Kaufmann. In 1950 he wrote the popular book *Nietzsche: Philosopher, Psychologist, Antichrist*, which took pains to separate Nietzsche's advocacy of individualism and FREETHOUGHT from the heinous usage made of his teachings by the Nazis. Kaufmann would later edit for Penguin Books the best-selling volume *The Portable Nietzsche*.

His collections *Existentialism from Dostoevsky to Sartre* (1956) and *From Shakespeare to Existentialism* (1959) did much to popularize the philosophy of existentialism in the English-speaking world (see SARTRE, JEAN-PAUL; EXISTENTIALISM; SHAKESPEARE, RELIGIOUS SKEPTICISM IN). In addition, Kaufmann wrote two major works discussing his own views on religion and belief: *Critique of Religion and Philosophy* (1958) and *The Faith of a Heretic* (1961). In these books, he extols the virtue of living a freethinking existence, and castigates theology in all its flavors. "Theology" means literally the study of God, and yet no one knows for sure if such a being exists. How, then, can there be a science based upon a being who remains at best a hypothesis? Kaufmann had a passion for truth and for courage, and shared with the existentialists (most of whom he strongly criticized for not living up to their own ideals) an advocacy for authenticity. His chief complaint against theology was that it is neither a science nor a philosophy, but rather a type of doublespeak, wherein texts are made to communicate contradictory views to different readers.

In *The Portable Nietzsche*, Kaufmann states that the history of modern philosophy, from René DESCARTES to the present, is the story of emancipation from religion. He was especially caustic in his critique of the view that morality cannot exist without religion. In *Faith of a Heretic*, he writes that "this odd retort is in a way irrelevant, but often gives expression to a heartfelt worry. Why irrelevant? The same retort might well be made when Santa Claus is questioned. In that case, one answers: You have to grow up and face the facts; honesty is important, too; and parents can still reward the well-behaved child while withholding presents from the naughty one, without invoking Santa Claus. In the case of God and organized religion, the same answer will do: secular authorities remain to discourage evil."

Kaufmann was also a noted translator of the works of GOETHE, and a poet in his own right. He was a strong advocate of clarity in writing, and argued that the obscure writing style of Immanuel KANT, G. W. F. Hegel, and Martin Heidegger, among others, was perhaps due to their own fear of discovering truths they were not prepared to deal with. He felt it a scandal that so many philosophers hid behind abstruse and confusing language, and took it as a mark of pride to be as precise and clear as possible in his meanings.

Kaufmann signed *A Secular Humanist Declaration* shortly before his untimely death in 1980.

TIMOTHY J. MADIGAN

KELLGREN, JOHAN HENRIC. See **SWEDEN, UNBELIEF IN.**

KHAYYÁM, OMAR (c. 1048–1123 CE), Persian poet and mathematician. The name of Omar Khayyám was mentioned in Basel in 1583, but the first that the West

encountered his poetry was probably in 1700, when Thomas Hyde in his *Veterum Persarum . . . religionis historia* gave a Latin translation of one of Khayyám's quatrains. In 1771 Sir William Jones in his *A Grammar of the Persian Language* quoted without attribution a complete quatrain and part of another, generally ascribed to Khayyám. Several Persian quatrains were published in a Persian grammar compiled by F. Dombay in Vienna in 1804. In 1816 H. G. Keene produced further translations into English. Edward Fitzgerald's inspired translation/paraphrase relied largely on a manuscript discovered in the Bodleian Library at Oxford in 1856 by the man who had taught Fitzgerald Persian, E. B. Cowell.

Khayyám's quatrains, or *rubai*, are independent epigrammatic stanzas—in other words, short, spontaneous, self-contained poems. Each *rubai* stands on its own. Fitzgerald, however, makes them a continuous sequence, saying that the stanzas "here selected are strung into something of an Eclogue." In addition, he sometimes combined fragments of once-distinct quatrains into new ones. Thus, far from being a close translation, in the words of scholar V. Minorsky, Fitzgerald's version is a paraphrase of "exceptional poetical merits."

But who was Omar Khayyám? Very little is known for certain of his life and writings, particularly his poetry. He was probably born in 1048 in Nishapur, Persia, and died there in 1123. Khayyám was, according to George Sarton, "one of the greatest mathematicians of mediaeval times." He also wrote on physics (the specific weight of gold and silver), astronomy, geography, music, metaphysics, and history. While in Samarkand (now Uzbekistan) Khayyám worked at the newly built astronomical observatory, and helped draw up a new calendar that was in many ways far superior to the Julian calendar—certainly comparable in accuracy with the Gregorian one.

Khayyam also wrote five philosophical treatises, much influenced by the renowed Ibn Sina (Avicenna). They stand in direct contrast to the SKEPTICISM and AGNOSTICISM of his verse, arguing, for example, for the necessity of God as the final cause of all causes. In another treatise, Khayyám explained the stability and permanence of phenomena by the will of God. In his last philosophical work, Khayyám defended Ibn Sina's theory of a "chain of order," and in a classification of "men who strive to know truth" he accorded Sufis the highest place.

In one of our early sources of his life and poetry, *Mirsad al-'Ibad* (The Watchtower of the Faithful), Khayyám is described as an atheist (see ATHEISM), philosopher, and naturalist: "Observation (of the world) leads to faith, the quest (for the Eternal) to gnosis. The philosopher, atheist, and naturalist are denied this spiritual level; they have been led astray and are lost." Omar Khayyám is considered by the blind as a sage, an intelligent man. However he is so lost in doubt and shadows that he says in quatrains:

This circle within which we come and go
Has neither origin nor final end.
Will no one ever tell us truthfully
Whence we have come, and whither do we go?

*

Our elements were merged at His command
Why then did He disperse them once again?
For if the blend was good, why break it up?
If it was bad, whose was the fault but His?

There is no consensus as to what constitutes Khayyám's poetic corpus, each generation casting doubt on the authenticity of this or that quatrain. But from an early period, various writers ascribed to him the melancholic philosophy that we have come to associate with him. For instance, Farid al-Din Attar summed up Khayyám's thinking thus: "Since neither the beginning nor the end of life is clear, no one will find in this inferior world either head or tail. The sky is a ball without beginning or end, the earth is a foul valley where all men lose their way, the world is misery, the Wheel [of fate] plays with us." Writing in the late twelfth century CE, Zahiri-i Samarkandi described Khayyám's poems as adding to the "theme of the precariousness of a world devoid of reason, that of the consequences of withdrawing from it; since no one will return to the world below to reveal the secrets of other places, it is imperative that all enjoy their share of good living, in particular the pleasures of wine and romance. Not to do so would be a mistake. [Khayyám's] poems also evoke the theme of the earth as dust; the cup and the pitcher are made from remains of humans who were proud."

The constant themes of Khayyám's poetry are the certainty of death, the denial of an afterlife, the pointlessness of asking unanswerable questions, the mysteriousness of the universe, and the necessity of living for and enjoying the present:

*

No one has ever pierced this veil of secrets;
No one will ever understand the world.
Deep in the earth's our only resting place;
Cry out, 'This is a story without end!'

*

The heavenly bodies that circle round the skies
Are full of mystery even to learned men;
Hold firm the thread of wisdom in your hand,
For those who plan their lives will be confused.

*

A drop of water fell into the sea,
A speck of dust came floating down to earth.

What signifies your passage through this world?
A tiny gnat appears—and disappears.

*

Long will the world last after we are gone,
When every sign and trace of us are lost.
We were not here before, and no one knew;
Though we are gone, the world will be the same.

*

Of all the travellers on this endless road
Not one returns to tell us where it leads.
There's little in this world but greed and need;
Leave nothing here, for you will not return.

*

I am not here for ever in this world;
How sinful then to forfeit wine and love!
The world may be eternal or created;
Once I am gone, it matters not a scrap.

*

When once you hear the roses are in bloom,
Then is the time, my love, to pour the wine;
Houris and palaces and Heaven and Hell—
These are but fairy-tales. Forget them all.

The above quatrains are not from Fitzgerald's translation, but from translations compiled by Ali Dashti in his *In Search of Omar Khayyam* and translated into English by Elwell Sutton.

Fitzgerald himself, in his prefaces to his many editions, would have no truck with squeamish or puritanical scholars who pretended to see something spiritual in Khayyám's verses, and who interpreted every appearance of the word "wine" mystically. For Fitzgerald the burden of Khayyám's song, if not "let us eat," is assuredly "[l]et us drink, for tomorrow we die!" Some may see Khayyám as a Sufi, but "on the other hand, as there is far more historical certainty of his being a philosopher, of scientific insight and ability far beyond that of the age and country he lived in, of such moderate worldly ambition as becomes a philosopher, and such moderate wants as rarely satisfy a debauchee; other readers may be content to believe with me that while the wine Omar celebrates is simply the juice of the grape, he bragg'd more than he drank of it, in very defiance perhaps of that spiritual wine which left its votaries sunk in hypocrisy or disgust."

Here are some examples of Fitzgerald's paraphrase of Khayyám, from his first edition:

*

Dreaming when Dawn's Left Hand was in the Sky
I heard a Voice within the Tavern cry:
"Awake, my Little ones, and fill the Cup
Before Life's Liquor in its Cup be dry."

*

And, as the Cock crew, those who stood before
The Tavern shouted: "Open then the Door!
You know how little we have to stay,
And, once departed, may return no more."

The Worldly Hope men set their Hearts upon
Turns Ashes—or it prospers; and anon,
Like Snow upon the Desert's dusty Face
Lighting a little hour or two is gone.

IBN WARRAQ

KIRKENDALL, LESTER A. (1903–1991), American sex educator and humanist. A professor at Oregon State University, Lester A. Kirkendall laid claim to having taught the first course on human sexuality on a university campus in the United States, and he is best known as a sex educator. With Mary CALDERONE, he founded the Sex Information and Education Council of the United States (SIECUS) in 1964, and traveled across the country speaking about sex education. He wrote extensively on sexual matters, writing or editing some of the foundational books of the sexual revolution of the 1960s.

Kirkendall signed *Humanist Manifesto II* (1976) and was recognized as Humanist of the Year by the AMERICAN HUMANIST ASSOCIATION in 1983.

VERN L. BULLOUGH

KNEELAND, ABNER (1774–1844), American freethinker. Born in Gardner, Massachusetts, on April 6, 1774, Abner Kneeland was one of ten children of Timothy and Moriah Stone Kneeland. With little formal education, Abner was expected to enter the carpentry trade like his father. He also worked as a teacher and an author of spelling books, but he found his first calling in the Baptist Church.

After serving briefly as a Baptist preacher in Vermont, Kneeland met Hosea BALLOU, the prominent Universalist minister (see UNIVERSALISM TO 1961), and was influenced by Ballou's theology. Kneeland's conversion to Universalism led to his becoming ordained in 1804. He served for seven years as minister at a church in Langdon, New Hampshire. During this time, he and Ballou compiled a new Universalist hymnal, and several of the provocative hymns contributed by Kneeland were rejected by the New England Universalist General Convention.

In 1811 Kneeland transferred to a new church in Charlestown, Massachusetts. Three years later he abruptly resigned and went into business with his wife. He stayed in touch with Ballou; their letters were later published as *A Series of Letters, in Defence of Divine Revelation; in Reply to Rev. Abner Kneeland's Serious Inquiry into the Authenticity of the Same.* At the urging of the general convention, he returned to the ministry in 1816, this time in Whitestown, New York. His reservations about religion surfacing again, Kneeland continued voraciously reading skeptical writings. He was transferred to Philadelphia in 1818.

After more than twenty-five years as a Baptist, then Universalist, minister, Kneeland's growing RATIONALISM led him to become a frequent contributor to Robert Dale OWEN and Frances WRIGHT's paper, the *FREE ENQUIRER*, and to edit the *Olive Branch and Christian Inquirer*, a newspaper devoted to "free inquiry, pure morality and rational Christianity." In 1829, after inviting Wright, a noted freethinker and labor and women's rights advocate, to speak to his congregation, he requested, and was granted, permission to withdraw himself from the fellowship of Universalists.

Kneeland went to Boston and began lecturing on rationalism, leading a group called the First Society of Free Inquirers, and founded the *BOSTON INVESTIGATOR*, the first rationalist journal in the United States. In its December 20, 1833, issue, he printed a letter stating among other things that "Universalists believe in a god which I do not; but believe that their god, with all his moral attributes, aside from nature itself, is nothing more than a chimera of their own imagination." In addition, he also printed two other articles, for which he did not claim authorship but for which he bore legal responsibility as editor. One had to do with the Virgin Birth and was considered profane in its language; the other was a mocking criticism of prayer.

He was summarily charged with violation of the 1782 Act against BLASPHEMY for publishing "a certain scandalous, impious, obscene, blasphemous and profane libel of and concerning God." He was convicted in the municipal court and appealed the conviction. After two mistrials with two different lawyers in the Massachusetts Supreme Court, Kneeland represented himself, successfully arguing his case regarding the two articles not penned by him. However, the jury determined his letter about the Universalists had indeed denied the existence of God, thus breaking the law. Despite Kneeland's claim that he was not an atheist but a pantheist, the original conviction was upheld. He again appealed, and four years after the original indictment the case was heard by the full state supreme court. Chief Justice Lemuel Shaw presided and handed down the guilty verdict, with Justice Marcus Morton dissenting. Kneeland served sixty days in the Suffolk County jail. One hundred seventy people signed a petition calling for a pardon, including Theodore Parker, Ralph Waldo EMERSON, and William Lloyd Garrison. No action was taken, however, and despite public outcry Kneeland served his time. While in jail, he wrote and published a review of his own trial, conviction, and imprisonment.

After his release, Kneeland resigned as editor of the *Boston Investigator* and, in the spirit of his friend and utopian founder Robert Dale Owen, moved west to Salubria, Iowa, on the banks of the Des Moines River, to join a colony planned by the First Society of Free Enquirers. The colony project never came to fruition, but Kneeland stayed on the farm, running for the legislature on his Free Thought ticket (he lost) and teaching school (his schoolhouse blew down in a storm) until his death in 1840 at the age of seventy-one.

JULIE HERRADA

KNIGHT, MARGARET (1903–1983), English rationalist whose broadcasts on humanism were notorious. Margaret Knight spent the greater part of her professional life as an academic psychologist at the University of Aberdeen, where her husband, Rex Knight, led the psychology department.

She "had the moral courage to throw off my beliefs" while in her third year at Cambridge University, under the influence of the philosophers Bertrand RUSSELL, J. M. E.

McTAGGART, and C. D. Broad. She came to believe deeply that she should speak out to support those many people who held covert humanist beliefs. The public media was then deferential to the waning Christianity of the time.

She approached the BBC in 1953 with a script setting out her "affirmations of unbelief," and was immediately rejected. She was "prepared to make a nuisance of herself" and persisted in her approach. Eventually it was agreed that she would talk about moral education for children of unbelievers. These became what were the infamous two talks on "Morals without Religion" in 1955. They sparked an uproar in the press and vociferous letters to the BBC. Headlines brayed about "The Unholy Mrs. Knight" and journalists wrote of her as a menace. More thoughtful Anglicans conceded that she should be argued with rather than denigrated. A third broadcast in the series featured a discussion between Margaret Knight and Mrs. Jenny Morton, a former missionary, on the upbringing of children.

Morals without Religion and Other Essays contained the texts of her talks and a description of the reaction they engendered, together with essays on other subjects which interested her such as evil, telepathy, intuition, and statistics.

Throughout the remainder of her career she lectured on humanism at almost all the British universities. She became an Honorary Associate of the RATIONALIST PRESS ASSOCIATION and contributed to the *Humanist.*

In response to Bishop J. A. T. Robinson's *Honest to God* (1960), a description of God as "the ground of our being" which gained wide attention in the UK, she wrote a rejoinder volume, *Honest to Man.* In 1961 she produced a *Humanist Anthology from Confucius to Bertrand Russell,* prompted by discussions of humanism with students that led her to realize that there was a need for much more knowledge of the historical humanist tradition. A new edition extensively revised by this author was published in 1995 and remains in print.

JIM HERRICK

KNOWLTON, CHARLES (1800–1850), American birth control pioneer. The first person in the history of the birth control movement (see BIRTH CONTROL AND UNBELIEF) to be imprisoned for advocating and writing a booklet on birth control, Charles Knowlton was a freethinker (see FREETHOUGHT) who did some unusual and unrespectable things in his younger years. Born in rural Worcester County, Massachusetts, to a moderately well-off family, the youthful Knowlton studied medicine with various area physicians. Unhappy over his lack of knowledge of anatomy, he broke into the local graveyard, removed a recently deceased corpse, and dissected it. He apparently continued to rob graves, because he later spent two months in jail for performing illegal dissections. After his father paid more than $250 to secure his release from jail, he went on to attend lectures at Dartmouth Medical School, from which he received a medical degree in 1824.

Extremely ambitious, Knowlton wanted to be regarded as a new John LOCKE, and to this end he wrote and self-published a book, *Elements of Modern Materialism.* When it did not sell anywhere near the one thousand copies he had ordered, he had to sell his household goods to satisfy his creditors and return to the practice of medicine. He opened up an office in Ashfield, Massachusetts, a town of about eighteen hundred people. Ever the nonconformist, he delighted in scandalizing local churchgoers by playing his violin on Sunday mornings as they passed his house.

Knowlton found his cause in birth control. Concerned that young couples often suffered financial burdens because of too-frequent births, and recognizing that numerous pregnancies led to ill health among mothers as well, he decided in 1832 to publish a booklet titled *Fruits of Philosophy, or the Private Companion of Young Married People, by a Physician.* Apparently it sold well, since a second edition was published in 1833. Knowlton recommended douching immediately after intercourse with, among other things, a solution of alum with infusions of almost any available astringent herb, such as raspberry leaf or hemlock bark. Since alum has spermicidal effects, this formula was probably somewhat effective. He also recommended a douching solution of zinc sulfate, as well as formulas incorporating other compounds, which would not have been particularly effective.

Knowlton gave lectures in various towns in order to sell his book. He was fined in 1832 in Tautnon, Massachusetts, and in 1833 he was jailed at Cambridge for three months. A third attempt to convict him in Greenfield, Massachusetts, failed. One of the effects of his legal troubles was to further publicize his book, which by 1839 had sold ten thousand copies. *Fruits of Philosophy* continued to be published throughout the nineteenth century, mostly by various freethought presses. Knowlton or those publishing his book added supplementary information to later editions. The last authorized US edition was published in 1877, but it continued to be published in England with somewhat revised content after that. It was in England that *Fruits of Philosophy* was involved in the famous Bradshaw-Besant trial (see BIRTH CONTROL AND UNBELIEF; BRADLAUGH, CHARLES; BESANT, ANNIE).

Knowlton's many critics accused that following his recipes would encourage people to engage in illicit intercourse, but he argued that if a woman's chastity could be overcome with the knowledge his book imparted, it could also be overcome without it. Others claimed that birth control was against nature, but Knowlton answered that civilized life was one continuous battle against nature, and that birth control methods would not change that. Rather *conception* control, he said, would prevent overpopulation; mitigate the evil of prostitution; reduce poverty, ignorance, and crime; help prevent hereditary diseases; preserve and improve the species; and prevent ill health among women who would otherwise suffer from excessive childbearing or habitual abortions.

Knowlton himself largely retired from the battle over birth control in the early 1840s. Some measure of his standing among his fellow physicians can be seen with his election in 1844 as a fellow of the Massachusetts Medical Society. He continued to write articles on a variety of medical topics until his death.

KNUTZEN, MATHIAS (1646–?), German atheist pamphleteer. Born in Holstein, Mathias Knutzen studied theology and caused controversy by his sermons. He came to the university town of Jena in 1674 after traveling extensively throughout Germany. After distributing several handwritten pamphlets, he fled to Altdorf and is said to have died in Italy. His pamphlets explained that some people all over Europe took their knowledge and conscience as the sole criterion for rightness and goodness. He declared that there was no God, that he despised authority, and that he rejected the church and its priests. There was only one life, and neither reward nor punishment was to be expected after death. If there was a God, Knutzen asked in his pamphlets, where had he come from? Knutzen contended that the Bible was not holy but a contemptible scripture, confused and dark, without coherence and sense, just a fable.

KOTARBINSKI, TADEUSZ (1886–1981), Polish philosopher. Tadeusz Kotarbinski was a leading representative of the Lvov-Warsaw school in philosophy, which was related in spirit to the Vienna Circle (see SCHLICK, MORITZ, AND THE VIENNA CIRCLE). For many years, Kotarbinski was the chairman of the Department of Logic at Warsaw University, then the president of the Polish Academy of Science (1957–62) and of the Institut International de Philosopie (1960–63). He was a member extraordinary of the British Academy, and received honorary doctorates from several universities in Poland and abroad. His main domains of scientific research were ontology, in which he developed his own version of nominalism, called reism; epistemology, in which field he defended EMPIRICISM and RATIONALISM; praxiology or general methodology, of which he was a pioneer; philosophical logic, which was his main subject of teaching and the subject of his most comprehensive book, the so-called *Elementy*; and ethics, in which he developed the concept of independent ethics, that is, secular ethics free of any religious assumptions. But Kotarbinski always considered teaching to be his principal calling. He had numerous disciples of different generations, strongly influencing the way of thinking of large group of people who owe to him their strict intellectual standards and moral values.

As the best attitude toward other people, he suggested the attitude of reliable carer, one who is ready to help when help is needed and to protect others (including animals) against suffering. He himself could be the personal model of this attitude, being unusually sympathetic toward people and sensitive to all forms of harm and injustice. Prior to World War II he strongly protested against racism, especially anti-Semitism, and religious intolerance in Poland. As a member of the Freethinkers' Society, he published many articles in its journal, the *Rationalist*, demanding separation between the church and the state, condemning racial and religious discrimination at Polish universities, and arguing for the right to free expression of opinions in public life. He was hated by Catholic militants and conservatives, who derided him as a representative of Bolshevism.

In spite of his materialist and leftist views, he never accepted Marxism, which became the officially promoted philosophy in Poland after World War II. Kotarbinski considered this philosophy to be much akin to religious doctrines. So he was classified by Marxist authorities as an idealist bourgeois philosopher. For some years he was allowed to teach only logic, not philosophy. Political liberalization after Joseph Stalin's death made it possible for him to teach freely and to publish his philosophical works, even to hold the

highest academic office. Nevertheless, he remained sharply critical of the limitations on freedom under the Soviet system.

After the change of political system in Poland in 1989, the Catholic Church regained its dominant role in public life. As a result, recent efforts have been made to cause Kotarbinski to be forgotten, or at least to diminish recognition of his contribution to Polish intellectual culture.

BARBARA STANOSZ

KOVOOR, ABRAHAM (1898–1978), Indian rationalist and debunker of god-men. Abraham Thomas Kovoor represents a colorful era in the history of the Asian rationalist movement (see RATIONALISM). His direct and trenchant criticism of all kinds of spiritual frauds and organized religions excited audiences wherever he appeared and initiated a new dynamism in the rationalist movement, especially in India (see INDIA, UNBELIEF IN).

Born at Tiruvalla in Kerala, India, on April 10, 1898, Abraham was the son of Reverend Kovoor Eipe Thomma Katthanar, the vicar general of the Mar Thomma Syrian Church of Malabar. He was educated at Serambur Bengabasi Colleges at Calcutta. After working briefly as a junior professor in Kerala, he migrated to Sri Lanka, where he spent the rest of his life. He taught botany in several colleges and retired as a professor at Thurston College, Colombo, in 1959. After retirement Kovoor devoted his life to the rationalist movement. He spent most of his time building up the Ceylon Rationalist Association and was elected its president in 1960—an office he retained until his death. He edited an annual journal, the *Ceylon Rationalist Ambassador*. In 1961 he traveled in Europe and established contact with the World Union of Freethinkers there (see FREETHOUGHT). Kovoor wrote articles in newspapers and magazines in Ceylon about his encounters with the paranormal under the pseudonym "Narcissus"; these became popular. These articles were translated and published in India, first in Malayalam by Joseph Edamaruku (using Kovoor's actual name instead of the pseudonym "Narcissus") and later in other Indian languages.

In the 1960s and 1970s Kovoor traveled in India several times and addressed hundreds of meetings. His brilliant oratory enlivened with his scientific approach and the spirit of critical thinking had an almost magical effect on audiences in Indian villages and towns. Kovoor led four "miracle exposure" lecture tours in India, all organized by the Indian Rationalist Association, and challenged and exposed the "miracles" performed by so-called god-men. During his last journey to India in 1976, Kovoor visited the ashram of India's most prominent god-man, Sai Baba, and famously challenged him to face a test of Kovoor's devising, an offer the god-man refused.

Kovoor died on September 18, 1978. "I am not afraid of death and life after death," he wrote in his will. "To set an example, I don't want a burial." He donated his eyes to an eye bank and his cadaver to a medical college for anatomy studies. He wanted his skeleton to be given to the science laboratory of Thurston College. Everything was done according to his last wishes.

SANAL EDAMARUKU

KREKEL, MATTIE (1840–1921), American freethought-liberal lecturer and author. Mattie Krekel began her career as a Spiritualist trance speaker and traveling lecturer for liberal reform. She was a speaker for the New York Freethinkers Association and was appointed vice president of the AMERICAN SECULAR UNION in 1885, drawing the admiration of Robert Green INGERSOLL.

Spiritualist Beginnings. The child of liberal parents, to whom she was grateful for discouraging her from religious orthodoxy, Mattie Hulett was born in Indiana on April 13, 1840. Her earliest connections to liberal reform came through Spiritualism, closely connected in the nineteenth century to freethought. Her first lecture on the liberal platform took place in Rockford, Illinois, at the age of fifteen. Her advent as an adolescent female speaker was typical of Spiritualist lecturers following the Fox sisters' popularization of the movement in 1848. Young women were considered more open to spirit communication, and trance speaking empowered women like Mattie to more freely address controversial topics in an era in which "spirits" were more likely to receive polite attention than women.

After her marriage to T. W. Parry in 1862 and the births of her six children, she continued working as a traveling lecturer through the 1870s appearing as a delegate from Illinois to the 10th Annual Convention of the American Association of Spiritualists in Chicago in 1873, and as a speaker at the Spiritualist Camp Meeting in Dubuque, Iowa, in 1876.

Freethought and Secularism. Her work continued in the 1880s after her marriage to her second husband, Austrian-born US District Court Judge Arnold Krekel, himself also an agnostic lecturer. She shared with him the honor of

addressing the New York Freethinkers Association, a group that first met in Watkins Glen, New York, to advocate scientific inquiry, civil rights, and liberal reform, and that hosted such notable speakers as Amy Post, Ingersoll, D. M. BENNETT, and Matilda Joslyn GAGE.

In 1885 she was appointed vice president of the American Secular Union. In his opening speech at the American Secular Union convention in Albany, Ingersoll commended Mattie Krekel for her courage of self-expression both as a woman and as a freethinker. Following her husband's death in 1888, she continued to ably express her courageous unconventional opinions in an article appearing on February 15, 1890, in *THE TRUTH SEEKER* in which she equated freethought with self-assertion.

MELINDA E. GRUBE

KROPOTKIN, PËTR (1842–1921), Russian anarchist-evolutionist activist. Pëtr Kropotkin was born in Moscow on December 9, 1842, the son of a wealthy prince. His childhood was typical of the Russian nobility, with the exception that his mother died when he was three. At age fifteen, he became a page at the court of Nicholas I at Saint Petersburg and attended a prestigious school attached to the court. The education he received was somewhat liberal; for example, he was able to study the French Encyclopedists (see *ENCYCLOPÉDIE, L'*, AND UNBELIEF). He excelled in the study of science.

After completing his education at Saint Petersburg, Kropotkin fulfilled his military duties. His interest in geographic science led him to join or lead several survey expeditions into Manchuria, Siberia, and Finland. These expeditions would be instrumental both in Kropotkin's development as a scientist and in his later embrace of anarchism (see ANARCHISM AND UNBELIEF). Kropotkin's reports on these expeditions were well received by the scientific community, so much so that Kropotkin was offered a position with the Imperial Geographical Society. But during his years in Siberia he had lost faith in government; he turned down the appointment, opting instead to pursue helping humankind through anarchism.

Kropotkin's Ideas. During his time in Siberia, Kropotkin had realized that a web of small, almost autonomous towns and villages offered a more commodious way of life than large states ruled by impersonal, bureaucratic governments. In large part his anarchist philosophy developed from this realization. But he also came to understand as central to village life the process by which independent persons come together for mutual benefit. He also visited a group of village watchmakers in Switzerland, confirming what he had learned in Siberia. After his return from Switzerland, he stated he had become an anarchist from that point forward.

He then began applying this insight to other areas, including evolutionary theory. During this time frame, many "social Darwinists" (actually far removed from Charles DARWIN) had made a fetish of "survival of the fittest" (see DARWINISM AND UNBELIEF; SPENCER, HERBERT), depicting competition between species as the only force driving evolution. Kropotkin's experiences showed him that on the contrary, cooperation played a significant role. From this began his work on the theories that would later be published in his best-known book, *Mutual Aid* (1902).

In opposition to social Darwinist views, Kropotkin believed that all creatures were basically cooperative, and that when it was possible to do so, one creature would generally help another. He found this to be true among animals as well as human beings. For Kropotkin, Darwinian natural selection was the leading factor in individuals' competition to survive and reproduce, but cooperation became the dominant factor at the species level. The emphasis Kropotkin placed on cooperation offered a significant counterweight to the ruling social Darwinism of the day, and helped to guide the development of evolutionary theory into a more reasonable direction.

Kropotkin was also an optimist regarding human nature. It was his opinion that when small autonomous collectives had replaced the state, everyone would be eager to work because competition would be inoperative and people would want to be busy.

Kropotkin's Activism. Following his refusal of the geographical post, Kropotkin devoted his full energies to the international anarchist movement. He participated in the founding of numerous anarchist journals, was imprisoned several times, and spent forty years in exile, much of it in England. In 1892 he published his seminal anarchist work, *The Conquest of Bread.* Published ten years before *Mutual Aid*, it reflected many of the same ideas. In plain language that could be understood by all he described his ideal of "anarchist communism," essentially the sharing of all, by all, and for the benefit of all. His anarchism, his belief in human goodness, and his theory of mutual cooperation were all blended in this work.

Kropotkin's exile ended with the February Revolution. He returned to Russia in June 1917. After he returned to Russia, he was not treated kindly by the Bolsheviks. He was forced to move several times before settling in a small village called Dmitrov, where he lived basically in exile, cut off from information about the outside world. He died in poverty on February 8, 1921.

TIMOTHY BINGA

KWANZAA. Noted Afrocentrist and nontheist Maulana Karenga created the Kwanzaa celebration in 1966, during the heyday of the Black Power movement in the United States. The purpose of the celebration—held from December 26 to January 1—is to promote black pride, unity, and respect for African culture, values, and traditions.

Kwanza means "first fruits" in Swahili. Karenga added an extra *a* to the end of the word to distinguish it from *kwanza* celebrations held throughout Africa. Various first fruit celebrations have been held in ancient Egypt and Nubia, Ashanti land, Yoruba land, South Africa, southeastern Africa, and Central Africa.

Karenga, who speaks fluent Swahili, laid out the *Nguzu Saba*, or "Seven Principles of Blackness," in the seven days of Kwanzaa:

- Umoja (Unity): For the family, community, nation, and the black race.
- Kujichagulia (Self-Determination): For determining the collective future and destiny of black people.
- Ujima (Collective Work and Responsibility): For the building of the black community and striving for solutions to the problems that afflict black people.
- Ujamaa (Cooperative Economics): For pulling together the economic resources of the black community for collective empowerment.
- Nia (Purpose): For the building of a black community that will be conducive to black greatness.
- Kuumba (Creativity): For finding creative ways to build a better black community.
- Imani (Faith): For believing in ourselves and our parents, our teachers, our leaders, and our ancestors.

Notably, faith is celebrated on the seventh and final day. Though celebrants may define faith in their own way, Karenga has secular ideas in mind. Indeed, he is always careful to point out that Kwanzaa is a cultural celebration rather than a religious observation. He believes the celebration could help combat some of the divisiveness of organized religion.

Some of the objects used during Kwanzaa include the following:

- The *kinara* candleholder, which holds seven candles (one black, three green, and three red). The colors represent black people (the black), the blood shed by African people (the red), and the color of the motherland (green). Marcus Garvey popularized the colors with the African liberation flag during his heyday.
- The *mbeka*, or placemat, which is preferably made from straw.
- The *mazao*, or crops, particularly fruits and vegetables.
- The *vibunzi/muhindi*, ears of corn that represent each child in the household.
- The *kombe cha umoja* or *kikombe cha umoja*, the communal unity cup.
- The *mishumaa*, the actual candles used throughout the celebration.

Celebrants pour libations (*tambik*) to the ancestors and decorate their houses in African motifs, using red, black, and green. The kwanzaa *karamu*, or feast, is traditionally held on December 31. Those celebrating New Year's Eve are advised to hold the feast earlier in the day.

Karenga and other Kwanzaa celebrants bristle at the charge that it is simply a "black Christmas." Most celebrants are against the commercialization of Kwanzaa. Gifts are supposed to be inexpensive and homemade, as opposed to expensive and store-bought. However, many businesses still manage to make a lot of money by selling Kwanzaa cards and other gifts; and many businesses use the holiday to advertise their products and services.

Kwanzaa has had other critics as well. For example, the African American scholar Gerald Early believes that African Americans have no genuine connection to African culture as promoted by Kwanzaa. Furthermore, some conservatives have said that the celebration is merely a racket to promote Afrocentric scholars. Others have charged that whites have been prevented from attending some Kwanzaa gatherings.

Despite what its detractors say, Kwanzaa is celebrated by millions of people throughout the world, and has gained mainstream acceptance. In 1997 the US Postal Service issued a 32-cent postage stamp in honor of the celebration, and its popularity continues to grow.

NORM R. ALLEN JR.

LABOR AND UNBELIEF. Throughout history churches and other religious institutions have relied on the finan-

cial support of their constituents. Clerics are paid more or less directly by those to whom they provide spiritual guidance. So it is natural that religious institutions become a microcosm of society as a whole, with all its class structures. The poorer a given institution's congregants, the less money it has. Conversely, customs arise by which the rich can buy their way into the institution's good graces, leaving the poor and working class to wait their turn. Common practices such as the sale of pews reserve access to the best seats for the wealthy, relegating the poor to "back of the bus" status. Moreover, the rich can simply build a new church or synagogue in order to have a place of worship separate from the undesirables.

Though the labor movement has pronounced connections to ATHEISM, FREETHOUGHT, and ANTICLERICALISM, in fact well-known champions of labor hail from both sides of the religious divide. From Karl MARX to Dorothy Day, those who seek to abolish capitalism or simply to reform existing labor laws to bring about a more equitable society have come to their convictions from various perspectives. Regardless of their approach, their motives are the same.

Welsh atheist and labor reformer Robert OWEN published controversial pamphlets critical of religion and the church. He founded an industrial partnership in a mill town called New Lanark, near Glasgow, Scotland. There he set his ideals for labor reform into practice, reducing the hours in the workday, establishing strict sanitation habits, and opening a school for workers' children that included dancing as part of its curriculum. Eventually Owen found his way to the United States, where he established the community of New Harmony, Indiana (see WRIGHT, FRANCES). There he invoked a nonreligious set of principles, including the substitution of ethical lectures for religious worship, public care of children, and cooperative labor practices. Owen also published a freethought newspaper, the *New Harmony Gazette*.

New Harmony ultimately failed and Owen returned to Great Britain, but he did not cease his activities. He founded the London Cooperative Society and the Equitable Labor Exchange, which issued labor notes in exchange for hours of work, and continued to be openly critical of religion, although he managed to escape BLASPHEMY charges. Many of his progressive ideas were eventually realized. Child labor laws, the establishment of bureaus of labor statistics, and the eight-hour workday are significant labor reforms that can be traced to Owen.

German philosopher and socialist Karl Marx did not argue about the existence of God, but distinguished the unachievable pie-in-the-sky promises offered by religion from what he viewed as the achievable objectives of materialism as a means to end capitalism and the oppression of the working class. His oft-paraphrased dictum "Religion is the opium of the people" has a deeper meaning when quoted at fuller length. In the introduction to his *Contribution to the Critique of Hegel's Philosophy of Right* (1844) he wrote: "Religion is the sigh of the oppressed creature, the heart of a heartless world, just as it is the spirit of a spiritless situation. It is the opium of the people."

In 1905 Vladimir Ilyich LENIN characterized the oppression of the working class as both social and spiritual slavery, asserting that a class-conscious worker "leaves heaven to the priests and bourgeois hypocrites." Lenin believed that all socialists are atheists. Though he was not opposed to freedom of religion, he thought the state should regard religion as a private matter, insisting that the Russian Revolution enforce separation of church and state in order to prevent coercion in matters of religion. He believed this was imperative if political freedom were to be achieved.

Lenin urged workers to demand that corrupt clergy abandon their privileges and join in their struggle in response to their ultimatum that "the class-conscious Russian workers will declare ruthless war on you." He felt it necessary, however, to relegate the issue of religion to the background, and to deal with economic and political struggles first. Once the workers were emancipated, in his view, atheistic consciousness would follow, although not automatically. There should still be an organized fight against religious doctrine; at the same time, care should be taken not to offend believers unduly, since this could backfire and result in fortification of religious fanaticism.

The trade unions that emerged in Europe during the nineteenth and early twentieth centuries were Marxist-dominated and conspicuously antireligious. Christian workers tended to avoid these unions, a tradition that continues to the present day. To protect their constituencies European churches established their own trade union federations. These were largely impotent in terms of achieving labor reform, but they separated the believing workers from the unbelievers. According to Christian labor historian George Higgins, the Dutch Catholic Church established a mandate that "decreed that Catholics should belong to Catholic unions and no others." The dichotomy between believing and unbelieving workers was essentially complete and enduring.

For their part, activists of the militant labor movement consistently regarded religion as an oppressive tool of the ruling class. This reflected a long tradition of corruption within the churches of Europe at the expense of peasants and workers. In revolutionary times, labor activists generally pursued a zero tolerance policy toward religious institutions and their patrons. When mass uprisings of workers and peasants occurred, clergy were often among their first targets.

In Spain anarchists and labor revolutionaries directed their attacks at crooked clergy and the Catholic Church, which, with the help of fascist governments, exerted an irresistible stranglehold on the peasants (see ANARCHISM AND UNBELIEF; FERRER, FRANCISCO). In 1923 the Spanish anarchists Francisco Ascaso and Torrès Escartin opened

fire on a car carrying Don Juan Soldevila Romero, the cardinal-archbishop of Saragossa, mortally wounding him. Soldevila was widely known as a corrupt and powerful cleric, responsible for a violent and repressive crackdown against the Spanish people in the decade leading up to the Spanish Revolution. During the Spanish Civil War (1936–39) anarchists burned churches and ran out the clergy in retaliation for their collusion with the fascists.

American trade unions were not nearly as antireligious as their European counterparts. One of the first union federations in the United States was the late nineteenth-century Knights of Labor, which welcomed nearly every kind of worker except "bankers and bartenders." Although Catholics elsewhere were forbidden to join the Knights, American bishops saw the union as a way to win the favor of Catholic workers. This avoided a split in the labor movement between Catholics and other workers, as had occurred in Europe and Canada. A few decades later, as anti-Communist sentiment began to burgeon in the United States, the church came to the forefront of efforts to run Communists, real and imagined, out of organized labor.

If even Lenin had been cautious about criticizing religion for fear of scaring away the faithful masses, one important union displayed no such caution. Even before its official formation in Chicago in 1905, the Industrial Workers of the World (IWW) was open and unabashed in denouncing not only religion, but the clergy as well. As a labor union, the IWW was (and still is) unsurpassed in militancy and radical political methods, including direct action. One of its founding members and a principal author of the IWW Preamble was a radically antireligious former priest named Thomas J. Hagerty, who was not the least bit timid about his views. Without attacking religion itself, he and others were quick to point out the antilabor activities of the church and were successful in attracting many atheist workers.

The line "Pie in the sky—that's a lie!" won national popularity in the song "The Preacher and the Slave" (1911) by Joe Hill. Perhaps the most famous Wobbly (IWW activist) and a proud atheist, Hill was executed on dubious charges by the state of Utah. "The Preacher and the Slave" is now thought to be the most popular antireligious song in US history. The IWW's unofficial atheistic position was threatening enough that the church struck back, attacking the union for supposedly being immoral and sinful. However, while the union was vehemently antireligious, its attacks were usually aimed at greedy and duplicitous clergy and not so much at the teachings of the Bible. Although IWW propaganda often depicted Christ as the "hobo agitator of Nazareth," the union's stand was that the church was a tool of the capitalist class and therefore an enemy of the worker. No other union condemned the church so openly and persistently, in the pages of its newspapers as well as in the lines of its songs and poetry. The union's *Little Red Songbook* ("Songs for the Workers to Fan the Flames of Discontent") was rife with such lyrical and inventive creations.

Any discussion of the labor movement and atheism must include such progressive believers as the Catholic Workers and the Liberation Theologists. Despite their ties to the church, their political ideals were extremely radical. The larger conservative wing of the church tried to distance itself from these groups, but was unable to ignore them completely.

Peter Maurin, a French anarchist and former cleric, left France in 1909 and lived and worked in Canada and the United States before settling in New York City in the late 1920s, where he became "an agitator for Christ." His anarchist principles kept him leery of trade unions, but Maurin believed the capitalist system was inherently unethical and corrupting, and he was particularly influenced by the Communist anarchism of Pëtr KROPOTKIN.

Despite receiving her political education from the socialists, anarchists, and the IWW, Dorothy Day converted to Catholicism in 1927. Day met Maurin in 1933 and together they founded the Catholic Worker movement. Under Day's editorship, the movement's newspaper, the *Catholic Worker*, was ardently pro-labor; established Catholic Worker groups aided strikes by picketing and by providing meals to strikers and by giving publicity and moral support. Off the picket line, its activities centered on voluntary poverty, pacifism, and social justice activism. Its anarchist style—autonomous communities with no central authority, no board of directors, no salaries, and no federal tax-exempt status—continues to be practiced today in more than 130 communities.

Day and others, such as the monsignors Charles Owen Rice and George W. Higgins and Father John Corridan, are only a few of the radical Catholics who have devoted their lives to labor reform. Their faith somehow led them to understand that the economic system lay at the root of society's problems.

Succeeding the Catholic Workers by several decades, the aim of the Liberation Theologists was similar to that of the Marxists: to bring about economic equality and help establish a better life for the poor and working classes. Rooted in the Christian Left, it gained influence in Latin America in the late 1960s; several influential congresses were held in the early 1970s.

Apart from the IWW, the American labor movement today remains deeply rooted in Christianity, although labor struggles in general seem to have been abandoned by left-wing religious activists. Unions continue to lose clout and membership, representing less than 8 percent of the private-sector work force.

LAÏCITÉ. The term *laïcité* is used primarily in Romance-language countries with a strong Catholic tradition. In English the word *secularism* is often substituted, but that word does not completely translate *laïcité*, as *laïcité* connotes a form of organization of society itself and also of public venues. *Laïcité* comes from the Greek word *laos*, meaning the people who compose society. It refers to a way of organizing society which achieves a real separation between the public space and its institutions (which are common property) on the one hand and the churches with their different religious or philosophical convictions (which pertain to sphere of citizens' private concerns) on the other.

Only when the state is *laïque*—that is, when it successfully implements *laïcité*—can it guarantee impartial treatment of and true equality for all citizens, whatever their convictions. On this view, only *laïcité* can guarantee total freedom of conscience, freedom of thought, and of religion.

***Laïcité* in France.** Near the end of the eighteenth century, both France and Belgium witnessed the earliest steps in the "laïcization" of civic institutions. Responsibility for the administration of so-called civil register certificates (acknowledging births, marriages, and deaths) passed from the clergy to public authorities. Public authorities also began to recognize the right to divorce (forbidden by the church) and to extend equality for all, to the great advantage of Protestants and Jews.

In the nineteenth century France stood divided between two ideological camps. The liberal, *laïque* France supported human rights; it confronted a conservative Catholic France that opposed what it called the "pernicious freedoms"—freedom of thought, of religion, of the press—and human rights. Catholic France was particularly outspoken in supporting Pope Pius IX's reactionary encyclical "Quanta Cura" with its infamous Syllabus of Errors (1864). Moreover the French Catholic Church had openly opposed the ideals of the French Revolution and was intensely antirepublican. Because of this historical confrontation, *laïcité* has often been seen as antireligious. In fact, *laïcité* is not antireligious, though it is anticlerical insofar as it has sought to put an end to the social power of the clergy (see ANTICLERICALISM).

By the progressive separation of church from state, *laïque* activists sought to preserve and expand religious freedom. Among its earliest propagandists were well-known individuals including Benjamin Constant, Jules Michelet, Edgar Quinet, Lamennais, and the poet Lamartine. In the second half of the nineteenth century, FREETHOUGHT organizations and the Masonic lodges of the Grand Orient of France, among others, emerged as defenders of separation.

In 1905 France passed a historic law known as the Law on Separation of Churches and State. It states in part: "The Republic ensures freedom of conscience. It guarantees the free exercise of religion. . . . The Republic does not recognize, remunerate nor subsidize any religion." Yet even this law allows the state to pay the salaries of chaplains and to subsidize the maintenance of (predominantly Catholic) places of worship. Today the implementation of this law poses problems because Islam (now France's second most important religion) remains excluded from it.

***Laïcité* in Belgium.** Since the nineteenth century Belgium developed legislation concerning "recognized religions" which is also based upon the principle of separation of churches and state. In contrast to France, the ministers of six "recognized religions" (Roman Catholicism, Reformed Protestantism, Anglicanism, Judaism, Islam, and Orthodoxy) are paid by the state. In the early 1970s, so-called nonconfessional organizations serving nonbelievers and humanists (see HUMANISM) federated, demanding—on grounds of the *laïque* principle of equality of citizens—treatment equal to that given to religious organizations. Advocates argued that humanism is also a LIFE STANCE, nonreligious and no less respectable than any religious conviction. This activism culminated in a 2002 law that also provides state-funded salaries for the delegates of nonconfessional organizations, including humanist counselors and celebrants.

***Laïcité* in Civil Society.** The claim for a *laïque* society and the defense of a nonconfessional, humanistic personal ethics complement one another. *Laïcité* is thus seen a twofold concept, on the one hand implying a neutral and impartial state, on the other hand calling for humanistic citizens who will defend the principle of *laïcité*.

In countries with a strong *laïque* tradition, then, *laïcité* operates in effect as a life stance in its own right. This life stance is neither a new religion nor a mere rejection of religion. Far from being limited to a simple atheism or

agnosticism, it encompasses a full commitment to humanism with an explicit ethical dimension. As a humanist life stance, it holds that men and women should not seek for some preexisting and abstract understanding of the meaning of life, such as one handed down by a god; rather men and women must undertake the labor of constructing their own meanings for human existence and human actions.

Contrary to theocratic or authoritarian regimes that invariably seek to interfere in the private sphere of conscience, the secular (*laïque*) state guarantees freedom of religion and of conviction. Moreover it is the only one to do so. Political secularism is the patrimony common to all democrats, whether religious or not; thus it is in no way the monopoly of agnostics, atheists, and humanists.

In fact, it is fortunate that the democratic will to secularize the State is not the preserve of "heathens" alone, but is rather the common aim of all democrats. By the same token, all citizens should welcome the recognition that the search for meaning in life—for "spirituality," if one will—is neither the exclusive preserve of religions.

Pluralism of conviction must be guaranteed in part so that dialogue is possible—not just predictable interactions between experts or high dignitaries, but a true grassroots dialogue among citizens of differing life stances, conducted in a setting of equality. On the *laïque* view, this can only be guaranteed if the state and public authorities observe a true impartiality between citizens of every philosophical and religious conviction, allowing each to blossom in the private sphere.

PHILIPPE GROLLET AND GEORGES C. LIÉNARD
TRANSLATED BY EDITH NAGANT

LA METTRIE, JULIEN OFFRAY DE (1709–1751), French atheist philosopher. Julien Offray de La Mettrie, a medical doctor, was one of the most outspoken materialistic writers of the eighteenth century. His uncompromising description of humans as material beings and denial of an immaterial and immortal soul made him famous all over Europe as "Mr. Machine."

Life and Principal Works. La Mettrie was born in the port of Saint-Malo in Britanny, where he practiced as a doctor after his medical studies and his degree from Reims University. In 1733 and 1734 he stayed in Leyden to attend the lectures of the renowned Hermann Boerhaave. He afterward presented himself as Boerhaave's pupil and translated the great teacher's works, as well as publishing his own medical observations. He went to Paris in 1742, became doctor to the French Guards, and took part in military campaigns, as well as mixing in philosophical and libertine circles.

His first openly irreligious work, *Histoire naturelle de l'âme* (Natural History of the Soul), was published clandestinely in Paris in 1745 and was immediately seized by the police and burned by the Paris Parlement. In 1746 La Mettrie left France for the more tolerant Holland, and published his notorious *Homme machine* (Machine Man) in Leyden in 1747. It caused such a scandal that he had to leave the country rapidly for fear of being arrested and found refuge at the court of King Frederick II of Prussia. Here he published *L'Homme-plante* (Man a Plant; 1748) and a translation of Seneca's *De vita beata*, with an introduction that was reworked in 1750 and 1751 as *Anti-Sénèque* (Anti-Seneca), posthumously retitled *Discours sur le bonheur* (Discourse on Happiness). In 1750 he published *Système d'Epicure* (System of Epicurus).

Philosophy. These works contained a gradually more outspoken materialistic explanation of humans in terms of sensitive living matter that, when properly organised in the brain, can produce thought. He came to deny the existence of any human soul or divine providence, claiming that the whole world was the result of natural configurations of living matter. He thus, despite the deliberately provocative title of his most famous work, rejects Cartesian dualism and combines mechanistic explanations with various medical theories concerning vital matter. He also draws on the Epicurean tradition and takes arguments from the irreligious works which circulated clandestinely in eighteenth-century France. He denies the existence of any absolute moral values and insists that humans are determined by their physical makeup; his claims that education cannot produce social behavior and that only coercion can ensure social peace led to his rejection by other atheistic philosophers, despite the influence of his works on their own materialism.

LAMONT, CORLISS (1902–1995), American humanist activist. Corliss Lamont was an active member of the humanist movement (see HUMANISM), especially the AMERICAN HUMANIST ASSOCIATION, which he supported financially over many years. Lamont was a lecturer in the Department of Philosophy of Columbia University and served on the board of the *Journal of Philosophy*. The son of Thomas Lamont, a business partner of J. P. Morgan, Corliss supported many left-wing causes.

Among Lamont's many interests were his belief in civil

liberties and democracy. He publicly battled Sen. Joe McCarthy and later the US State Department, which had denied him a passport. But according to Sidney HOOK and others, Lamont was also an apologist for some of the worst excesses of Communist totalitarianism (see LENIN, VLADIMIR ILYICH; MARXISM; SOCIALISM AND UNBELIEF). Hook registered this objection in a 1981 letter to the editor in *Free Inquiry* magazine, sparking a passionate exchange of views between Hook and Lamont in subsequent issues. Although never a member of the Communist Party, Lamont was accused of being a "fellow traveler." Clearly he did not recognize the totalitarian character of Stalinism and Leninism until late in life. As head of the American-Soviet Friendship Committee, Lamont maintained that Stalin's Moscow purge trials were unreal.

In his 1974 book *Voice in the Wilderness*, Lamont penned a statement in which he withdrew his earlier views about the Moscow purge trials and criticized the Soviet Stalinist dictatorship for its denial of civil liberties and democracy.

Lamont was a defender of the philosophy of naturalistic humanism (see NATURALISM; SECULAR HUMANISM). He was a secular rather than a religious humanist (see RELIGIOUS HUMANISM) and he criticized John DEWEY for using the term *God* in his book *A Common Faith*. Lamont believed that one could live an authentic life here and now without any reliance upon a deity, and that this was possible through the application of reason and science.

Corliss Lamont's important humanist books were *The Philosophy of Humanism* (1957), which outlined the main principles of humanism; and *The Illusion of Immortality* (1935), which criticized the concepts of the soul and the afterlife.

PAUL KURTZ

LATIN AMERICA, UNBELIEF IN. Background. With the arrival of the Spaniards and Portuguese in the sixteenth century in what is now known as Latin America, Ibero-America, Indian-America, or *America Mestiza*, the predominant and official religion of the aboriginal peoples became Roman Catholicism. Previously they had lived in advanced civilizations, worshiping their sovereigns and the forces of nature, but now Catholicism was imposed and made mandatory by the conquistadores through blood, sword, and fire. In addition, native peoples were heavily evangelized, even as they were ruthlessly dominated and exploited. Catholicism remained as the only legal religion until the end of the nineteenth century.

The Counter-Reformation, Catholicism's response to the Protestant Reformation centered in Europe, made its influence strongly felt in Latin America. From the sixteenth to the eighteenth centuries, the Tribunal of Holy Inquisition pursued, tortured, and killed not only aboriginal practitioners of idolatries but also heretics (see HERESY), unbelievers, and Jews, the latter with special ferocity.

The nineteenth century saw the rise of fighters for independence, including Venezuela's Francisco de Miranda and Simón Bolívar, Argentina's José San Martin, and Cuba's José Martí. These were liberal Freemasons and presumably deists (see DEISM); they generally favored a limited religious tolerance, especially toward Protestant evangelicals, and put into place some secularizing laws. Other prominent figures were open freethinkers (see FREETHOUGHT) and highly critical of the Catholic clergy (see ANTICLERICALISM), including the Peruvian anarchist writer Manuel González Prada, the Peruvian liberal writer Ricardo Palma, the Colombian author José María Vargas Vila, the Argentinean educator Domingo Faustino Sarmiento, and the Mexican lawyer Benito Juárez. The latter two rose to govern their countries; Mexico's Juárez even instituted reforms that confiscated church lands.

Successful, generally populist political activists including Argentina's Juan Domingo Perón, Mexico's Lázaro Cárdenas, Peru's Victor Raúl Haya de la Torre, and Brazil's Getulio Vargas confronted clerical power at least one time in the twentieth century.

Liberal movements, especially POSITIVISM, played an important role in the secularization and consolidation of the nascent Latin American countries during the second half of the nineteenth century and the first half of the twentieth. In Brazil, for example, with the installation of the republican system in 1889, the motto of Auguste COMTE, "Order and Progress," was placed on the national flag. At the same time, a law separating church from state was put into effect. Reform went so far that the prescribed closing greeting used in official state correspondence was changed from "God save you" to "health and fraternity." A Positivist Church was founded with the motto "Love the Principle and Order the Basis, Progress the Aim." It meets on Sundays to the present day. In Uruguay, under the liberal President José Batlle y Ordóñez, the names of religious holidays were secularized. Christmas became the "day of the family," Easter the "week of tourism," and so on. Political institutions were declared autonomous from military and ecclesiastical control and a secular public school system was instituted. The 1857 Mexican constitution prohibited ecclesiastical entities to have real estate and abolished any ecclesiastical privileges. That year President Juárez confiscated church properties, canceled all religious orders, and gave power to the state governors to choose what buildings could be for religious services. Mexico's first religious civil war was between 1857 and 1860 in reaction to the secular laws. The constitution of 1917 institutionalized many of the nineteenth-century secular reforms and had the most

extensive restrictions on the Roman Catholic Church. In the middle 1920s and until the late 1930s, various federal and state administrations enforced the constitutional edicts and related law against the church. That produced the second Mexican religious war, the Cristero Rebellion of 1926–29. So the Vatican and Mexico broke relations, which were not restored until 1992. And only in 2003 was abortion made partially legal in Mexico.

In Peru in the second half of the nineteenth century, liberal legislators succeeded in passing laws to establish secular cemeteries, civil marriages, religious tolerance, and lay education, as had already been done in Brazil, Uruguay, and Chile. But by 1979, Peruvian affairs had moved in the opposite direction: in that year the military government and an apostolic nuncio signed a concordat by which Peru exempted Catholic Church properties from taxation, exempted priests from income taxes, and pays salaries to clergy and schoolteachers who lead Catholic religion courses in the public schools. Such courses were made obligatory in the constitution of 1979. The most recent Peruvian constitution, adopted in 1993, again privileged the relations between Peru and the Vatican. In 2004 there was a failed effort to modify the constitution and declare a real separation between the Catholic Church and the Peruvian state. Among those fighting for separation are homosexual and feminist groups, and even some Christian groups, Catholic and otherwise.

In 2004 Argentina's capital, Buenos Aires, recognized same-sex civil unions. In 2005 Chile became the last country in the Americas to legalize divorce.

As for anarchist and socialist ideas, while these were already widespread across the region in the first decades of twentieth century, it was with the Cuban revolution of 1959—soon declared socialist and Marxist by its leader, Fidel Castro—that Marxist political ideology and atheistic philosophy gained numerous followers in Latin America and the third world—even Communist parties included many believers as members. But after the fall of European Communism, Castro's dictatorship favored relationships with official Catholicism. And several anarchist organizations across the rest of Latin America have enjoyed a more or less mild resurgence, as they have in other parts of the world; some of these movements continue in a minimal way to spread the historic ATHEISM and anticlericalism of their founders. There are even some Christian anarchist groups. The Marxist rebel groups of the late twentieth century met diverse fates. Those that could survive civil war, persecution, and slaughter were variously able to hide inside their countries, to abandon them, to surrender or sign a peace treaty, to be formalized, or simply to become social-democratic or environmentalist parties.

The nations of Latin America remain numerically Roman Catholic, despite rapid recent increases of interest in other religions, especially Protestant evangelicalism, Eastern religions, and indigenous cults. Catholicism retains its exclusive privileged relationship with most governments and armed forces across the region. On the other hand, some Catholic practice takes a syncretic form, blending elements drawn from American or even African aboriginal religion.

The Rationalistic Groups: Humanist and Skeptical. Even as other non-Catholic minorities have expanded, national censuses and opinion surveys reveal a significant increase in the number of citizens who declare themselves unbelievers in religion or skeptical of paranormal claims. As in the rest of the world, this increase seems related to disillusionment among serious students of Bible, and to growing exposure to critical thought and scientific knowledge, in educational systems and especially in cyberspace.

Among the earliest Latin American rationalistic groups were the Humanist Association of Argentina, active in the late 1960s and 1970s, and the Argentinean Center for the Investigation and Rebuttal of Pseudoscience, which published the newspaper *El Ojo Escéptico* (Skeptical Eye), active during the 1990s. Following on the Humanist Ethical International Conference in Costa Rica in 1995 and the Thirteenth Humanist World Congress in Mexico in 1996, there has been an explosion in the formation of organized rationalistic groups. At the same time a diverse group of individuals has emerged through mass media and the Internet who foment secularism, criticism of religious beliefs, the popularization of science, or criticism of paranormalist beliefs. Some have committed to the full range of these agendas.

These groups and individuals vary widely in their level of activity. The most active publish articles in print, via electronic bulletins, or on the World Wide Web; some also publish books, organize public meetings, and offer distinctive merchandise. Others exist formally or virtually, that is, they have ceased to publish and organize meetings some time ago, while their Web sites remain available to visit.

It must be underlined that not all groups and activists use the adjectives *humanist* or *skeptical* in their names. In addition, even more so than in other regions, in Latin America *humanist* doesn't always mean "secular humanist" or "unbeliever." As is the case worldwide, academicians and experts in humanities or human or social sciences describe themselves as humanists, though many are religious. Other sources of lexical confusion with regard to the word *humanist* are more idiosyncratic to Latin America. For example, Brazil's Humanist Party of Solidarity and the Peruvian humanist movement both have social-Christian tendencies. A so-called humanist movement was founded by Silo, an Argentinian once called "the Messiah from the Andes," and spawned humanist parties following his ideas. Siloism advances an eclectic collectivist philosophy with no relation to rationalistic secular humanism.

A few Latin American humanist associations are already members of the INTERNATIONAL HUMANIST ETHICAL UNION (IHEU) and the Center for Inquiry (CFI), but a majority of the Ibero-American skeptical organizations

remain independent. Humanist organizations vary in their offerings—for example, only some offer humanist ceremonies like name giving or marriage (see RITUAL, CEREMONIAL, AND UNBELIEF). They need to increase their memberships substantially in order to enjoy fully developed democratic organizations like the humanist, rationalist, and atheist groups of India, and to expand their financial bases in order to enjoy economic independence like the European and North American organizations. Of course the developed countries have a very different economic, social, and political history.

The table below provides current information from online sources regarding Latin American rationalistic groups and associations.

LATINO LITERATURE, UNBELIEF IN. "Latino literature" refers to literary works, mostly in English, produced by people living in the United States who trace their ancestry to the Spanish-speaking countries of Latin America. With a current estimated population of more than forty million, Latinos, also called Hispanics, constitute the largest "minority" in America and they are providing new expressions of unbelief in American literature. The Latino population can be subdivided into four major subgroups: Mexican Americans (20.6 million), Puerto Ricans (3.4 million), Cuban Americans (1.2 million), and Dominicans (765,000). (Population figures are rounded and derived from the 2000 US Census.) The term *Chicano* is not as relevant in this context, being a self-identification used by some Mexican Americans particularly during the 1960s and 1970s.

The Latino religious experience has its roots in the Latin American religious experience, whose distinctive character resides in the particular, triadic mixture of religious traditions that have interacted only during the last five hundred years. Prior to 1492, Native Americans had never mixed with either Europeans or Africans. US Latinos have transferred and adapted that Latin American religious experience to the United States. In addition, US Latinos are undergoing a rapid shift from Catholicism to Protestantism.

Mexican American Literature. Mexican American history itself begins in 1848, when a large section of Mexico became part of the United States. For much of the nineteenth century and most of the twentieth century, authors such as Fray Angélico Chávez either expressed outright adoration of Catholicism or did not criticize religion or Catholicism directly. Antonio Villarreal's *Pocho* (1959), sometimes hailed as the first Chicano novel, marks the first significant espousal of ATHEISM by a Latino or Latina literary protagonist. In that story a young boy, Richard Rubio, experiences a journey from belief to unbelief as he enters adolescence. His questioning of Catholic dogma is intertwined with his emerging sexual awareness.

In the 1960s and early 1970s, a number of Mexican American authors began vociferous critiques of the Catholic Church and of organized religion in general. One of the most vocal was Oscar "Zeta" Acosta, who disappeared mysteriously in 1974. Once a Protestant, Acosta eventually left Christianity altogether. In *The Revolt of the Cockroach People* (1973), Acosta assailed the Catholic church for its oppression of Chicanos. Tomás Rivera centered his work . . . *And the Earth Did Not Swallow Him* (1971) on a young boy's growing suspicion that neither the devil nor God exist, especially in light of the evil that existed in a Chicano migrant farmer's world. In 1972 Rudolfo Anaya published *Bless Me, Ultima*, which quickly became a classic of Mexican American literature. Opting for a sort of pantheistic eclecticism, Anaya includes a scathing critique of organized religion, particularly Catholicism. Anaya also includes a strong and sympathetic atheist character who is persecuted for his unbelief.

Happy Birthday, Jesús (1994) by lawyer Ronald L. Ruiz is one of the most caustic attacks on Catholicism ever published in American literature. Ruiz has stated that he does not practice Catholicism or any kind of religion. *Happy Birthday, Jesús* presents the story of a young man named Jesús Olivas, who kills his sexually abusive priest in Fresno, California. Jesús also has a deep hatred for his grandmother, who abuses him with strict interpretations of Catholicism. The story suggests that the very theology of the Catholic church does not help society, but rather creates violent sociopaths. The fact that one can be forgiven easily, through confession and penitence, is an incentive to sin.

Unbelief has strong representation in feminist authors, who although not atheists, are skeptical of organized religion. Gloria Anzaldúa is perhaps the best-known Mexican American feminist writer. Her book *Borderlands/La*

Frontera: The New Mestiza (1987) outlines a strong rejection of Christianity in favor of indigenous Mesoamerican traditions. Ana Castillo penned a strong indictment of an androcentric Catholicism in *So Far from God* (1993), premised on the idea that all religious traditions should be judged by how they serve the needs of women.

Puerto Rican Literature. Puerto Rico became a territory of the United States in 1898, but Puerto Rican literature on the mainland came into full force in the aftermath of great migrations (mostly to New York City) after World War II. Some of the earliest expressions of unbelief in religion may be found in the work of Jesus Colón, an avowed Communist, who wrote *A Puerto Rican in New York and Other Sketches* (1961). Piri Thomas, who grew up in New York City, wrote some gritty works, including *Down These Mean Streets* (1967) and *Savior, Savior, Hold My Hand* (1972), that outline his dissatisfaction with the racist nature of Christianity. Ed Vega critiques many religious traditions in *The Comeback* (1985), a farcical expression of Ludwig FEUERBACH's thesis that God is a human creation.

Cuban American and Dominican Literature. The direct literary expression of unbelief among Cuban Americans and Dominicans has been negligible. Cuban American literature is best dated from 1959, when many Cubans came to the United States in the aftermath of the Communist takeover of the island by Fidel Castro. The reluctance to express unbelief is perhaps due to the fact that many Cuban Americans see themselves as fleeing an atheistic Communist government. Dominicans have not yet produced nearly the volume of work of the other subgroups in America. However, in *How the Garcia Girls Lost Their Accents* (1991) Julia Alvarez, the best-known Dominican American writer, portrays a growing secularization of characters after their immigration to America. Consumerism becomes the new religion. A similar secularization theme is found in *Dreaming in Cuban* (1992) by Cristina Garcia, a Cuban American whose alter ego in that book becomes disdainful of religion.

Conclusion. Despite the fact that most Latinos and Latinas describe themselves as religious, there is a small but notable group of Latino/Latina literati who openly espouse atheism or manifest SKEPTICISM toward organized religion. Otherwise, many Latino writers often resemble Anglo-American writers who have constructed eclectic and individualized forms of religion. Overall, Hispanics have already provided new expressions of unbelief that are only expected to increase as the Latino/Latina population grows even larger.

LAW, THE, AND UNBELIEF. Since ancient Greece, at the very least, atheists, agnostics, and other freethinkers (see ATHEISM; AGNOSTICISM; FREETHOUGHT) have suffered legal prosecution as "infidels." The famous trial of SOCRATES was conducted to correct the wrongs he committed by "corrupting" the youth of Athens in teaching them to think and question even the religious dogma of their parents. Strange, then, that PLATO (who chronicled the trial of Socrates) thought that infidels ought to be executed. In his *Republic*, Plato makes "impiety" a criminal offense, subject to punishment by imprisonment of five years for the first offense, and by death if convicted twice.

In the second century of the common era, Christians were grouped with atheists as infidels under Roman law. The legal status of infidels is apt to shift over time as one religion becomes dominant and others fade. Turning the table, Saint Thomas Aquinas suggests that non-Christian infidels should be "exterminated from the world by death," but due to his Christian mercy, he thinks that should not occur until the third offense. As long as polities and churches were commingled either directly (as with the Holy Roman Empire and other theocracies) or less directly through monarchs whose authority stemmed from divine right, disbelief amounted to treason. BLASPHEMY and infidelity were offenses against the state itself, and atheists as well as members of minority religions were equally liable to legal action. During the Inquisition, this legal action meant swift and terrible justice by execution of atheists and other heretics, but it is arguable that modern law, as divorced from action by or on behalf of a state church, is an entirely different sort of creature.

Legal institutions, created separate and apart from churches, are meant to dole out justice and offer some minimum form of what we call "due process." These secular institutions have for some time nonetheless been the instruments of persecution via prosecution of atheists and agnostics. When embarked upon under the auspices of due process, the legal persecution of nonbelievers is especially odious; even so, it continues throughout the world to this day. The most remarkable forms of legal prosecutions for atheists and other infidels are for blasphemy, which crime is defined as some sort of direct challenge to religious dogma which warrants legal action. What is noteworthy about such prosecutions is that trials for blasphemy have been conducted outside of the church, by jurists, and under the color of the common law, even relatively recently.

Blasphemers. Of course, blasphemers have been tried and executed by religious authorities throughout the ages. Churches acting in various instances as judicial authorities either with the support of the state, or in the

state's stead, have meted out such punishments since the dawn of religion. Christianity has been adept at carrying out such prosecutions, notably under the auspices of the Spanish Inquisition. Only the most liberal interpretation of the term *judicial* could make these proceedings part of a legal institution in the most modern sense. Appellate procedures were lacking or laughable, rules of evidence capricious. But blasphemy as a crime reared its ugly head even under modern legal systems at various times.

In 1676 Chief Justice Sir Matthew Hale in Britain developed the common law rule of blasphemy in a prosecution of a man for declaring the Bible to be a "cheat." Hale opined that "Christianity was part and parcel of the law of the land," and so one issuing blasphemous statements violated the common law and could be legally punished. By the close of the seventeenth century, numerous challenges to traditional notions of the Trinity encouraged passage of a British law making such blasphemers legally accountable. That act was partially repealed in 1813. Notable blasphemers subjected to legal action as well as social and professional stigma included Thomas WOOLSTON and John LOCKE. John Stuart MILL made himself liable to prosecution for his lectures calling into question the divine authority of the Bible in 1851.

Prosecutions under English common law and blasphemy statutes continued in the American colonies as well. The original law of the Connecticut colony, for instance, punished blasphemers with death. Under Maryland law, it was a crime even in the early twentieth century "to blaspheme or curse God or write or utter profane words about our Saviour Jesus Christ or of or concerning the Trinity or any of the persons thereof" (Md. Ann. Code [Bagby, 1924] art. 27, sec. 24). In the United States, however, which instituted a facially secular constitution whose authority stemmed from the people rather than God, blasphemy was usually not itself illegal, with the notable exceptions of Maryland, Maine, and Massachusetts. (In this connection, however, it is worth noting that a Massachusetts court went out of its way in *Commonwealth v. Kneeland*, 20 pick 206 [Mass. 1838] to hold that orthodox Christian belief was true, and other faiths mere "chimera" and products of "imagination" (see KNEELAND, ABNER). Even when not being specifically punished for blasphemy, "blasphemous contracts and associations" have suffered under the law. In the United States, a contract for leasing rooms as a forum for lectures concerning the potential untruth of Christ's teachings was held to be illegal as late as 1867 (*Cowan v. Milbourn*, L.R. 2 Ex. 230). In 1870 a Pennsylvania court held that the "Infidel Society of Philadelphia was not entitled to receive a bequest because it was illegal, despite the legal incorporation of the society, and the technically correct manner of the bequest's language and execution" (*Zeisweiss v. James*, 63 Pa. 465). Prosecutions for blasphemy were for some time supplanted by prosecutions for "obscenity." Notably, Charles C. MOORE of Lexington, Kentucky, edited the freethought journal the *Blue Grass Blade*, and was prosecuted under the state's obscenity laws and subsequently served jail time in 1899. His crime was to publish speculation as to the divine nature of Jesus. In 1891 Moses HARMAN, the editor of an anarchist and free-love publication named *Lucifer, The Light Bearer*, published in Topeka, Kansas, also served jail time for publishing obscene materials speculating about established religious dogmas (see SEX RADICALISM AND UNBELIEF).

The applicability of the First Amendment's Establishment Clause took some time to be settled with regard to the states, even after the passage of the Fourteenth Amendment, and so disestablishment in the States is still not settled according to some stalwart theocratic Justices. (In his written opinion in the *Newdow* decision regarding the use of "under God" in the pledge, US Supreme Court Justice Clarence Thomas went out of his way to make his legal case that somehow the First Amendment's Establishment Clause is not applicable to the states even though the rest of the First Amendment apparently is.) As early as 1811, Chancellor Kent of New York offered an explanation for disparate treatment of non-Christians, arguing that members of religious minorities and other infidels were "imposters" (specifically discussing Muslims who at the time outnumbered Christians worldwide), and infidels had no rights before a court in a Christian nation such as the United States (*People v. Ruggles*, 8 Johns 291 [N.Y. 1811]).

Moreover, atheists, agnostics, and other infidels have been subject to legal action and discrimination under the law in subtler, though not less harmful, ways.

Oaths and Impeachment. Atheists, agnostics, and others who profess no belief in a god of vengeance or in an afterlife system of rewards or punishments had long been legally prevented from giving testimony under oath. The rule was derived from English common law and survived until rather recently in US federal and state law, either by practice, common law, or by statute. Even when an atheist was permitted to testify, his or her lack of religious faith could be used to impeach the credibility of the witness. Thus, in a Tennessee case in which a civil judgment was awarded to an atheist, the defendant appealed on the basis that he was not allowed to inquire as to the plaintiff's disbelief in "God or a future state of rewards and punishments." The cause was remanded for a new trial, and the plaintiff lost after receiving the condemnation of the Supreme Court of Tennessee, which added insult to injury, stating, "The man who has the hardihood to avow that he does not believe in a God, shows a recklessness of moral character and utter want of moral sensibility, such as very little entitles him to be heard or believed in a court of justice in a country designated as Christian" (*Odell v. Koppee*, 5 Heisk. 88). New Hampshire's appellate court said similarly: "He who openly and deliberately avows that he has no belief in the existence of a God, . . . is unworthy of any credit in a court of justice" (*Norton v. Ladd*, 4 N.H. 444).

As recently as 1929 this rule was used in at least two

cases in North Carolina to discredit the testimony of self-professed communist strikers who were also not so coincidentally atheists. In the 1920s and 1930s, this rule was almost exclusively used in prosecutions of reputed communists and other liberal "agitators." As of 1938, seven states explicitly prohibited testimony from anyone professing disbelief. Eight others allowed impeachment of the witness on the basis of his or her disbelief. In other words, a witness's atheism or status as an "infidel" could be used to suggest to a jury that his or her testimony was questionable. This author knows of at least one case in New York State, involving a defendant on trial for manslaughter who had named himself "Calvin of Oakknoll," whose atheism was used to show that he supposedly lacked regard for human life. He lost the last of his many appeals via writs of *habeas corpus* and died in prison. This happened in the 1990s. The author's knowledge is based on his work for the New York State attorney general's office in countering the appeal.

This principle has also been used to justify the exclusion even of jurors who will not swear on a Bible. Again, a Tennessee court held that the atheist juror could "not hold any office . . . because he could not take an oath—he cannot be trusted" and that he was "an evil genius in a sacred place" (*McClure v. State*, 1 Yerger [9 Tenn.] 207).

The theory of excluding the testimony of atheists, or preventing them from sitting in judgment on a jury, has been that their disbelief in a God of vengeance who metes out punishment in an afterlife fails to act as a deterrent to lying to disbelievers. Absent from this analysis is an examination of how a forgiving God might excuse worldly lying for the faithful, who by all accounts lie on the stand just as frequently, if not more so, than do atheists.

Other, more egregious, fates than being prohibited from testifying or having testimony discredited have been met by atheists under US law. One legal rule that effectively encouraged the assassination of atheists and other infidels is a judicially carved exception to the rule of dying declarations.

Dying Declarations. One particularly odious legal rule which treated the atheist, agnostic, or infidel differently under the law was the rule regarding "dying declarations." Typically, the unsworn, out-of-court statements of another are inadmissible by quotation in court. This is the age-old rule of hearsay. The justification for the rule is that the person who is alleged to have made a statement is not available in court to verify it, and there is no way to probe its truth. There are a number of exceptions to the rule, one of which is that of "dying declarations." A dying declaration may be admissible for the truth of the matters asserted in it because of the presumption that one who is dying has no reason to lie; he or she has nothing to gain by it. Another part of the assumption is that deathbed declarations are presumptively true because of the imminence of death, and the dying person's fear of the salvation of his or her everlasting soul . . . so again, merely having nothing to gain by lying is apparently not enough—rather fear of the consequences of lying is what makes such statements presumptively valid under the rule as it long stood (see also Deathbed Claims concerning Unbelievers).

Naturally, given the religious explanation for the validity of deathbed statements, it is clear how the rule might be challenged for nonbelievers. The net effect of the challenge, and of exclusion of such declarations, is what is truly frightening. The United States Supreme Court stated (*Carver v. U.S.*, 164 U.S. 694): "[Dying declarations] . . . may be discredited by proof that [the deceased] did not believe in a future state of rewards or punishments." The rule has been used in far too many cases to protect Christians accused of the murders of infidels.

In a Missouri case from 1920, two men were found by a jury to be guilty of murder. They shot an allegedly peaceable, elderly, and ill man. His sons found him dying from several bullet wounds, and he told his sons the manner and cause of his fatal injuries, as well as who exactly the assailants were. The trial court did not permit the defendant's attorney to inquire into the dead man's alleged atheism. The Supreme Court of Missouri held that the trial court's exclusion of evidence of the dead man's atheism was a reversible error (grounds for reversing the prior verdict), and remanded the case back to the trial court with instructions that the evidence of atheism should be admitted and could be used to help undermine the dead man's credibility (*State v. Rozell*, 225 S.W. 931).

The Court of Appeal of California held that the dying declarations of nonbelievers must never be admitted without a specific admonition by the court that the jury *must* view such statements "with great caution" (*People v. Lim Foon*, 155 Pac. 477). In New York the medieval reasoning behind this rule was upheld by a court stating that "no testimony is entitled to credit, unless delivered under the solemnity of an oath, which comes home to the conscience of the witness, and will create a tie arising from his belief that false swearing would expose him to punishment in the life to come" (*Jackson v. Gridley*, 18 Johns. 98).

The rule is clearly derived from that regarding the giving of testimony and swearing of oaths, but when applied to the exception of dying declarations, unmistakably makes it open season on atheists. Ironically, this rule contradicts the oft-stated myth that "there are no atheists in foxholes," which rests on the assumption that, seeing death as imminent, atheists almost invariably repent and become believers. If that were so, wouldn't all deathbed declarations be presumptively believable, as even atheists would be, at least at that moment, as trustworthy as any believer?

Instead, dying atheists are treated under the rule of dying declarations as presumptively evil. As a Missis-

sippi court noted, "the law presumes, not that they will be converted, that being a remote possibility, for between them, as with the devil, whose subjects they be, and the Christians, there is perpetual hostility, and can be no peace" (*Heirn v. Bridalut*, 37 Miss. 209, 226).

The logic of this exception to the hearsay exception holds for all infidels, agnostics included, as well as Unitarians (see UNITARIANISM TO 1961; UNITARIAN UNIVERSALISM) and others who do not share a belief in a vengeful God and a future state of rewards and punishments. This is the explicit language and reasoning of the US Supreme Court in the *Carver* decision cited above.

A West Virginia court made plain the net result of the dying declaration exception as applied to nonbelievers, stating: "His goods may be stolen, his dwelling broken into by the midnight robber, or burned by the incendiary; his child may be beaten, or his wife murdered before his face, and the offender escape because of the incapacity of the injured man to give evidence against him" (*State v. Hood*, 59 S.E. 971).

Holding Public Office. Even in enlightened times, it has been the law in several states that atheists, agnostics, and other infidels could not be sworn in to hold public office. Once again, the practice originates in the inability or unwillingness of atheists to swear oaths, but in a number of cases the principle has been extended to amount to explicit prohibition. As late as 1953, prior to the *Torcaso* decision (*Torcaso v. Watkins*, 223 Md. 49, 162 A.2d 438, 364 U.S. 877 [1960]), eight state constitutions required belief in God in order to hold public office. By extension, the prohibition would act to prevent even civil service by atheists in those states. This was so despite the US Constitution's provision in Article VI declaring that "no religious test shall ever be required as a Qualification to any Office or public Trust under the United States."

As with other discriminatory practices against atheists, this rule would apply even to certain Christians. For instance, in Maryland, the law required belief in "either a present or future divine punishment" as well as a belief in God (Md. Const. art. 37. Other state laws as of 1960 included: Ark. Const. art. 19, sec. 1; Miss. Const. art. 14, sec. 265; N.C. Const. art. VI, sec. 8; PA Const. art. I, sec. 4; S.C. Const. art. XVII, sec 4; Tenn. Const. art. IX, sec 2; Tex. Const. art I, sec. 4.) Obviously deists, Unitarians, Universalists (see UNIVERSALISM TO 1961), Quakers, and other liberal Christians who reject a notion of hell or of a vengeful God, would be technically disqualified from holding office under the Maryland rule.

In some states, the belief in God and of a future state of rewards and punishments was required simply to *vote* (S.C. Const. of 1778, Art. XIII). South Carolina was one of those states that, even as late as 1895, maintained that "[n]o person who denie[d] the existence of a Supreme Being shall hold any office under this Constitution" (S.C. Const. of 1778, Art. I sec. 4). Massachusetts and Maryland denied the office of governor to all except Christians, and in New Hampshire, North Carolina, New Jersey, and South Carolina, only Protestants could be governor.

These restrictions and similar legal iniquities directed against atheists were effectively declared unconstitutional under the *Torcaso* decision, by which the Supreme Court held that state constitutions' provisions requiring a belief in God were unconstitutional deprivations of liberty. The enforceability of these provisions in the present day is at least doubtful, but certainly may be apt to change with the resurgence of fundamentalism.

Conclusion. The laws of theocratic states existing today methodically discriminate against both unbelievers and "infidels," but, as discussed above, theocratic systems of law by which the church and state are the same entity do not amount to what we would consider as justice in a modern state. Law as a social institution, with a system of courts and a principle of "rule of law," has nonetheless been used as an instrument of persecution by *religious people* even where it has not been under the direct authority of any particular *religion*. This possibility, as described in the instances and examples above, is worth noting. That secular legal systems such as that of the United States and those of the various American states have been used to persecute unbelievers even until modern times challenges the notion that somehow atheism is not a civil rights issue. It clearly is.

In sum, a number of common law and statutory forms of outright discrimination have existed in the laws of both England and the United States. The spirit behind them continues to motivate fundamentalists to enact new laws—or to seek enforcement of existing laws—in ways designed to abrogate the civil rights of unbelievers. The history of such discrimination teaches us that we ignore those motivations at our peril.

DAVID KOEPSELL

LAW, HARRIET (1831–1897), English feminist and freethought lecturer. Born Harriet Teresa Frost in Ongar, Essex, her early experience was as a strict Baptist. When

her father's farm failed, the family moved to London, where she ran a school and Sunday school. At the Philpott Street Secular Hall, she met freethinkers such as Charles BRADLAUGH, Charles SOUTHWELL, and George Jacob HOLYOAKE. By the time she married secularist Edward Law in 1855, she too held secularist beliefs. In 1859 she began to lecture in her own right.

She lectured throughout the country for over twenty years. She was said to have great command of an audience, a quick memory, and a powerful ability to deal with hostile audience members. Her polemical skills were assisted by her deep knowledge of the Bible. Compared with the educated and polished Annie BESANT, Law was sturdy and steadfast, having, according to George W. FOOTE, "a powerful common-sense kind of eloquence."

She was based in Birmingham, and from 1876 to 1878 took over the running of the *Secular Chronicle*, which had been begun by Birmingham printer George Reddalls in 1872. According to Foote she made a mess of it, but the *Chronicle* was sustained and its scope was widened to include republicanism, cooperative ideas, the International Working Men's Association, and women's rights. Freethought publishing was not a route to financial success, and it is thought she lost one thousand pounds through the venture. She was the first freethought publisher to give space to Karl MARX. She and the journal remained impartial during the dispute within the NATIONAL SECULAR SOCIETY (NSS) over the defense of the birth control pamphlet *The Fruits of Philosophy* (see BIRTH CONTROL AND UNBELIEF), and was neutral regarding the resistance to the authoritarianism of Bradlaugh.

Harriet Law was active in the national movement and was offered, but refused, the vice presidency of the NSS in 1867 and 1876. She was elected to the general council of the International Working Men's Association in 1867. In 1878 her health began to decline, and she was inactive in the movement for the rest of her life. While not an intellectual, she was according to Bradlaugh, "earnest [and] brusquely honest."

JIM HERRICK

LEA, HENRY CHARLES (1825–1909), American historian, publisher, and philanthropist. Henry Lea was born into a Philadelphia book-publishing dynasty begun in colonial times by his maternal grandfather, Matthew Carey. He was privately tutored and did not attend college. During adolescence, and as a young man beginning his responsibilities at the publishing firm, Lea pursued varied literary and scientific interests as an autodidact. He published poetry, translations from ancient and modern languages, and empirical scientific papers.

At twenty-two, while convalescing from illness brought on by overwork, Lea read French court memoirs and was fascinated. He set out to write the history of the coercive aspects of the medieval church using an objective scientific methodology. Understanding the jurisprudence, economics, and geopolitics behind the events would benefit his study of that history, much as understanding physics and chemistry benefits the study of life sciences.

Lea developed a worldwide network of correspondents and booksellers for procuring all pertinent research materials. He bought or borrowed when possible, and when necessary had archival materials copied out by paid copyists. From those resources grew Lea's massive fifty-year output of books and articles on such topics as the Inquisition (*A History of the Inquisition of the Middle Ages*, 1887; *Chapters from the Religious History of Spain Connected with the Inquisition*, 1890), priestly celibacy (*An Historical Sketch of Sacerdotal Celibacy in the Christian Church*, 1867), priests as unpunished sex offenders (*Studies in Church History*, 1883), and the prosecution of witches, demon exorcism, and the marketing of indulgences (*A History of Auricular Confession and Indulgences in the Latin Church*, 1896). They were groundbreaking works in their day and most are still a pleasure to read.

For Lea, rule by a monolithic prelacy exemplified the harm arising from religion. His writings reflected his apprehensions about an ascendant Roman Catholic Church in the United States.

Lea was a pillar of the Republican Party and the Union League. He took charge of local recruitment—including African Americans—for the Union army. "The Bible View of Slavery," a pamphlet by Bishop John Henry Hopkins, was seriously touted as justification for the Confederate cause: in 1863 Lea published a pseudonymous, albeit scripturally accurate, satire, "The Bible View of Polygamy," in response.

Lea's publishing interests—specializing increasingly in medical and scientific books—and his real estate holdings flourished. He was among the largest benefactors of institutions of learning, libraries, and hospitals in southeastern Pennsylvania. He was a high-profile opinion leader, exerting influence on a wide range of public policy matters.

Lea declared no religious stance of his own. No personal religious crisis shaped him. Among his forebears, diverse religious traditions—including Roman Catholicism—were represented. He did contribute financially

to the First Unitarian Church in Philadelphia, and its emeritus pastor gave his eulogy. Lea's library, papers, research materials, and the reassembled oak-paneled library room from his Walnut Street mansion, are housed in the Van Pelt Library of the University of Pennsylvania.

EDMUND D. COHEN

LEIBNIZ, GOTTFRIED WILHELM VON (1646–1716), French philosopher, mathematician, and Enlightenment figure. Gottfried Wilhelm von Leibniz was referred to by his contemporaries as the last man who knew everything. While not true, it was also not much of an exaggeration. A genuine polymath, in addition to making important contributions to philosophy and mathematics he was also a historian, librarian, diplomat, physicist, legal advisor, linguist, and scholar; he exemplified the Enlightenment thirst for knowledge.

The son of a professor of moral philosophy at the University of Leipzig, Leibniz was extremely well educated. Eschewing a career in academia, he spent most of his life as a diplomat, serving the dukes of Hanover in various professional capacities which entailed his traveling throughout most of Europe. This both broadened his knowledge of the world and increased his concern to find a solution to the growing religious warfare that was raging at the time.

Leibniz was a critic of much of the religious thinking of his time, but was by no means an unbeliever. In fact, he is perhaps best known—other than for codiscovering the differential and integral calculus—for his defense of the deity in light of the problem of evil (see EVIL, PROBLEM OF), in his famous work from 1710, *Essais de Théodicée sur a bonté de Dieu, la liberté de l'homme et l'origne du mal* (Essays of Theodicy on the Goodness of God, the Liberty of Humankind and the Origin of Evil). In it, he made the claim that God could have created the world any way he wished, and since he is all good, it must be the case that this is the best of all possible worlds. The cause of suffering is due to the gift of free will, which allows humans to perform heinous acts but also prevents them from being mere puppets. This answer to the problem of evil proved wanting, and was mercilessly parodied in VOLTAIRE's classic work *Candide*, where Leibniz's views are expressed by the ridiculous character Doctor Pangloss (which means "All Tongue").

Hoping to develop a comprehensive system of knowledge based upon logical principles, Leibniz was wary of the materialistic philosophy of René DESCARTES. However, partly because of his myriad activities and partly because of an inability to focus his attentions, he was never able to produce the grand unifying work of philosophy he hoped would overcome the growing influence of ATHEISM and religious differences.

In his quest for international peace, Leibniz devised a scheme to unite Protestantism and Catholicism by focusing on their areas of agreement; when this came to naught, he focused his attentions on bridging the gaps between Western and Eastern thought. He was fascinated by the information Christian missionaries were sending back to Europe about China and the Far East, and speculated as to why these countries seemed to have such moral citizens even without knowing the message of the Holy Bible. He jocularly wrote that the Chinese should send missionaries to civilize the Europeans. Leibniz's follower Christian Wolff, a pious Christian, was deprived of his chair in philosophy in 1721 because of his praise for CONFUCIUS. He had argued that Confucian ethics and Christian ethics were compatible. Immanuel KANT, another great Enlightenment figure, was trained in the Leibniz-Wolff tradition, and his own influential work "Toward a Perpetual Peace" (1796), which postulated a prototype for the United Nations, was based in part on Leibniz's dream of a world united by rational principles, where religious and national differences would be overridden through the common pursuit of truth.

TIMOTHY J. MADIGAN

LEICESTER SECULAR SOCIETY, THE. The Leicester Secular Society was a leading British regional secularist group in the second half of the nineteenth century; its Secular Hall is the only building erected by an English secularist or freethought group of that period still under its original ownership.

Leicester, a town in England's East Midlands, had a radical tradition of Owenites (see OWEN, ROBERT) and secularists in the 1840s and 1850s. Engineer Josiah Gimson and tailor William Holyoak (no relation to freethought leader George Jacob HOLYOAKE) were prominent in this movement. It is claimed that the Leicester Secular Society was founded in 1851, but although the group existed intermittently from that date, it was not fully established until 1867.

In the 1870s the division within the NATIONAL SEC-

ULAR SOCIETY (NSS) affected the Leicester Secular Society. The conflict between the Bradlaughites (followers of Charles BRADLAUGH) and the dissenting group was partly personal, and partly a difference over strategy, whether to espouse forthright atheism or a more positive approach. The Leicester Secular Society supported the anti-Bradlaugh British Secular Union, and Gimson refused to let the Society's premises for NSS events. The division was healed by the end of the decade.

In 1869 the Society acquired premises with a reading room at 43 Humberstone Gate. (Reading was greatly important to nineteenth-century secularists.) In 1873 they moved to 77 Humberstone Gate with the hope of building a new hall. The Secular Hall Company was launched in 1872 with John Sladen of Sladen's Indigo Works as president, Josiah Gimson of Gimson's Engineering Works as treasurer, and W. H. Holyoak as secretary. The Secular Hall held its opening ceremony in 1881 with a lineup of luminaries in attendance that included Bradlaugh, George Jacob Holyoake, G. W. FOOTE, Charles WATTS, and Harriet LAW.

A renowned feature of the Hall was the sculptures decorating the front of the structure: busts of SOCRATES, VOLTAIRE, Thomas PAINE, Robert Owen, and—Jesus. Local Christians were outraged at the inclusion of Jesus in a secular pantheon, but the secularists considered that like the others, Jesus was a freethinker who had challenged the established religious orthodoxy of his day.

The Leicester Secular Society prospered better than most such groups in the latter part of the century. Their "positive" secularism compared favorably in the eyes of many with the purely negative atheism of the NSS. The hall was used for lectures, reading, a Sunday school, and social activities.

Two notables among the society's organizing secretaries were the former Franciscan Joseph MCCABE (1898), a famous FREETHOUGHT writer and lecturer, and F. J. Gould (1899), who was well known for his espousal of moral education, that is, to encourage and promote the idea and practice of moral behavior in schools.

The society continued with rather varied success during the twentieth century, but the centenary of the hall was feted in 1981 with the well-known Labour politician Michael Foot on the platform. Today most of the building is rented out to other users, but it is still owned by the Leicester Secular Society which continues its existence in a modest way.

JIM HERRICK

LENIN, VLADIMIR ILYICH (1870–1924), Russsian socialist revolutionary. Given the focus of the *New Encyclopedia of Unbelief*, this article will stress Lenin's positions regarding religion and to a much lesser extent his positions regarding empiricism and POSITIVISM. None of these makes Lenin an important historical figure; his importance lies is his role as a political and revolutionary leader. What Lenin had to say about religion and philosophy was always subservient to his political and revolutionary agenda, and takes what importance it has from that.

Vladimir Lenin was the principal figure in the development of MARXISM in the early twentieth century, the first and a deeply influential leader of the Soviet Union, and the architect and developer of the Bolshevik Revolution. Still, the struggle against religion and to develop and to propagate ATHEISM so that it would become an integral part of popular consciousness in Communist societies—eventually in a Communist world—and to develop as a first step an atheist society free of religion, was a key aim of both Lenin and the Soviet Union (see PROPAGANDA, ANTIRELIGIOUS [SOVIET]). As Lenin and most others understood it, Marxism is materialist (see MATERIALISM, PHILOSOPHICAL), and as such left no room for belief in God or belief in immortality.

Capitalist democracies display a commitment to the independence of state from religion. The state must be neutral vis-à-vis religion; our societies must remain pluralist, and there must be neither an insistent state religion (demanding strict adherence by all its citizens and/or forming the official agenda of the state) nor state antireligion. Religion, nonreligion, or irreligion are seen as a private matter exempt from state demand, a need for official authorization, or even expressions of state preference or orientation. Indeed, one of the key functions of the state, on standard liberal preconceptions, is to protect us from these things. Lenin's position was importantly different from this liberal ideal. It is important to understand that position and its rationale.

Formation of Lenin's Views on Religion. Lenin was brought up in a religious but unbigoted atmosphere. At age fifteen or sixteen he lost his faith; this occurred long before he had any contact with or knowledge of Marxism, and took a typical rationalistic, Enlightenment-based, and anticlerical form, much more in the tradition of Baron d'HOLBACH than Ludwig FEUERBACH (see RATIONALISM; ENLIGHTENMENT, UNBELIEF DURING THE; ANTICLERICALISM). He thought, and would continue to think throughout his life, that the development of science had made atheism obvious (see RELIGION IN CONFLICT WITH SCIENCE). For Lenin, the beliefs in God and immortality and their associated doctrines had been shown decisively to be illusions, and often dangerous illusions. A scientific education revealed that religion was little better than a nest of superstitions.

It was only later, after studying Karl MARX and Friedrich Engels, that he came to see something of the

extent of the class content of religion and the harmful social functions of religion. Lenin maintained that the very idea of God "has always lulled to sleep and dulled 'social sentiments' substituting dead for living things, always being an idea of slavery . . . [that] *tied down* the oppressed *classes* with a faith in 'the divine character of the oppressors.' The real content of the idea of God consists of 'filth, prejudices, sanctification of stupor. Religion was in the service of autocracy; churches were means of keeping the masses submissive and humble, an "ideological knot" used to keep the exploiters in power and the masses in a state of misery, on the one hand, and of serfdom and monarchy on the other.'"

This is strong stuff, but Lenin's hatred of and opposition to religion was very strong. He had no interest in inquiring into or discussing religion in order to see whether it has any justification or a raison d'être. That it had neither, he believed, except as an ideological instrument of suppression by the ruling classes, was so obvious that it was not worth discussing. The merits, or lack thereof, of religion were not something to be discussed; rather, our energies should be devoted to eradicating religion whenever and wherever possible. Any deviation from that aim was merely temporary and tactical. He was interested in ascertaining how and under what conditions religion could be brought to an end and be replaced by a thoroughly materialist and revolutionary outlook.

Lenin's interest in religion, to repeat, was tactical and political. He saw religion as an ideological weapon of the exploiting classes; what was required was to struggle effectively against it, not to prattle on concerning whether it could have any justification. Enlightenment philosophers and scientists had already conclusively established the case for atheism.

Lenin's Tactics toward Religion. We should distinguish three periods during which Lenin, always taking his tactical approach to religion, faced sharply different situations with regard to it. The first period was slightly before and around the revolution of 1905. During that period Lenin's tactical consideration of religion centered mainly on opportunities to expand political agitation. The second stage peaked around 1917, in the context of the second and successful Bolshevik Revolution. At this time, in his struggle with certain tendencies and factions within the revolutionary party, he set forth a Bolshevik program and tactics on religion. The third stage came when, as the leader of the newly formed Soviet Union, he was charged with leading its governance in very difficult circumstances. In the latter situation he was faced with a massively religiously orthodox population hostile to the aspirations of the Soviet Union. Against this background, he had to make policy for the new society in accordance with his (and the party's) antireligious social program: a social program for a thoroughly secular socialist society.

During the first phase Lenin stressed presenting the Orthodox Church as a servant of czarist aristocracy: an oppressor of the people, keeping them ignorant and superstitious, leading them into slavish obedience and subservience, and promising that if they obeyed church doctrine and the established order, they would in their "next life" be rewarded with a glorious heavenly kingdom and with perpetual bliss. The clergy—"gendarmes in cassocks"—perpetuated this heavenly swindle along with a host of other superstitions. The clergy aimed to keep the masses docile in their ignorance and fear. (The fear of hell was particularly driven into them.) Lenin lay stress on exposing these things, and in an anticlericalism that demanded complete separation of the church from the state and of the church from the schools, as well as freedom of conscience. Here he supported the cause of sectarian religious opposition to the established church, hoping to bring the sectarian faithful over to supporting the revolution.

During the second phase, which peaked in 1917 but began with the 1905 revolution, Lenin turned his attention to setting a Communist Party program toward religion. In his *Socialism and Religion*, written in 1905 and probably his most important general statement concerning religion, Lenin wrote:

> We demand that religion be regarded as a private matter in relations to the state, but under no circumstances can we consider religion to be a private matter with regard to our own party. The state must not concern itself with religion; religious societies must not be connected with the state power. Everyone should be absolutely free to profess whatever religion he prefers or to recognize no religion. . . . There must be no discrimination whatever in the rights of citizens on religious grounds. . . . No subsidies must be paid to the state church, and no state grants must be made to ecclesiastical and religious societies, which must be absolutely free, voluntary associations of like-minded citizens independent of the state. . . . As for the party of the socialist proletariat, religion is not a private matter. Our party is a league of conscious, leading fighters for the liberation of the working class. Such a league cannot and must not be indifferent to lack of consciousness, ignorance or obscurantism in the shape of religious beliefs. We demand a complete separation of church from state in order to fight against religious fog with purely ideological and only with ideological weapons—our press, our word. We created our league, the RSDWP [Russian Social Democratic Workers Party], among other things, precisely for such a struggle against all kinds of religious deception of the workers.

However, Lenin quickly qualified his stern stance by remarking that the party should not forbid the admission of believers who are committed to the proletarian revolution and to socialism. With a good tactical sense, he

remarked that the enemies of socialism would like to split the socialist movement by playing off its believers against its atheists. The party should for the time being tone down its antireligious propaganda (discursive agitation and indoctrination). As far as its platform was concerned, the party should remain firmly atheistic, but would not strike committed comrades from its ranks because of their religion. Lenin's hope and belief was that by participating in the class struggle, believing comrades would come to see the reactionary, obfuscating, and thoroughly instrumental role religion plays in supporting and furthering the interests of capitalism.

Lenin is again tactical here. He is "softening" neither his atheism nor his belief in the need for a Marxist socialism to display explicit atheism and a firm antireligious orientation. This can be clearly seen by his intense negative reaction to the so-called god builders, a faction of party intellectuals that included Anatoly V. Lunacharsky and Maxim Gorky. Lenin did not call for their expulsion from the party, but his criticism of their position was unqualifiedly hostile. The god builders argued for a humanist religion without God or any other "spookish" substitutes. They called for a completely secularized religion of humanity in the tradition of Auguste COMTE and Feuerbach, a religion of humanity and of love and respect for the "new proletarian man" who would come slowly into existence with the struggle for and finally the achievement of socialism.

One might have thought Lenin would have been mildly amused by the prospect of attaching such harmless decorations to the cause. Instead he reacted explosively. He saw god building as a subtle bit of illusory irrealism and antimaterialism, dangerous because in effect, though not in intent, it served as propaganda to revive religion among the masses. For Lenin, it was all the more dangerous because it was cleverly disguised, though not by conscious subterfuge on the part of the god builders. He recognized that they were not aware of the ideological content of what they were setting forth. The god builders saw their program as a sanitized method by which a Communist should bring enlightenment to workers and peasants. Lenin believed it would have an entirely different effect. The problem with a refined secular religion without God, as Lenin saw it—again in tactical terms—was that (as he wrote to Gorky):

> The crowd is much more able to see through a million *physical* sins, dirty tricks, violences and *physical* infections which are therefore much less dangerous than is the *subtle* spiritual idea of dear little god [*bozhen'ka*] arrayed in the smartest of ideological costumes. A Catholic priest who violates young girls (about whom I happened to read just now in a German newspaper) is *much less* dangerous . . . than are priests who do not wear cassocks, priests without vulgar religion, ideological and democratic priests who preach the creation and making of dear little gods. . . .
>
> There was a time in history when . . . the struggle of democracy and the proletariat took the form of the struggle of *one religious* idea against the other. But this time had passed long ago. Now, both in Europe and in Russia, *every*, even the most refined, most well-intentioned, defence or justification of the idea of god is a justification of reaction.
>
> Both "god-building" and "god-seeking" are essentially one and the same exercise in "ideological necrophilia." Regardless of the subjective intentions of their advocates, *objectively*, under the present relationship of class forces, they help to adorn and sweeten the political and economic oppression of the people.

According to Lenin, the party must oppose all forms of religion and religious consciousness, both Russian Orthodoxy and a Feuerbachian religion of humanity, with the firmly materialist and scientific worldview of the Marxism of Marx and Engels.

From where we stand now, this sounds more like Marxist fundamentalism, like a Communist church, than a scientific orientation. Moreover, there is little evidence that such humanistic religious talk ever seduced the masses. Where the masses noticed it at all, if they did, it would surely have seemed to them a perversion of their faith and of all the promises that religion held out for them. Atheism and Marxism had nothing to fear from those god builders. This dispute was purely an exercise in point-counterpoint among the chattering classes, with little ideological or practical effect.

The third phase of Lenin's treatment of religion began after the successful Bolshevik Revolution. It centered around the problem of leading the newly emergent Soviet Union in the face of an implacable and openly hostile Russian Orthodox Church, which had soaked the masses of the peasantry in the crudest form of religion. It was one thing to claim that the state must be religiously neutral while the party must not when the Bolsheviks were not in power—but it was quite another thing when the Bolsheviks were in power, when they, with their atheistic commitments and atheistic worldview, governed, and in some functional sense *were*, the state. In such a situation, how could the party's nonneutrality toward religion fit with state neutrality toward religion? It did not and could not.

By decree, the Bolshevik vanguard party nationalized all ecclesiastical and monastic lands, separating the church from the state and schools from the church. The church was no longer a juridical person and had no right to own property. This in effect made the church dependent on the state. It was also the case that antireligious propaganda was intensified. Freedom of conscience came in effect to mean freedom from "religious opium"; private religious instruction was forbidden for people under the age of eighteen; most monastic institutions were disbanded; the Soviet Commissariat of Justice

carried out a campaign of opening Orthodox religious relics to expose religious frauds; churches were deprived by government decree of all facilities for the training of clergy or the publication of religious literature.

Lenin remained zealously committed. He even wrote a new section for the party program adopted at the Eighth Congress in 1919 and reaffirmed in 1923 by the Comintern's executive committee, and declared obligatory for all its member parties. In this section Lenin wrote: "The party strives for the complete dissolution of the ties between the exploiting classes and the organization of religious propaganda, as well as for the real emancipation of the toiling masses from religious prejudices; to this end, the party organizes the widest possible scientific, educational and anti-religious propaganda."

Immediately afterward Lenin, always the astute tactician, added, "At the same time it is necessary carefully to avoid giving offence to the religious sentiments of believers as that only leads to that strengthening of religious fanaticism."

Lenin believed he must engage in the strategies and tactics necessary for the achievement and consolidation of socialism. With this aim in mind, Lenin pressed relentlessly for action on the antireligious front. But he still remained carefully tactical. In his last public statement concerning religion, "On the Significance of Militant Materialism" (1922), he acknowledged the need for flexibility as well as moderation in carrying a long-range approach to atheistic indoctrination. He recognized that this was often ignored in the practices of the party cadres, and he called for more intelligent defenses of atheism. In this, cadres should take instruction from the eighteenth-century materialists.

Despite his conviction that tactics should change with context, from the age of sixteen until the end of his life Lenin maintained his Enlightenment trust that science and reason would bring liberation from the mystifications and illusions of religion. Like Lenin himself, the party, even in the governing of the state, "could not be philosophically neutral: it was materialistic, therefore atheistic and anti-clerical, and this world-outlook could not be a matter of political indifference." What was needed, he thought, was a committed government led by a vanguard party for an atheist state.

Leninism, Justice, and Unbelief. Many secular humanists (including many who are firm atheists) are first shocked by Lenin, and then, on reflection, led to reject much of Lenin's stance concerning religion. Even some of those who are firm socialists as well as atheists are reluctant to embrace a view that commits socialism, even a Marxist socialism, to a militant atheism in matters of governing policy. They are reluctant, that is, to commit socialism to atheism (militant or nonmilitant) as a matter of state or even party policy. They have no wish to be the mirror image of the Vatican nation-state. To them, religious belief or unbelief should be purely a matter of private conviction. (Lenin, of course, would view this as liberal shilly-shallying.) They recognize that there exist committed socialists (Simone Weil and David McLellan, for example) who also are firm religious believers—as attuned to the pervasive ills and ugliness of religion as socialist atheists, yet holding religious beliefs and commitments that form a central part of their lives and about which they have thought deeply.

Some socialist atheists (though not necessarily for the same reasons) may be as convinced as Lenin was of the unjustifiability, unreasonableness, and even the irrationality of religious belief. Some are as convinced as he that there is no God. Indeed some even think there *can* be no God as God has come to be construed in medieval and modern Judeo-Christian-Islamic tradition. But they will also recognize (as Lenin *seems* not to) that there exist some religious believers, even believers in the more orthodox conceptions of religion, who think otherwise—and that some of these are reasonable and informed persons, as intelligent as any atheist, and possessing as much integrity and thoughtfulness as even the most reflective atheists. Here, such atheists will feel to the full what John Rawls calls the burdens of judgment. Further, they recognize that in a pluralist society (indeed, a pluralist world), many divergent conceptions of the good life and many different worldviews are arguably reasonably held. The social glue that binds us, at least in modern societies—a thin though not insignificant adhesive—is a common family of general conceptions of social justice consistent with what Rawls would term a reasonable pluralism. Only the recognition and acceptance of these conceptions makes living together tolerable. In short, these atheists have bought into the Jeffersonian-Rawlsian compromise, and recognize as well that in the very weak (but practically acceptable) Rawlsian sense that some of these reasonable pluralisms are religious ones. Moreover, standing in back of this is a principle that is less normative, more of a modus vivendi. It is rooted (wittingly or unwittingly) in a recognition of the importance of the Treaty of Westphalia, which brought an end to Europe's religious wars. It is a pragmatic recognition, available to all who are not fanatics, that religious wars or deep religious civil strife are to be avoided, including wars or civil strife between belief and unbelief. And this conviction may remain, no matter how unreasonable, fantastic, and frequently ideological they may take religions, religious doctrines, and religious belief and practices to be. Such convictions incline atheists of this flavor to an almost knee-jerk rejection of Lenin's stance on religion.

I too (though with some ambivalence) accept that Jeffersonian-Rawlsian compromise, particularly in its Rawlsian form. Moreover, I believe that we need something like the peace of Westphalia both between one religious belief and another, and between religious belief and unbelief. Most of the decrees and practices concerning religion carried out by the Soviet Union under Lenin's leadership were far too draconian, offering a

mirror image of the tendencies we deplore in the Vatican and reflecting a similar mind set.

However, in his general program for secular commitment on the part of a socialist party and its cadres, Lenin was committed to achieving class emancipation, and (with classlessness secured) to moving beyond that toward a general human emancipation. This, he thought, would require a secularist turn. It is not so clear to me that Lenin was wrong over such basics; it is not clear to me that we should instead embrace the Jeffersonian-Rawlsian compromise and insist on state neutrality concerning religion. To be sure, the state should remain neutral toward *liberal* religions, all of which are compatible with both socialism and a reasonable pluralism. In contrast to the liberal religions, the great orthodox faiths, including those Lenin set his face against—the Roman Catholic Church, Russian Orthodoxy, Calvinism, Orthodox Judaism, Orthodox Islam, and the various fundamentalist Jewish, Christian, and Islamic doctrinal stances—engage in practices that severely harm millions of people, causing grave injustices to women and children, to the lower classes, and sometimes to anyone whose religious or nonreligious orientation differs from their own. These orthodox creeds frequently breed hatred, intolerance, and repression. These are severe injustices in the very terms of the conception of justice that Rawls articulates. It is understandable that Lenin was so exercised about religion. *These* religious beliefs and belief systems are (to put it mildly) not compatible with a Rawlsian reasonable pluralism. To the extent that liberals and socialists tolerate them, it is *only* for modus vivendi reasons—for example, they will crush us if we don't; firmly opposing them will set in motion once again the horrors of religious wars; or we have no overlapping consensus from which we might develop a successful practical action program.

Given considerations such as these, we secularists (socialist and nonsocialist), if we are reasonable, will slog on through the slow processes of sober reasoning together with religious people, all the while hoping that increasing and more equally distributed wealth, increasing democracy, and increasing education (say, on the model of contemporary Scandinavian societies) will gradually lead them out of the religious and moral wilderness of their beliefs. Still, some of the most powerful of these religions (though not all of them to the same extent, nor over the same things) give rise to terrific injustices. Intransigent Catholic policy on the use of condoms condemns millions of very young children to parentless lives in poverty and neglect. Islamic sharia law and Orthodox Jewish law on divorce allow men to brutally dominate women. Many orthodox traditions exclude—and sometimes, as when the Taliban held power in Afghanistan, even murder—homosexuals. Many allow extreme wealth to accrue to religious hierarchs while the poor starve, or seek to undermine women's knowledge of and access to abortion and even contraception. The injustices surge on owing to the commitment of these religions to obscurantist, utterly unjustifiable beliefs, and to their propagation and protection by a religious aristocracy. Faced with injustices as great as these, and recognizing their intractability, must we think Lenin so wrong in his militant atheism—so far afield in his demand that atheism form part of the platform of a political party devoted to the good of human beings? There is sense, even wisdom, in the Jeffersonian-Rawlsian compromise. But I think the question about Lenin's wrongness needs a sober second reconsideration.

KAI NIELSEN

LENNSTRAND, VICTOR EMANUEL (1861–1895), Swedish teacher, lecturer, and publicist. Founder of the Utilistiska Samfundet (Utilitarian Society) in 1888, the first and only Swedish atheist organization at the time, numbering two thousand members (see SWEDEN, UNBELIEF IN), Victor Emanuel Lennstrand edited two periodical publications between 1890 and 1894, *Tänk Sjelv!* (Think for Yourself!) and *Fritänkaren* (Freethinker), the latter of which attained a circulation of thirty-five hundred copies. Elected a member of Sweden's first Convention for Popular Vote, Lennstrand delivered speeches in front of thousands of people and started a massive movement against the church and religion. He translated works by Robert Green INGERSOLL, Charles BRADLAUGH, John Stuart MILL, and others. In addition he published many of his own essays and lectures: "What We Believe and What We Want" (1888), "Jehovah Is Dead," "The Republic, the Popular Vote

and Freethinking" (1891), "What I Said and What I Did Not Say" (c. 1890), and others.

Born in a family with strong Christian beliefs, at the age of twenty Lennstrand entered Upsala University to study theology. In 1883 he published a selection of sentences and maxims favoring the Christian religion. Ingve Sahlin, professor at Upsala University, convinced him to read John LOCKE, Mill, Auguste COMTE and others. Once acquainted with rationalist literature, Lennstrand's clear and penetrating mind led him to abandon his parents' faith. On September 27, 1887, he gave a lecture titled "Is Christianity a Religion for Our Time?" that marked the beginning of his battle against church, religion, and monarchy, and exasperated Upsala's police chief.

Between 1888 and 1893 Lennstrand was prosecuted seven times, condemned four, and imprisoned for fourteen months in squalid conditions. He was forced to leave the university and became an outcast to his family. Nevertheless, he devoted his short life to the ideal of utilitarianism, which he called Utilism—the doctrine of the English philosophers Jeremy BENTHAM and Mill that consists in the attainment of the highest amount of happiness or profit for humanity as the moral purpose, the establishing of human reason as the only judge in moral questions and the rejecting of the existence of God (see CONSEQUENTIALISM).

Lennstrand kept in contact with the principal representatives of nonbelief of the late nineteenth century, including freethinkers of France, Germany, Belgium, and Spain. In 1892 he promoted a motion addressed to the Swedish Parliament abolishing Sweden's BLASPHEMY law, but it came to nothing. He was invited to the International Congress of Freethinkers, held in Chicago in 1893 and sponsored by the Unitarians of the United States. He was compelled to postpone and ultimately cancel the trip due to his deteriorating health.

In December 1894 he was forced to give up all his activities due to a painful, mysteriously contracted illness that provoked his death on November 1, 1895. The disease—"possibly tuberculosis," wrote one of his friends—was never clearly identified.

JOSÉ MANUEL FERNÁNDEZ SANTANA

LESSING, GOTTHOLD EPHRAIM (1729–1781), German dramatist and critic. The son of a scholarly Lutheran pastor, Gotthold Ephraim Lessing was sent to study theology at Leipzig University. There he was influenced by the popular RATIONALISM of the Enlightenment (see ENLIGHTENMENT, UNBELIEF DURING THE), whose leading contemporary exponent was Christian Wolff. Lessing was influenced in the same direction by friends from Berlin, Friedrich Nicolai and Moses Mendelssohn, and by various writings of English deists (see DEISM), many of which had been translated into German. Although literature and especially drama became Lessing's supreme interest, he was to return to theology in the last decade of his life.

Lessing was above all a critic of literature. His nonconformity made him appear perennially restless. He was never permanently satisfied to adopt the conventional opinions of society, always preferring to be in a "minority of one." He moved beyond his parents' theological beliefs and the commonplace deism of his youth until he, influenced by Baruch SPINOZA, prepared the way for the romantic reaction against the Enlightenment.

Lessing's best-known work of criticism is his *Laokoon* (1766), a study of art, paintings, and poetry. Lessing's writings on art and literature do not constitute a serious analysis and critique of aesthetic experience, but aim at liberating the artist from limiting rules and conventions. Lessing was not a romantic writer, but because of his demand for the free expression of natural feelings and his interest in antiquity, he occupies an important place among the forces that made German romanticism possible.

In 1773 Lessing began to publish essays on historical theology. Lessing had met the deist Hermann Samuel Reimarus, whose daughter lent him the manuscript of an unpublished book by her father, *Apology for Rational Worshippers of God*. In 1774 and in 1777–78, Lessing printed extracts from this work as fragments of the writings of an anonymous deist. Reimarus was a believer in natural religion and skeptical about revelation. His objections to traditional Christianity presuppose that biblical inerrancy is essential to faith (see BIBLICAL ERRANCY). Lessing sometimes wrote as if he shared this assumption, and sometimes as if he did not.

Prevented by his superior from indulging in theological controversies, Lessing put his theology into a play, *Nathan the Wise* (1779). It has been read as a plea for religious indifference, on the ground that what is required of man is not an assent to the propositions of a creed but sincerity, brotherly love, and tolerance. It is not known precisely what Lessing's positive beliefs were, but he probably accepted a common thesis of the Enlightenment that the essence of Christianity, hidden beneath the accretions of theology, consists in universal brotherhood and a basic moral code. Henry Chadwick has said that "Lessing spent his life hoping that Christianity was true and arguing that it was not. But his basic

attitude toward religious belief was neither one of affirmation nor of denial; it took the form of an impassioned question."

FINNGEIR HIORTH

LESUEUR, MERIDEL (1900–1996), American author and radical. From her origins in Murray, Iowa, at the dawning of the twentieth century, Meridel LeSueur was shaped by and intimately connected to the rural Midwest throughout her long and productive life. Her mother, Marian, graduated from Drake University, where she showed intellectual promise, but was unhappily married to a preacher. The young family moved to Texas, but Marian escaped with her children to Oklahoma, where the laws were fairer to women in such circumstances. At the People's College in Fort Scott, Kansas, Marian became a teacher, and she is credited by some with the original idea of the Little Blue Books so successfully developed by Emanuel HALDEMAN-JULIUS. At the college she met and married Arthur LeSueur, the head of the law school, beginning a long and fruitful alliance in radical causes of all kinds.

Meridel LeSueur had left high school before graduating, and went on to Chicago and then to New York, where she lived in Emma GOLDMAN's anarchist commune. This Bohemian milieu of free spirits nurtured LeSueur's rebellious and lyrical tendencies, and soon she began writing of her experiences and feelings in notebooks. Inspired by the general atmosphere of radicalism, LeSueur joined the Communist Party in 1924. She began her formal writing with a story, "Annunciation," in 1927. She witnessed the dramatic Teamster's strike in Milwaukee in 1934, and described it in "I Was Marching," published in the proletarian magazine *New Masses*.

She participated in the American Writers Congress of 1935 and contributed a short essay to the volume of its proceedings, emphasizing the continuity of the midwestern radicals with the earlier Industrial Workers of the World, a group not exactly in favor with the Communist Party at that time. A first volume of stories, *Salute to Spring*, was issued in 1940. During a period of catastrophic social, economic, and environmental upheaval, LeSueur lamented "the dreary villages, the frail wooden houses, the prairies ravished, everything impermanent as if it were not meant to last the span of one man's life, a husk through which human life poured." This volume, along with LeSueur's avowedly revolutionary politics, confirmed her place as a brave yet lyrical literary voice.

During the early 1940s LeSueur worked on *North Star Country*, a folk history of the upper Midwest. Published in 1945, its success was blunted by LeSueur's blacklisting during the McCarthy repression. While she continued to publish a few children's books through the publisher Knopf, for the most part she was driven out of mainstream publishing. Indeed, she could not even keep a menial job such as waitressing without being harassed by the FBI. In spite of this she managed to travel the country, preserving on tape the life histories of veteran radicals. She also wrote stories about the impact of the blacklist and Korean War on grassroots American people.

With the rise of the modern feminist movement in the mid-1970s, LeSueur was "rediscovered," though she protested, "I never was lost." West End Press began to collect her stories from obscure left-wing magazines, and in 1977 issued two small but richly textured volumes, *Harvest* and *Song for My Time*. The next year, West End published a short novel, *The Girl*, a chronicle of the Great Depression LeSueur started in the 1930s but later reworked and expanded. *Ripening*, a volume of selected works, appeared in 1982.

LeSueur's maternal grandmother was a devout member of the Disciples of Christ in Oklahoma, and some ethical aspects of popular Christianity appealed to her. Even so, LeSueur became a resolute foe of Puritanism in all its forms, viewing it as a profound capitalist threat to "the body" and to humanity. And while she was friendly to FREETHOUGHT, she also counseled "not to forget the Tao of physics," as, she believed, earlier societies had contributed much of value to our store of culture. LeSueur's personal library is now at Augsburg College in Minneapolis, and her notebooks are in the collections of the Minnesota Historical Society.

FRED WHITEHEAD

LEUBA, JAMES H. (1868–1946), American psychologist. James H. Leuba was born in Neuchatel, Switzerland, where early skeptical reaction to Calvinist doctrine and behavior prompted a lifelong interest in understanding religious experience. After receiving a bachelor's degree from the University of Neuchatel, Leuba moved with his family to the United States. He earned a doctorate in psychology at Clark University under G. Stanley Hall, with a dissertation on the psychology of religious conversion. He spent his entire academic career as professor and, for a time, chairman of the department of psychology at Bryn Mawr College.

Body of Work. Leuba's approach to the study of religious experience was resolutely naturalistic and empirical, carefully reasoned and forthright. This earned him intermittent critical reactions from religious colleagues and apologists throughout his career. While his lasting reputation rests upon seminal studies of beliefs in a personal God and immortality in the United States, the balance of his work deserves equal, if not greater, attention. In *The Psychological Origin and the Nature of Religion* (1909) and *A Psychological Study of Religion* (1912), Leuba sounds several themes that frame his lifelong view of religious experience. To maintain clarity about the subject, religion is delimited to "that part of human experience in which man feels himself in relation with powers" of a "psychic," divine, or supernatural nature. He rejected the utility of definitions of "religion" that encompass "anything that is of considerable value to man." Religious experience is viewed as a complex, natural, functional, and in certain forms dysfunctional means of meeting basic human needs. Leuba was critical of attempts to reduce religion to a single dimension. In its internal aspect, religion involves "willing, feeling, and thinking" aimed at the gratification of human "needs, desires, and yearnings." In its external aspect, it involves practices, rites, ceremonies, and institutions.

Leuba vigorously combated the view that, due to its claimed supernatural content, religious experience falls outside the purview of science. He insisted that since religious consciousness is a psychological process, it is accessible to empirical inquiry: "*[T]he gods of religion are inductions from experience*, and are therefore proper objects of science." Leuba could not be persuaded "that divine personal beings . . . have more than a subjective existence." At the same time, religion arose from natural psychological processes to meet human needs. It should be "looked upon as a functional part of life, as that mode of behavior in the struggle for life in which use is made of powers characterized . . . as psychic, superhuman, and usually personal."

Leuba offers compelling, if speculative, accounts of the likely origins of religious beliefs. Ideas of ghosts, nature-beings, and gods emerge from a wide range of psychological processes, including altered states of consciousness (such as trances, dreams, apparitions, and hallucinations), prescientific perceptions of striking natural phenomena, and the human penchant for attributing purposive agency to "explain" natural events. Throughout his work, Leuba was critical of religious ideas at odds with scientific knowledge and moral progress. In this connection, he was consistently critical of selected aspects of Christian monotheism (such as a personal relationship with God). The closing chapter of *The Belief in God and Immortality: A Psychological, Anthropological, and Statistical Study* (1916) is an eloquent essay on the independence of moral knowledge from religious belief and the threats to moral progress posed by certain religious forms (see ETHICS AND UNBELIEF).

In *The Belief in God and Immortality*, Leuba reported on the first of his statistical surveys of (un)belief in a personal God and immortality among American scientists, historians, college students, and others (see SCIENCE, UNBELIEF WITHIN). Thanks in part to a general replication of his surveys of scientists in the 1990s by Edward J. Larson and Larry Witham, Leuba's findings remain in the public eye. He found, for example, that fewer scientists overall were believers than "doubters" or "disbelievers" in a personal God (42 percent in 1914, declining to 30 percent in a subsequent survey in 1933). Belief in immortality was slightly more prevalent, but also showed a decline from 49 percent in 1914 to 33 percent in 1933. Also, believers in both a personal God and immortality were substantially rarer among "elite" compared with "lesser" scientists, and among social scientists compared with physical or biological scientists.

In *The Psychology of Religious Mysticism* (1925), Leuba provided an extensive and detailed analysis of the varied forms, causes, and perennial allure of altered and ecstatic states (see RELIGIOUS AND MYSTICAL EXPERIENCES). Drawing from extensive historical source materials, his unflinching naturalistic analysis drew critical reaction. His view that associations of God or the divine with the "immediate" content of mystical experience result from post hoc cognition, rather than direct "knowledge" of such realities, contrasted with William James's greater propensity to allow that the apparent immediacy of such associations may offer evidence of their referent truth. The fact that Leuba's work has remained obscured in the shadow of James's "The Will to Believe" and *The Varieties of Religious Experience* is noteworthy and regrettable.

In *God or Man? A Study of the Value of God to Man* (1933) and *The Reformation of the Churches* (1950; published posthumously), Leuba recapitulated his main themes and looked to the future of religion, human needs, and moral progress. Throughout his career, he held that religious ideas and forms at odds with scientific knowledge or moral progress would gradually be supplanted (the secularization hypothesis). Rather than a complete eclipse of religious by scientific or secular worldviews, Leuba foresaw forms of experience and behavior that preserve some of the functional benefits of religion in harmony with scientific knowledge. He repeatedly cited Felix ADLER's ETHICAL CULTURE as one possible model for such future "religion"—retaining a sense of the "spiritual," a natural and consequence-based moral approach, and due regard for scientific inquiry and knowledge. He spoke hopefully about the early promise of philosophical HUMANISM. However, he held "no expectation . . . of a rapid transformation of all the churches," noting that "fundamentalist churches are far from having been outgrown by all the people," a "religious rear guard will remain with us for a long while," and that "intellectual and moral progress is distressingly

slow." The whole of Leuba's body of work and its central messages deserve renewed attention and reappraisal.

FRANK L. PASQUALE

LEWIS, DAVID (1941–2001), American atheist philosopher. A professor at Princeton University for most of this academic career, David Lewis was a towering figure in philosophy in the second half of the twentieth century. He made important and original contributions to a wide range of philosophical fields, including metaphysics, epistemology, philosophy of mind, philosophy of language, philosophical logic, ethics, political philosophy, and philosophy of religion.

Lewis was born into a nonreligious household and initially seemed destined for a career in chemistry. When he reverted to philosophy, he brought with him a firm attachment to both atheism and reductive materialism (see NATURALISM; MATERIALISM, PHILOSOPHICAL). He played a central role in the development of contemporary materialistic philosophies of mind, where he defended a version of the doctrine that mental states are merely certain kinds of states of the brain and central nervous system (see COGNITIVE SCIENCE AND UNBELIEF). More generally, he defended the view that there is a sense in which everything is physical: at least roughly speaking, he held that there are no objects or properties that are not ultimately, in principle, analyzable in terms of microphysical objects and microphysical properties (see PHYSICALISM).

Lewis's ATHEISM is visible in much of his writing. His analysis of ontological arguments in "Anselm and Actuality" (1970) is one of the most penetrating articles on that topic. His take on problems of evil and, in particular, on free-will theodicies in "Evil for Freedom's Sake?" (1993) is subtle and persuasive. His discussion of the Christian doctrine of atonement in "Do We Believe in Penal Substitution?" (1997) is an interesting addition to a small literature.

Lewis is perhaps most notorious for his "modal realism," that is, for his view that all possible worlds exist, though no other possible world has any connection to our own space and time. On Lewis's view, there are talking donkeys, even though there are no talking donkeys in the part of reality that we inhabit. Lewis's modal realism led him to the view that there are both gods and unembodied minds—but only in possible worlds other than the one that we actually inhabit. Setting aside Lewis's modal realism, this means that he accepted that the existence of gods and unembodied minds are unrealized logical possibilities. While Lewis's rejection of the claim that it is logically necessary that there are no gods and no unembodied minds finds widespread support, there are many atheists and materialists who prefer to disagree with Lewis on this matter.

GRAHAM OPPY

LEWIS, JOSEPH (1889–1968), American atheist activist. Joseph Lewis was arguably one of the two most prominent atheists in the United States during the first half of the twentieth century, the other being Emannuel HALDEMAN-JULIUS; however, Lewis never achieved the recognition in the international freethought movement that he deserved. Lewis was born into a Jewish family in Montgomery, Alabama, the youngest son of Samuel and Ray Lewis. In 1898, strained financial circumstances forced him to leave school to seek employment. He continued his education by reading avariciously in his lim-

ited spare time, later describing himself as self-educated. In the course of his reading, he encountered a work by Robert Green INGERSOLL that drew his attention to Thomas PAINE's *Age of Reason*, and this, he told a meeting of the Thomas Paine Society in London in 1964, was instrumental in converting him to atheism.

On May 12, 1914, Lewis married Fay Jacobs. There were two children: a son born in 1916, who died in the influenza epidemic of 1920, and a daughter born in 1916. His first wife predeceased him, and in 1952 he married Ruth Stoller Grubman. No children resulted from this second marriage.

In 1920 Lewis moved to New York, where he established a mail-order clothing business. His unbelief led him into contact with the Freethinkers of America, founded in 1915. In 1925 Lewis arranged for its legal incorporation and was elected as its president. He held that office for the rest of his life, at times, it has been claimed, using underhanded methods to retain the post. Very much an individual, Lewis demanded his own way and resented any opposition, which on one occasion led to several distinguished honorary vice presidents resigning in protest. His control of the Freethinkers was strengthened because he personally met its annual deficit; it became in effect his private fiefdom. He used its journal, first published in January 1937 as the *Bulletin of the Freethinkers of America*, later as *Freethinker*, and finally as *The Age of Reason*, primarily to publicize his ideas and promote his various campaigns. The journal, like the Freethinkers, was never a financial success and was, according to his close friend William J. Fielding, Lewis's "hobby," though he qualified this by adding, "if it may be said he had one."

Lewis was able to subsidize the Freethinkers of America from the considerable profits he made from two publishing firms he established. The first was the Freethought Press Association, which he set up in 1921 to publish his first book, *The Tyranny of God* (1921). His policy was to sell books at low prices through the mail, and his advertising usually prominently displayed his own portrait. He was the author of several other freethought works, notably *The Bible Unmasked* (1926), thought by many to be his best work. He also printed the texts of several of his freethought lectures under the title *Atheism and Other Addresses*, which first appeared in 1930 and was subsequently updated and added to during the course of its several editions. The book he considered his finest atheist propagandist work was a massive treatise called *The Ten Commandments* (1946). His most courageous work was *An Atheist Manifesto*, published in 1954 at the height of the Cold War, when US public opinion viewed atheism as un-American.

Lewis's second publishing concern was the Eugenics Publishing Company, set up in 1930 and unquestionably his most profitable business venture. Lewis used the same methods he employed in freethought publishing, offering low-priced editions by mail covering birth control and related themes. He marketed his books to the general public rather than the medical profession.

From an early date, Lewis initiated a series of lawsuits to curb what he saw as the attempts by religious groups to circumvent the United States' constitutional separation of church and state.

As a consequence of his publishing activities, Lewis became a wealthy man, living in some comfort on a large estate in Westchester County, New York. He also owned a house in Miami Beach, Florida, where he usually spent the winter months, and an apartment on Park Avenue in Manhattan. According to Fielding, he enjoyed the company of "libertarians, iconoclasts, and exponents of various unorthodox philosophies." He corresponded with and entertained many leading figures in the worlds of art, science, and literature. He became a life member of American Association for the Advancement of Science.

Lewis lionized freethought icons such as Paine and Robert Green Ingersoll, and he sought to promote interest in them and defend their reputations against critics. He established two private organizations, the Robert G. Ingersoll Memorial Association and the Thomas Paine Foundation. In 1954 he succeeded in restoring Ingersoll's birthplace at Dresden, New York, for the second time and having it officially recognized as a public memorial (see MONUMENTS TO UNBELIEF). Lewis also raised substantial sums to erect statues of Paine in Paris; Morristown, New Jersey; and Thetford, England, Paine's birthplace. His lengthy agitation for a US postage stamp to commemorate Paine ultimately succeeded, although he stormed out of its unveiling ceremony at Philadelphia in January 1968 in protest because prayers were said. In addition, Lewis had a bust of Paine placed in New York University's Hall of Fame, though he failed to win Ingersoll a place there. Lewis also authored several short works on people such as Thomas JEFFERSON, George Washington, and Benjamin Franklin, in which he stressed their unorthodox religious opinions.

Convinced that Paine was the real author of the Declaration of Independence, Lewis presented his arguments in his book *Thomas Paine, Author of the Declaration of Independence* (1947). Although this work has been described as more polemical than historically convincing, some of the facts noted by Lewis would suggest that Paine had some input into the famous document.

Lewis died in New York on November 4, 1968. Attempts to continue the Freethinkers of America failed. It had become too much an extension of Lewis himself; moreover, his antagonism to any perceived threat to his leadership had ensured that there was no one in a position to take over effectively.

ROBERT W. MORRELL

LEWIS, SINCLAIR (1885–1951), American novelist. From obscure origins in the small town of Sauk Center, Minnesota, Sinclair Lewis rocketed to fame in the 1920s as the author of a series of satirical novels about Puritanism, power, and corruption in American life. The son of a physician and a mother who died of tuberculosis at a young age, Lewis had a difficult childhood and youth. Tall, gangly, and red-headed, he was not popular because of his eccentricities, among them a pronounced love of reading. While taking college preparatory courses at Oberlin, he was converted to Christianity, but soon began to have doubts. At Yale, he grew skeptical of the conservative secret-society culture that prevailed there. Eventually he gravitated to magazine writing in New York City, which enabled him to develop his craft but confirmed his dour view of commercialism.

His novel *Main Street*, published in 1920, is a pungent portrait of a remote Minnesota town called Gopher Prairie, obviously modeled after Sauk Center. It was largely autobiographical. The main character, Carol Kennicott, "an uneasy and dodging agnostic," finds fitting in to local society deadening, with its dull routine of gossip and oblivion concerning any form of modern or progressive culture. In spite of its biting satire (never a very popular art form in America), *Main Street* sold very well. It represented one of the most eloquent documents in what came to be known as the "Revolt from the Village," a literary trend to attack and expose the Puritanism and intellectual narrowness of rural life.

Even among those disposed to dislike Lewis's critical stance, his skill in language and realistic detail was widely applauded. In quick succession, he exposed the small businessman in *Babbitt* (1922) and medical research in *Arrowsmith* (1925). Then, in 1926, Lewis turned to the subject of religion, just at the time of the Scopes trial in Tennessee (see DARROW, CLARENCE; EVOLUTION AND UNBELIEF). He journeyed to Kansas City, where he took a hotel room and gathered ministers around him who were curiously eager to share their views and experiences, both virtuous and scandalous. While there, Lewis took a turn at a church pulpit, daring God to strike him down, if he existed. When the allotted minutes passed and Lewis still lived, his stunt made headlines across the country. *Elmer Gantry*, the novel resulting from his Kansas City research, caused a sensation upon its publication in 1927. Lewis described the novel as "a blast of protest against all organized religion. It is blasphemous, it is in bad taste, it is violent, it is—however humorous it may be in its minor details—in essence unhumorous; it is simply a roar of protest."

Paradoxically, Lewis's success as an outspoken critic of trends in American culture introduced him to high life. He fully participated in the excesses of the Roaring Twenties, becoming, like F. Scott Fitzgerald, an alcoholic of epic proportions. He frequently had to go into hospitals and clinics to "dry out." After refusing the Pulitzer Prize in 1927 on the grounds it was under the control of conservatives on the board of trustees at Columbia University, he accepted the Nobel Prize for Literature in 1930.

As a longtime rebel, Lewis supported labor unions, and was a good friend of the prominent socialist Eugene Debs. In the 1930s Lewis tried to write a novel about labor leader Debs, but abandoned the effort. *It Can't Happen Here*, published in 1935, was an exposé of fascist trends in America, but Lewis had difficulties relating to the various forms of Marxist rhetoric and organizations that arose during that period.

By the late 1940s Lewis was spending most of his time in Europe. Always restless, he traveled almost aimlessly from place to place. He continued to write and to publish novels, but with much less success than he enjoyed in the 1920s. Suffering from advanced alcoholism, he died in a Rome clinic, almost alone. His ashes were returned to Sauk Center for burial; he specified in his will that there be no religious ceremony.

FRED WHITEHEAD

LIBERAL, MISSOURI. The short-lived experiment of a churchless town in the Bible Belt of southwestern Missouri, Liberal was the brainchild of George Henry Walser, a poet, Civil War veteran, and lawyer who had moved to Lamar in Barton County, Missouri, in 1866 and established a successful law practice there. He became well known in the area and was elected twice as state legislator on the Republican ticket beginning in 1868.

In 1880 Walser bought two thousand acres of arable farmland with rich underlying coal deposits, seventeen miles to the west of Lamar at the crossing of the Missouri Pacific and Frisco railroads, six miles from the Kansas border. In defiance of the notorious Comstock Act of 1876 (see COMSTOCK, ANTHONY, AND UNBELIEF), Walser advertised his city on the hill as a place where "we could enjoy the full benefits of American citizens without having some self-appointed bigot dictate to us what we should think, speak, write, print or send through the mails."

On the original plat for Liberal, he wrote: "It is the only town in the United States set apart for Liberalism alone, and the only town of its size in the WORLD without a *priest, preacher, saloon, God or hell.*"

The population of Liberal grew to three hundred within three years of its inception, and may even have topped one thousand by the end of the century. Newcomers had to sign an agreement with Walser not to hold religious services on their properties. To curry favor with readers of *The Truth Seeker*, the largest FREETHOUGHT newspaper in circulation at the time, he deeded a lot to its editor, D. M. BENNETT, in 1881.

Liberal's institutions included a National Liberal Orphans Home, a Freethought University with a faculty of seven, a normal day school, a secular Sunday school, and Walser's own Universal Mental Liberty Hall, where public debates were held. Walser also founded an Odd Fellows fraternity he called the Brotherhood, whose particular purpose was to "visit the sick, relieve the distressed, bury the dead and educate the orphan."

For the public enjoyment and to promote a healthy lifestyle, Walser constructed and maintained a twenty-acre park that he filled with catalpa trees. In addition to being the site of his own house, the park sported a large lake for bathing and boating, open air band concerts, and picnic areas where at night, lit by kerosene lamps and the stars, the people of Liberal could join together for a merry evening of square dancing. At Walser's invitation Catalpa Park became a regular venue for American Spiritualist camp meetings (see SPIRITUALISM AND UNBELIEF).

Trouble was not long in coming. This hotbed of heathenism proved an easy target for a troublemaking Disciple of Christ preacher, Rev. Carl Braden, described in *Fifty Years of Freethought* as a "vituperative polecat" who "distributed lies by pamphlet." After a short visit Braden wrote one of his most virulent pamphlets on Liberal's sinful lifestyle, which was widely publicized by columnist Samuel Keller in the *St. Louis Globe-Dispatch* in May 1885.

Liberal fought back. One of the town innkeepers filed a libel suit against Braden for ruining his business (he had been accused of running a house of ill repute); Braden was arrested on criminal libel charges in addition to a separate embezzlement charge that had followed him from Nebraska. Both charges were later dropped.

Liberal might have managed to survive as a freethought town despite the bad press if the railroads had not raised their transportation rates, making coal mining unprofitable. With substantial holdings in the local mines, Walser got into financial trouble and sold his beloved Universal Mental Liberty Hall (UMLH) to the Methodists, who built a church on the site. Walser had invested most of his money in Liberal; Catalpa Park alone had cost him $40,000, an enormous sum in those days. Many of the original wooden buildings including Walser's own house had to be rebuilt due to a spate of fires in 1895, which demolished most of the town's businesses.

There were also serious splits among the townspeople themselves. Always the autocrat, with Walser it was a case of "either his way or the highway," so when Henry Replogle, coeditor with Walser of the *Liberal News*, asked if he could publish a second newspaper, *Equity*, to espouse free-love (see SEX RADICALISM AND UNBELIEF) and his own peculiar philosophy of Egoism, Walser saw this request as unwelcome competition. After a particularly rowdy debate at UMLH in which the free-lovers had to defend their position against the other townspeople, Replogle's house was attacked. Henry Repogle and his wife, Georgia, were literally run out of town by an angry gun-wielding mob. The couple ended up in San Francisco, where *The Truth Seeker* management was only too happy to share its presses with them.

Walser became deeply involved in Spiritualism due to his friendship with a self-styled medium, Dr. J. B. Bouton. Unfortunately Bouton was revealed as a complete fraud when his house caught fire and the firefighters revealed an assortment of trap doors, wires and pulleys, and table rapping equipment. The exposure of Bouton's shenanigans caused great amusement in the town at the time, but made Walser look rather foolish. Dating from this period there still exists in Liberal a curious wheel-shaped cemetery where, the story goes, Walser had planned to be buried in the center, so that if there was to be a resurrection all the people buried there would see him first.

Local farmers began to buy land close to the Liberal boundary and started small communities apart from the freethinkers. One was named Pedro, after a popular card game; there a saloon was established, much to Walser's disgust as he was a temperance man. The infidels turned out in force, and under Walser's instruction installed a high barbed wire fence to separate the two communities. A "Get thee out of Sodom" sign was placed close to the fence on the insurgent side, and Walser dispatched friends to the railway station to try and prevent more Christians coming to the area.

Toward the end of his life, Walser turned to religion and gave up the fight to preserve Liberal as a purely freethought town, though he stayed in the area until his death in 1910. The funeral was held at his home in Catalpa Park; he was buried together with his books, not in the Liberal cemetery, but in a mausoleum in Lake Cemetery in Lamar. The tomb bears the intertwined symbols of his Odd Fellows affiliation: *F L T* (Friendship, Love, Truth).

The Freethought University moved its operation in 1897 to Silverton, Oregon, home of an active freethinkers' group (see WAKEMAN, THADDEUS BURR).

Liberal still bears evidence of its early history, though it is now home to seven different church fellowships—one for every one hundred residents. The original street names have been preserved, named after freethought heroes such as Robert Green INGERSOLL, Charles DARWIN, and Thomas PAINE. There is also a Slenker Street, named after Elmina SLENKER, whose trial for sending sex and marriage information through the mail rocked Virginia in the 1880s and was a cause célèbre for freethinkers of the time.

Of historic note: Lamar is the birthplace of Harry S. Truman, thirty-third president of the United States, and the town where Wyatt Earp, the famous US Marshal, began his career in law enforcement in 1869 at age twenty-two. There is another town named Liberal in southwest Kansas, which got its name from its founder who gave water "liberally" to passing travelers.

ELIZABETH M. GERBER

***LIBERATOR,* THE.** For twenty years one of the most effective FREETHOUGHT newspapers in the world, the *Liberator* was founded in 1884 by Joseph SYMES as a vehicle for Australian freethinkers. Symes conceived that the *Liberator* would do for Australian readers what the *NATIONAL REFORMER* and *FREETHINKER* offered their British cousins. In the tighter colonial market, the *Liberator* would need to provide both the lengthy analysis and political commentary of the *National Reformer* and the shorter, more polemical journalism of the *Freethinker.* The first issue of the *Liberator* was released on June 1, 1884. Symes summarized the paper's outlook as republican and atheist (see ATHEISM) and open to all forms of freethought. Religious opponents were assured of a standing invitation to rebut such claims as they felt moved to.

Reaction to the *Liberator* was splenetic, with Symes being vilified as a "leprous-tongued reptile" and the journal described as "bristling with bathos and blasphemy." The cause of offense lay as much with the cartoons Symes chose to feature as with the articles. Following the example of the *Freethinker*, the cartoons in the *Liberator* satirized some of the more absurd stories of the Old Testament. Symes's articles were trenchant and combative, but never intentionally offensive.

At its heyday the *Liberator* ran as a weekly newspaper of anything up to twenty pages an issue, though it was usually between twelve and eighteen pages. Circulation ran as high as twenty thousand. The *Liberator* experienced hard times in the 1890s as an economic depression sapped the paper's readership. It was a tribute to Symes's energy and that of his courageous wife, Agnes, that the paper continued through that decade, surmounting ongoing financial hardship and harassment. The paper enjoyed a brief revival in 1897 as funds flowed in his direction following a favorable turn in factional politics of the freethought movement. But this did not last, and the last four years of the *Liberator* were as hard as any in the depressed 1890s. The *Liberator* finally suspended publication on March 12, 1904, after twenty years. Symes cited "mad legislation, wholesale sport, gambling, and Socialism in its most insane form" as the reasons for the demise of the paper. Another aspect of the problem was that Symes was not a team player and had not groomed a successor who could have carried on his work.

BILL COOKE

LIBERTARIAN MOVEMENT AND UNBELIEF. Libertarianism is politically revolutionary, affirming the primacy of individual rights over those of any groups, notably the state, throughout public affairs. Libertarianism is advanced on various philosophical grounds. Most are secular, though some Christians and other believers hold that since faith must be a matter of free choice, a libertarian society is required for bona fide faith to blossom. Though often associated with the political Right in the United States and the United Kingdom, and thus with religiously based politics, libertarianism draws its philosophical fuel mostly from nonreligious or at most mildly religious thinkers in the classical liberal tradition, such as Baruch SPINOZA, John LOCKE, Adam Smith, Thomas JEFFERSON, James MADISON, Gustav de Molinari, John Stuart MILL, Herbert SPENCER, and others.

Ancient Libertarian Intimations. In ancient China, Lao Tzu (see CHINA, UNBELIEF IN) proposed an early libertarianism by noting:

> Why are people starving?
> Because the rulers eat up the money in taxes.
> Therefore the people are starving.
> Why are the people rebellious?
> Because the rulers interfere too much.
> Therefore they are rebellious. . . .

Lao Tzu reportedly believed that all religions were superstitious and nonsensical.

An early Western inkling of libertarianism comes from a dialogue between Alcibiades and Pericles, recounted by the Greek historian and philosophical essayist Xenophon. Alcibiades argued that law rightly understood is the absence of the initiation of physical force, so that only where liberty reigns can there be genuine lawfulness. Thus, if law uses coercive force, it is not

law but aggression. If it does not use coercive force, then it is law proper. There is little evidence that Alcibiades was pious or religious.

From ARISTOTLE we learn about Lykophron and Hippodamus of Miletus, two Greek sophists (see SOPHISM) who advanced reasonably mature notions of liberty. Lykophron defended minimal government as the "guarantor of mutual rights." Hippodamus thought government should be limited to adjudicating disputes. Neither of these sophists is linked with supernaturalism.

Aristotle is often viewed as opposing classical liberalism because for him the polis must foster virtue. However, in Aristotle "the polis" can mean either the government or the community (as Fred D. Miller maintains). If it is the latter, then there need be no statism implicit in Aristotle. This is compatible with the polity of liberty, which does not conflict with the fostering of moral virtues by small, voluntary communities such as kibbutzim, the Rotary Club, or Disneyland. Aristotle's theology is minimalist—he believed there must be an unmoved mover, an idea close to DEISM.

Around the twelfth century we find a growing concern for natural rights to liberty and property. William of Occam has written that "natural [divine] right is nothing other than a power to conform to right reason, without an agreement or pact." Occam's line of analysis could be read to mean that in order for one to be able to make and act on sound moral judgments, one must also be recognized to possess basic rights, implying a necessary sphere of personal jurisdiction. Generalized, this view is comparable with Robert Nozick's modern libertarian idea of "moral space."

A radical individualism was developed by Thomas HOBBES. An absolute monarchist in his political science, Hobbes laid the crucial philosophical foundations for the *homo economicus* approach to human social life. His politics have come to be recognized as the basis for much of classical political economy. This is acknowledged by both critics and supporters of the free society, including Ian Shapiro and James Buchanan. (Shapiro notes that "[Hobbes's] negative libertarianism survived and achieved the preeminent status it did in the dominant ideology because of its affinity with these emerging economic and social relations.")

Spinoza argued that a good government will provide the people with as much liberty as possible, especially as regards the expression of political views. Spinoza's limited liberalism never quite amounted to a doctrine of the individual's right to liberty, but it would influence the development of liberal public policy.

Modern Libertarianism. The first modern philosopher with a full-blown (classical) liberal political theory is John Locke. He held that each person is by birth a sovereign with no natural rulers or natural subjects (though this sovereignty takes full effect only in adulthood). Government is established to protect individual rights, and the consent of the governed is required so as to legitimize government and to limit its powers. Locke gives a prominent place to the right to private property as an extension of the right to life and liberty. His famous exception, "the Lockean Proviso," does nothing to dampen Locke's enthusiasm for the free society, since when Locke says that we can acquire property "at least where there is enough, and as good left in common for others," all this need be construed to mean is that no legal monopolies may be established.

Locke professed Christianity, but his piety was doubted, especially by Leo Strauss and his followers, a group of scholars who link Locke to Hobbes's materialist philosophy.

Adam Smith, like David HUME, rested his defense of the liberal society first on inborn moral sentiments, and second on the public utility of having people pursue their private goals. Smith, too, appears to have eschewed supernaturalism.

J. S. Mill rested his defense of liberty on the two main ideas, first that happiness can be best pursued by free men and women, and second that happiness actually includes personal autonomy as an essential ingredient. Mill was most probably an unbeliever as well.

Herbert Spencer believed in essence that the human species is growing up—rather as Karl MARX did—and that in its fully grown state it will exhibit far-reaching individuation. In other words, the highest form of humanity is the most diversified form, which requires the scope for free action afforded only by laissez-faire capitalism. Spencer was an explicit atheist.

Carl Menger and the Austrian school—economists who stress the discovery process and entrepreneurship in market transactions and champion pure laissez-faire—drew initially on Aristotelian and individualist ethics, with the realization that the fulfillment of (even proper) individual goals is best accomplished in a free market and that economic affairs are best understood as the interplay of such diverse values by the agents who must pursue them. There is no evidence of any religious inclination on the part of Menger.

Also deserving of mention are the nineteenth-century individualist anarchists Josiah Warren, Benjamin Tucker, and Lysander Spooner, the precursors of contemporary anarcho-libertarianism (see ANARCHISM AND UNBELIEF), none of whom is closely linked with any religious thought.

Recent and Contemporary Libertarians. Recent Austrian economists who have exerted great influence on libertarian thought include the school's founding scholar, Ludwig von Mises, and his most famous student, Nobel laureate Friedrich August von Hayek; they were both explicit unbelievers. Prominent among the well-known Chicago school advocates of the free market are the Nobel laureates Milton Friedman, George Stigler, Gary S. Becker, and James M. Buchanan, none of whom is associated with any theological system.

Among philosophical champions of libertarian poli-

tics there is the intellectually influential and quite controversial atheist Ayn RAND and several neo-Randians, including David Kelley, Eric Mack, Douglas Den J. Uyl, and Douglas B. Rasmussen, none of them theists. Rand, a Russian-born novelist and nonacademic philosopher, advocated among many challenging philosophical positions the pure libertarian (or, as she called it, capitalist) society, insisting that its foundations cannot rest on faith. Murray N. Rothbard, who led the anarchist strain of classical liberalism in the twentieth century, was also an unbeliever. So have been John Hospers, Robert Nozick (the most prominent academic libertarian in the contemporary era), Jan Narveson, and Loren Lomasky.

The classical liberal tradition out of which libertarianism developed has not been espoused solely by the nonreligious. Lord Acton may be the earliest classical liberal who was importantly religious. Later examples include, in our own time, the Acton Institute cleric Robert Sirico and lay theologian Michael Novak of the American Enterprise Institute.

Still, the majority of champions of a fully free, libertarian, laissez-faire capitalist political and economic order have been unbelievers.

LIBRARY COLLECTIONS ON UNBELIEF. As Gordon STEIN, editor of the original *Encyclopedia of Unbelief,* noted in 1985, books, periodicals, and other media expressing unbelief are often difficult to locate. Most such works were—and still are—published by small publishers in short press runs (see PERIODICALS OF UNBELIEF). The population of unbelievers who actively participate in "unbelief activities" (who purchase unbelief books and periodicals or belong to an unbelief advocacy group) is very small, as is the community of believers who study unbelief. Together they may constitute less than one tenth of 1 percent of the population of the United States, or roughly 250,000 persons (see DEMOGRAPHY OF UNBELIEF). This is not a large enough population to support widespread publication of—hence easy access to—its literature. While the rise of the Internet has made it easier for contemporary atheists, agnostics, freethinkers, and humanists to share their ideas, it remains difficult to find and use collections of older unbelief items. A number of older FREETHOUGHT works whose copyrights have expired (and hence have entered the public domain) have been made available through the Kentucky-based Bank of Wisdom project, originally as scanned text files and more recently as PDF-format image files distributed on CD-ROM. Another selection of public-domain freethought works has been made available online by Project Gutenberg. Even so, a number of historic freethought works, including many of the rarest works, remain unavailable in electronic form.

Even in physical libraries access to works expressing unbelief may be made unnecessarily difficult because the material is controversial. In *Libraries in the Age of Mediocrity*, Earl Lee, librarian of the HALDEMAN-JULIUS freethought collection at Pittsburg State University in Kansas, accuses librarians of systematically misfiling freethought works. This gives the libraries that hold them a false impression that they receive little usage; the books are not being used because patrons and researchers cannot find them while browsing library shelves. This causes those works to be prematurely deaccessioned. Believing that no one is interested in these materials, librarians give over the shelf space to other works that might be better utilized. Lee points out several specific items that are frequently classified incorrectly or incompletely, thus making it unlikely that a browser walking through a library's stacks could find them. For example, consider a work whose subject

matter is the evidence for or against the existence of Jesus (see JESUS, HISTORICITY OF; BIBLICAL CRITICISM). Such a work should be cataloged under the Library of Congress subject *Jesus Christ—Historicity* (BT 303.2) or the Dewey equivalent (232.908), rather than under *Atheism, Freethought or Christianity—Controversial Literature*, where it can be found in many libraries. Today's cataloging methods make these works easier to find; cross-referencing is especially powerful in today's electronic cataloges. While this aids knowledgeable researchers in locating the works in question, especially if they know in advance that the works exist, the would-be reader browsing physical stacks remains unlikely to encounter them.

Lee points out that the reason for miscataloging could be that these works are cataloged by librarians who are subject specialists on religion and philosophy, rather than on topics of unbelief. These librarians have limited or no experience with cataloging unbelief or are "uninterested" in these works, and subsequently give works of unbelief little attention and exert little effort to catalogue them properly. Exacerbating this problem is the fact that there are very few librarians who are subject specialists in the areas relating to unbelief.

Libraries as a group are conservative in nature, and tend to present ideas seen as controversial by the general public in, at best, a limited way. Therefore, few public libraries carry these materials in any more than a superficial way; those that do so have specific reasons for doing so. Such libraries have often been given the papers and books of someone who was interested in unbelief under a bequest whose terms require the recipient libraries to hold and catalogue them. It is likely that only a fraction of the personal collections willed to public libraries reach their intended destinations. In some cases libraries refuse the bequest because of the controversial nature of the collection; in many other instances, believing family members of a deceased unbeliever destroy the willed materials before the bequest can be implemented.

Genesis of an Unbelief Library. Libraries of unbelief come into existence most often as an outgrowth of the archiving function of an organization associated with a publisher active in unbelief. The best-known libraries of unbelief in the United States all result from this type of association: the Elizabeth Elliott Library, the library of the Freedom From Religion Foundation; the Charles E. Stevens American Atheist Library and Archives (CESAALA), the library of American Atheists; the library of the AMERICAN HUMANIST ASSOCIATION; and the Center for Inquiry Libraries (CFI Libraries), which contains the library of the Council for Secular Humanism.

As mentioned before, another method in which collections of unbelief materials are gathered is through donations by individuals, the core of many of the unbelief collections held by public and university libraries. The New York Public Library (NYPL) acquired a significant portion of its freethought holdings when it received the Irving Levy Collection, which consists of mostly British but also some American freethought; the NYPL has one of the richest collections of freethought of any public library in the world.

Unbelief materials are also gathered through libraries that actively acquire them through purchase; most libraries engaging in such acquisitions already hold a core of such materials to begin with. Many of the libraries in this category, perhaps surprisingly, are theology school libraries, including the Princeton Theological Seminary, Union Theological Seminary, and Andover-Harvard Theological Library. These libraries continue actively to acquire materials in support of their collections of unbelief materials.

Unbelief Libraries of Asia, Australia, and New Zealand. India is the only Asian country with a significant indigenous tradition of unbelief (see INDIA, UNBELIEF IN) and, therefore, significant library collections of unbelief. In Chennai (formerly Madras), the Theosophical Society holds a large collection of Indian freethought journals (see THEOSOPHY; BESANT, ANNIE), and the Indian Rationalist Society holds both Indian and British Freethought items. The Periyar Centre in New Delhi also has library facilities. The Atheist Centre in Vijayawada experienced a serious loss in 1977, when some ten thousand of the fifteen thousand volumes in its library were lost to a catastrophic cyclone and tidal wave. Over the years since, this loss has been only partially made up.

Australia and New Zealand have a rich freethought history (see AUSTRALIA, UNBELIEF IN; NEW ZEALAND, UNBELIEF IN). An as yet unpublished survey by US bibliographer Bruce Cathey reports that in each country the national library has fewer unbelief-related holdings than the various state libraries. The Mitchell Library (the State Library of Sydney) contains a good collection of freethought materials of Australian origin. The National Library of Australia (Canberra) holds the Pearce Collection of freethought from both Australia and New Zealand. The Dr. Robert STOUT Collection, in the Beaglehole Room at the University of Wellington, Victoria, New Zealand, is a collection of rationalist and related materials including books and bound pamphlets, comprising items of American, British, and Australian origin.

New Zealand is home to two special libraries with freethought holdings, operated by the Humanist Society of New Zealand in Turnbull House, Wellington, and by the New Zealand Association of Rationalists and Humanists (NZARH), also publisher of the magazine *Open Society*, based in Rationalist House in Auckland. According to Cathey, these libraries hold fine collections of British and American freethought materials but are not as rich in materials from Australia and New Zealand as some of the libraries noted above.

British and Canadian Libraries. Canada is not nearly as rich in unbelief holdings as New Zealand or

Australia. The National Library of Canada in Ottawa is a repository library, so most items that have been published in Canada are held there. Also in Ottawa, the University of Ottawa holds some unbelief titles. The University of Toronto holds some Russian-language unbelief items as well.

The three best collections of unbelief in Canada reside in university libraries. York University in Toronto has a very good collection of British freethought. The Elizabeth Dafoe Library at the University of Manitoba (Winnipeg) holds the Marshall GAUVIN Collection, comprising about four thousand books plus papers and manuscripts, part of a collection donated in 1980 by the family of this prominent Canadian freethought activist. There is little Canadian unbelief here; the collection consists of most American freethought. McMaster University in Hamilton, Ontario, purchased the Bertrand RUSSELL papers and has created an archive of Russell materials.

In Great Britain, many of the libraries with significant unbelief holdings are associated with publishers of unbelief. The following are all located in London: the SOUTH PLACE ETHICAL SOCIETY has a good collection of British freethought; materials relating to Annie Besant can be located at the Theosophical Society (originally a close colleague of atheist politician Charles BRADLAUGH, Besant later turned from nontheist to Theosophist, and her unbelief items can be located along with her Theosophical writings here); the NATIONAL SECULAR SOCIETY and the RATIONALIST PRESS ASSOCIATION have significant collections on unbelief as well; the Bishopsgate Institute holds in its archives the papers of Charles Bradlaugh and George Jacob HOLYOAKE.

One of the next most significant unbelief collections in Britain is located in Norfolk. The Norfolk Public Library (Thetford branch) holds the Ambrose G. Barker Collection and Thomas Paine Society Collection. Both are very good collections of materials on Thomas PAINE—not surprisingly, as Thetford is the birthplace of Paine. Ambrose G. Barker also gave a collection of Charles Bradlaugh materials to the Northampton Public Library (Northampton was Bradlaugh's riding, or district, when he served as a Member of Parliament). In Manchester, the Co-Operative Union Institute holds additional papers of George Jacob Holyoake as well as the papers of Robert OWEN. Oxford, Cambridge, and Bristol all have collections including some unbelief materials, and can all be accessed via British online union cataloges, as can the British (National) Library.

United States Libraries of Unbelief. Since the Library of Congress (LC) functions as the de facto national library, two copies of each book published in the United States must be deposited there, in keeping with its function as a copyright library. As such, the LC holds a far greater collection of unbelief materials than any other library. The LC also holds most of the papers of nineteenth-century freethought orator Robert Green INGERSOLL. In addition, the LC is responsible for the majority of all the cataloging incorporated in the various bibliographic databases that libraries use to "copy catalog" and create their own cataloges. Most academic libraries also use the classification system created by the LC in their libraries. The familiar Dewey Decimal System is adequate for general-interest libraries, but libraries holding numerous works on closely related topics would have decimal numbers going out eight to ten places, making it much harder to use than LC Classification, which employs subject headings and corresponding classification letters and numbers.

Several US colleges and universities have significant collections on unbelief. The University of Texas (Austin), Columbia (New York City), Ohio State (Columbus), Northwestern (Evanston, Illinois), the University of Chicago, UCLA, Princeton, Rutgers (New Brunswick, New Jersey), and the University of Maryland (College Park) all have good collections in such areas as freethought, DEISM, and similar topics. The University of Wisconsin (Madison) and Yale (New Haven, Connecticut) hold collections of British freethought materials. The theology schools mentioned above have good collections, as does the Duke University Divinity School (Durham, North Carolina).

But three university collections stand out above all others. Southern Illinois University (Carbondale, Illinois) holds a large collection of Ingersoll materials and houses the Center for Dewey Studies, devoted to the work of American naturalist philosopher John DEWEY. The University of Michigan (Ann Arbor) is home to the Labadie Collection on Social Protest Movements; holdings include unbelief and such closely related topics as socialism, anarchism, and the labor movement (see ANARCHISM AND UNBELIEF; LABOR AND UNBELIEF). The Leonard H. Axe Library of Kansas State College (at Pittsburg) contains the publications and archives of Emmanuel Haldeman-Julius, publisher of the Little Blue Books and other influential mid-twentieth-century publications.

Two notable collections reside off university campuses. The Illinois State Historical Society (Springfield) contains a large volume of papers from Robert G. Ingersoll. The American Philosophical Society in Philadelphia holds the Richard Gimbel Collection on Thomas Paine, which has many handwritten items from Thomas Paine, including a manuscript for *Common Sense* (see also MONUMENTS TO UNBELIEF).

Private US Collections of Unbelief. As stated earlier, four major collections of unbelief materials are held by publishers of unbelief. The Freedom From Religion Foundation (FFRF) in Madison, Wisconsin, has the Elizabeth Elliott library, containing more than two thousand freethought books. FFRF members may borrow books, and the collection is available to researchers by appointment.

The Charles E. Stevens American Atheist Library and Archives (CESAALA), the library of American Atheists

(see O'Hair, Madalyn Murray), is located at the new American Atheist Center in Cranford, New Jersey. According to spokesperson Conrad Goeringer, as this is written the library is still undergoing some reorganization within the new facility, but the fifty to sixty thousand books originally held by Madalyn Murray O'Hair in Austin, Texas, have been received and are being placed into the Center in a climate-controlled room fitted with "dry" fire suppression equipment. Goeringer estimates the additional holdings at five hundred thousand periodicals and ephemera, plus audiovisual materials, archival materials, and papers and publications of early freethought groups such as the United Secularists of America. The library does not have public hours, but it does accommodate serious researchers; those wishing to use the facilities should contact American Atheists.

The American Humanist Association (AHA) moved from Amherst, New York, to Washington, DC, several years ago. Their collections (formerly known as the Dewey-Muller Library and Wilson Archives) include thousands of books, audiovisual materials, microforms, periodicals, and electronic media. The library contains items on freethought and humanism, but also materials on philosophy, politics, and other items that relate to their broad humanistic worldview. Again, this is a research library; workers desiring to access the collection should make an advance appointment.

The Center for Inquiry (CFI) Libraries at Amherst, New York, hold approximately fifty thousand books in addition to thousands of periodicals, newsletters, microforms, archival materials, and other items. These include the collections for the Committee for the Scientific Investigation of Claims of the Paranormal (CSICOP) and the Council for Secular Humanism. The facilities are available for serious researchers by appointment during normal business hours. The CFI Libraries employ two professional librarians, among whose priorities is cataloging rare materials collected there that are not held or cataloged anywhere else in the world. Many of the rare items were acquired from the estate of Gordon Stein, well-known freethought bibliographer and founding director of the CFI Libraries. Holdings cover such topics as freethought and secular humanism, philosophy, church-state separation, history of religions, comparative religion, and items critical of religion. There are also holdings on general topics that touch tangentially on all areas of unbelief.

Conclusion. Since the first *Encyclopedia of Unbelief* was published, the general trend has been to create privately owned libraries associated with the various causes of unbelief. The Library of Congress must by law continue to add to its collections, and the various theology schools have been acquiring some unbelief materials. Personal collections have been moving out of private hands, usually upon the death of the collector, either being destroyed by believing family members or bequeathed to the libraries of the various unbelief organizations. Readers who own an unbelief collection can ensure its future availability for use by future scholars by making advance arrangements to donate materials to one of the unbelief libraries named in this entry.

LIBRE PENSÉE, FÉDÉRATION FRANÇAISE DE LA. *Libre pensée* in French means "freethought." France is a country whose freethinkers can be counted in the millions, but where the need to belong to an association is not strongly felt. France's tradition of anticlericalism is also a tradition against the formation of mass associations, excepting trade unions. Nevertheless, the organization known as La Fédération Française de la Libre Pensée has a long history and has had a very strong influence despite its relatively small membership, which has allowed it to take often rather radical positions with regard to the problems of the nation, even on subjects far removed from the fight for secularism and for the right to unbelief, narrowly defined.

The Libre Pensée traces its intellectual and ideological heritage to Ancient Greece (Epicurus) through the Middle Ages (François Villon) and the Renaissance (François Rabelais), to the triumphs of the eighteenth-century Enlightenment and the French Revolution. The proud label of "freethinker" can be applied to all those who rejected revealed truths imposed by authorities and who dared to stand up and say "no" to obscurantism and oppression. A crucial period was the time of the Reformation, at the beginning of the sixteenth century. The Reformation was both a social rebellion and a rebellion against dogma. Religious sects proliferated, and alongside them pioneering thinkers such as Desiderius Erasmus proposed systems of free inquiry that acknowledged no revealed religion.

The Libre Pensée was founded in 1847 at a meeting of militants from the dawning republican and labor movements. Initial goals included secularism, the strict separation of religion from school and state, and an uncompromising struggle against religious oppression. The Libre Pensée included in its ranks the most famous personalities

of the nineteenth and twentieth centuries: François-Vincent Raspail, Auguste Blanqui, Victor Hugo, Maximillien LITTRÉ, Paul Bert, Ferdinand Buisson, Aristide Briand, Georges Clémenceau, Emile Zola, Romain Rolland, Victor Basch, Edouard Herriot, Anatole FRANCE, Jean Jaurès, Bertrand RUSSELL, and Jean Rostand were among its members. As of 2004 the Fédération Française de la Libre Pensée numbered about two thousand active members. In each of the *départements* (subregional governments) of metropolitan France, the Libre Pensée maintains a departmental federation of militants. It is represented in the parliament by an informal intercameral group comprising members drawn from the three chambers of the French Republic. There is an association of local politicians (mayors, and *départemental* and regional elected representatives) known as the Amis de la Libre pensée (Friends of Freethought). In addition, the Libre Pensée publishes a review, *La Raison* (Reason), with a circulation of about ten thousand. It is available wherever quality magazines are sold. The Libre Pensée publishes also a quarterly review, *L'Idée Libre* (The Free Idea). The Libre Pensée is directed by a national administrative council composed of fifteen members. The Libre Pensée is affiliated with the INTERNATIONAL HUMANIST AND ETHICAL UNION (IHEU) as full member; Christian Eyschen, in 2005 its general secretary, is a member of the IHEU's delegation to UNESCO; and Roger Lepeix is, since 2005, the treasurer of the IHEU.

The Libre Pensée is devoted to five basic principles typical of freethought activism throughout French history:

1. It is anticlerical, opposing any meddling by religion in the operation of secular society and republican institutions. It campaigns for a return to strict implementation of the landmark December 9, 1905, law requiring strict separation of church and state, which was passed on as the result of a Libre Pensée campaign. The Libre Pensée stands for an established secularism and the withdrawal of all public funds from private schools.
2. The Libre Pensée is antireligious, regarding religion as one of the main sources of obscurantism and human oppression. It believes that men and women must seize their happiness in this life, not in an extraterrestrial pseudoparadise. It rejects any claims of revealed truth, challenges all dogma, and campaigns for complete liberty of thought.
3. The Libre Pensée is antimilitarist, staunchly opposing the doctrine that people should make war and slaughter each other for interests which are not their own. It campaigns for unilateral disarmament.
4. The Libre Pensée is internationalist, valuing the interests of all people over those of any national group. In light of its antimilitarism and internationalism, the Libre Pensée has adopted a clearly pacifist orientation.
5. The Libre Pensée is anticapitalist, opposed to any economic exploitation that, like political and religious oppression, violates the legitimate rights of individuals. On the social level, the Libre Pensée campaigns for the complete emancipation of the individual.

Members of the Libre Pensée commit themselves not to take part in religious ceremonies, either for themselves and for their underage children, and to have secular funerals.

Thanks to the officers of the Libre Pensée, Roger Lepeix and Christian Eyschen, for their assistance.

JEAN-CLAUDE PECKER

LICHTENBERG, GEORG CHRISTOPH (1742–1799), German polymath, satirist, and aphorist. Like many of the "critical spirits" of the eighteenth century, Georg Christoph Lichtenberg came from a middle-class family. Disfigured by a hunchback, his professional choices were limited; he entered university academics at Göttingen, where he became professor of physics.

Lichtenberg's life was eventful, including distinguished work in applied science, travel to England (resulting in an influential book explaining the English painter/engraver William Hogarth to his fellow Germans), satirical confrontations with his academic contemporaries, and coediting a literary journal with the naturalist and revolutionary Georg Forster, known by his participation in Cook's travels. Especially in his scrapbooks, Lichtenberg developed self-reflective modernity to an impressive depth, based on his stance of "materialist Spinozism" (see MATERIALISM, PHILOSOPHICAL). He formulated the main argument against the ego-based RATIONALISM of René DESCARTES, namely, that it offers no ground for inferring a personal ego as a specific entity. He anticipated a central thesis of the later Ludwig FEUERBACH: "God created man after his image, which probably means that man created God after his own image." This should not be seen as mere witticism, but rather as the application of a more general insight into his own age, which was still struggling toward enlightenment (see ENLIGHTENMENT, UNBELIEF DURING THE) and as yet little able to frame concepts of explicit unbelief. Like most of his contemporaries, Lichtenberg found it difficult to conceive of a society entirely liberated from religion—and yet he could declare: "Our world is going to be so sophisticated one day that it will be as ridiculous to believe in God as it is nowadays to believe in ghosts."

Lichtenberg is one of the radical thinkers largely forgotten in German culture after the failed democratic revolution of 1848.

FRIEDER OTTO WOLF

LIFE, ORIGINS OF, AND UNBELIEF. Origin problems occupy a unique place in science. Everyday scientific explanation involves the formulation of general laws and principles that are meant to be tested against observable facts. Origin problems, in contrast, refer to unique events in the past, beyond the reach of direct observation. They are historical, even forensic in nature, but the attempt to resolve them casts light on deep and at times unrecognized issues in the study of the phenomenon whose origin is to be explored. For life on Earth, we are dealing with an event that took place some 3.5 to 4 billion years ago. We know (from the spectra of distant stars) that the laws of physics, and hence those of chemistry, were the same as today, but conditions on the planet were very different from now, no direct traces remain, and the mechanisms of biology had (by definition) not yet come into operation. Indeed, it is precisely the origin of these mechanisms that needs to be explained. Thus one of the major benefits of the search for the origins of life is a deepened understanding of life itself. Since the work of Benoît de Maillet and George-Louis Leclerc, Comte de BUFFON in the mid-eighteenth century, biological science has been concerned with tracing the origin and common ancestry of living things through the operation of purely natural causes. This program has been stunningly successful in explaining everything from the fossil record to the engineering strengths and weaknesses of human anatomy to the unity of biochemistry. Our current attempt to understand the origins of life on Earth represents the latest stage in this process. It has been made possible by advances in molecular biology, complexity theory, planetary science, and geology, in the past few decades. This program makes no reference to supernatural or divine agencies, and to invoke such agencies in this context would be to abandon the domain of science altogether (see EVOLUTION AND UNBELIEF; RELIGION IN CONFLICT WITH SCIENCE).

Much has changed since H. James Birx's article on this subject in the original *Encyclopedia of Unbelief*, to which we refer the reader for the older historical background. It is now possible to distinguish between the "easy question" of how the so-called molecules of life could have originated, and the much more difficult (and interesting) question of how these molecules came to be organized in a way that gives life its distinctive nature. We have much more precise information about the antiquity of life, and about the environment in which it would appear to have arisen. NASA has set up and devoted considerable resources to an umbrella institution for the study of "astrobiology," the study of the place of life in the universe, of which the study of the origin of life is an integral part. Stimulated in part by this development, astrobiology has gained recognition as an academic discipline, with useful textbooks being written at both the general and the more specialized scientific level. At the same time, the intervening decades have seen a resurgence of antiscientific, or worse, pseudoscientific, discussions of the development of living things, challenging the very notion that the origin and variety of life on Earth is amenable to naturalistic explanation. Deplorable as they may be, such challenges need to be answered.

For reasons of space, I will not provide detailed references to every point raised in this article, but have assembled a representative list of relevant texts in the bibliography; in addition, NASA and the online *Astrobiology Magazine* maintain excellent Web sites. For the same reason, I will have little to say about the possibility of life on other planets, or of life-forms not based on chemistry, or what would qualify as "artificial life." Finally, I would emphasize that many of the topics I discuss are still, in their details, matters of active scientific controversy, and that what follows should be regarded as one individual's perspective.

How is life possible? And, while we are on the subject, what about advanced life, life that can sit around a dinner table and discuss its own existence? What about life elsewhere in the universe? This last is the central question of the area of *exobiology*, a branch of science which shares with theology the distinction of having a subject matter that has not been shown to exist.

In other words, what are the things that have to happen

before you can have life as we know it, and how likely is it that all these things should happen? And, by implication, how probable was it that life would arise on Earth? Or, indeed, elsewhere? Is life a monstrous freak, a cosmic commonplace, or somewhere in between? We have no idea.

The Nature of Life. From our present perspective, the defining qualities of life are the ability to impose an extremely high degree of organization on matter in a defined region at the molecular level, and the ability to reproduce itself. Both of these seem to defy the Second Law of Thermodynamics, but the conflict is apparent only. Living systems are open systems, open to both the flow of energy and the flow of matter. The local increase in order associated with the activities of life is purchased at the expense of increased disorder, or, more technically, the exploitation of sources of free energy, from somewhere outside. In the case of life on Earth, this somewhere can be sunlight (photosynthesis), chemical disequilibria in geological systems, especially hot spots (lithotrophic and chemotrophic bacteria), or (as in the case of all animals) the degradation of living or once living tissue consumed as food. This process of imposing local order is what we call metabolism, and in terrestrial life is conducted by the catalytic action of enzymes, which are mainly protein.

If the products of this local order are not to simply diffuse away, they need to be physically confined. Thus all living things have a boundary that separates inside from outside. The vast majority of living things consist of a single cell with a cell wall. More complex organisms, including ourselves, are of course organized communities of cells. The cell wall, a basic component of all living things, is produced by the processes of metabolism.

The final essential component of life as we know it is a central information store, the genetic material (for life on earth, the DNA), which performs two subtly different functions, those of inheritance and control. For the information to be inherited, it must be copied from one generation to another. For the information to be used, it is translated through a complicated molecular machinery into instructions for making proteins, which carry out the work of metabolism. Put simply, the metabolic system carries out the operations of life, while the genetic system tells it what to do. The entire process is further complicated by feedback loops, at present poorly understood, which control the expression of genes and their response to the external (and, for multicellular organisms, the internal) environment.

Metabolic and informational activities both depend, at every stage, on the process of molecular recognition, by which chemical groups of different kinds attract or repel each other. At its simplest, molecular recognition explains why sugar dissolves in water but not in gasoline. At its most complex, it governs the way in which proteins stick to each other and in which DNA is replicated.

Thus life possesses three essential components: a metabolism, a boundary surface, and an information store. It is difficult to see how any one of these could function without the others. That is why the origin of life is such a difficult and fascinating problem.

The Antiquity of Life: Evidence from Geology. It has been seriously suggested that life evolved elsewhere in the universe, and that somehow it traversed space to arrive on, and inoculate, the early Earth. This suggestion vastly increases the space and time available, but requires incredible resilience in an organism that would have had to survive—most probably for many millions of years—the cold, vacuum, and unfiltered radiation of deep space.

The alternative, which is certainly the working hypothesis of most scientists in the field, is that life arose from nonliving matter here on Earth by the operation of natural processes. If so, we can specify the time interval involved with reasonable accuracy.

We know from extensive radioactive dating using several different isotopes that the solar system formed some 4.5 billion years ago, and the Earth-moon system some 4.2 billion years ago. This occurred by the accretion of dust to make larger particles, coalescing under the influence of gravity to form progressively larger bodies; just such processes have been seen in action around young stars. At the time when the inner planets emerged from this process, our part of the solar system would still have been full of rocky accretions, similar to those that now form the asteroid belt. In addition, icy material would have been abundant in the region of the outer planets, where the gravitational effects of chance encounters would have led to episodes of cometary infall. It seems likely that this cometary infall provided a major part of the water of our oceans, and of volatile elements such as carbon that are essential to life. Thanks to the action of plate tectonics, no part of Earth's crust survives from that period, but we have terraines on the moon that are known to be 4.2 billion years old, and the surface of Mercury and much of that of Mars is generally assumed to stem from the same period. These surfaces are heavily cratered, and radioactive dating of lunar samples indicates that this bombardment was still going strong some 3.8 billion years ago. Impacts of such magnitude on the young Earth would have boiled the oceans, although it is conceivable that life could have survived at depth and recolonized the earth. There is indeed some evidence that this is exactly what happened.

The oldest proven microfossils are around 3.65 billion years old, and so life was definitely in existence by then. However, there is geochemical evidence that life is even older. The oldest known sedimentary rocks, comprising the Isua formation of Greenland, contain granules of carbon whose isotopic composition is powerful evidence for biological processing. If so, there was life on Earth when these rocks were formed, some 3.85 billion years ago.

Thus, while the details are still uncertain, it would

seem that life appeared on Earth almost as soon as it possibly could, in geological terms. This suggests (although of course it does not prove) that the process was perhaps not all that difficult.

Evidence from Molecular Biology. Molecular biology enables us to compare genetic material from different organisms; from how widely they differ and what we know about the rate of genetic change, we can estimate how long ago they diverged. (It was actually the surrealist painter Salvador Dali who first proposed the use of this biological "soft clock.") In this way, we can construct a tree of life by extrapolating backwards from all the different surviving branches. We then find that the simplest organisms, the bacteria, which do not possess a distinct nucleus within the cell, actually comprise two distinct domains which separated some billions of years ago. (Viruses, once regarded as distinct primitive life-forms, are now seen as detached fragments of material from higher organisms.) These domains, now called Eubacteria and Archaebacteria or Archaea, differ profoundly in chemistry and most especially in the composition of their cell walls. The third and most recent domain, the Eukaryotes, includes all plants and animals. It consists of those cells with distinct intracellular scaffolding and a separate nucleus, and is essentially an early branch off from the Archaea, with major borrowing of material from Eubacteria that took up their homes inside it and became so well adapted as to fuse into a single organism. Green plants also contain material contributed from a later fusion episode, in which cyanobacteria (blue-green algae) contributed the chloroplasts that perform photosynthesis. The oldest branches, those most similar to the inferred *cenancestor* (the last common ancestor from which all organisms are descended) on both the Archaea and the Eubacteria side, all turn out to be *chemautotrophs* and *hyperthermophiles*, making their own constituent organic molecules from available simple components, getting the energy needed to do this from chemical reactions, not sunlight, and living in ocean vents or hot springs at temperatures from 70° to 100°C or more (150° to upwards of 212°F; temperatures above 100°C are possible in liquid water at ocean depths because of the pressure). One can understand that in the absence of other life to feed on, the cenancestor had to synthesize its own component molecules, and that it used chemical energy rather than sunlight to do so, since photosynthesis requires an elaborate apparatus. It was, however, totally unexpected that the last common ancestor should have been a hyperthermophile, since there are plenty of organisms that use chemical energy at temperatures in between 0° and 40°C (freezing and 100°F), the normal range for life.

There are two possible interpretations. First, life could have originated at these elevated temperatures. This appears unlikely for several reasons. Higher temperature means more random molecular motion, hampering control and making it more difficult to discriminate between wanted and unwanted reaction pathways; conditions in hot spots are unstable; and individual hot spots probably don't last that long, on the geological timescale. The second alternative is that the last common ancestor was a survivor of catastrophe. We have at hand a possible candidate, in the form of the tail end of the crater-forming bombardment. Imagine an impact not quite energetic enough to totally sterilize the earth, but large enough to raise its ocean's surface temperature to boiling. Such a near-sterilizing impact would have wiped out all life-forms except hyperthermophiles. This suggests that in the narrow time window—perhaps a mere 100 million years—between the last fully sterilizing impact and the last near-sterilizing impact, life had evolved, diversified, and filled even such difficult niches (for they are difficult) as those now resided in by the hyperthermophiles. On this interpretation, the time window becomes very narrow indeed, and the occurrence of life on other warm, wet planets seems more and more likely.

If the process occurred so readily, why do we not see life repeatedly reemerging? Charles DARWIN's speculative answer was that if it did, it would promptly be eaten. A more plausible generalization is that it would be unable to compete. The very first life-forms could go about their business slowly and inefficiently, provided only that they managed to replace themselves. It might also be suggested that life could not emerge today because of changed chemical conditions, but this is too glib an answer. The earth's surface has certainly changed from chemically reducing (i.e., richer in hydrogen and carbon than in oxygen) to oxidizing, but reducing conditions persist near midocean ridges, and everywhere at depth, much as they did 4 billion years ago.

The Nature of the Last Common Ancestor. The process of working backwards takes us to an organism (or population) from which all organisms are descended, the cenancestor. This organism was itself already highly involved in structure, with DNA, the present-day genetic code, RNA in its various functions, the same kind of translation machinery, and enzymes constructed from the same set of amino acids, as in modern life-forms. It had already experienced several gene doubling events, and comparisons between different copies of these doubled genes in the three different domains of life, while not in complete agreement, point to the conclusion that the cenancestor belongs somewhere in between Eubacteria and Archaea.

Even this may be too definite a conclusion. We have already mentioned horizontal gene transfer, all too familiar in present-day hospitals as drug resistance spreads from one strain of bacterium to another. This, presumably, occurred even more readily in the earliest stages of evolution, when organisms would have been less different from each other, and have had less sophisticated cell walls and other means of distinguishing self from nonself. In addition, the genetic repair apparatus

(which in present-day organisms is highly elaborate) would have been much cruder or totally absent. Thus, one might speculate, perhaps we should speak of a last common ancestry rather than a last common ancestor, and this may have resembled a cooperative colony, rather than a single self-sufficient individualist.

However this debate turns out, it is clear that any kind of account of the origins of life would have to explain the occurrence of organic building blocks, their assembly into molecules such as proteins and nucleic acids (highly specific nonrepeating polymers), and the development within the system of a degree of complexity far surpassing anything now seen outside of biological systems and their artifacts.

The Molecules of Life. The modern study of the origins of life is generally traced to the work of J. B. S. Haldane and, independently and at much greater length, A. I. Oparin, starting in the 1930s. Both of these suggested that surfactant (soaplike) molecules on the early Earth could have given rise to cell-like structures, precursors of the earliest organisms. The subject received an enormous boost in 1953, with the demonstration by Stanley Miller, working with the geochemist Harold Urey as adviser, that the action of light, or indeed almost any form of energy, on a mixture containing methane, ammonia, and water, would give rise to amino acids and other biologically interesting molecules. This was a breakthrough, psychologically as much a scientifically, moving the subject from the realm of speculation to that of experiment. However, its importance is all too often exaggerated. To this day, biology texts often give the impression, in their opening chapters, that these discoveries essentially solved the problem of the origin of life, and that all that remains is to fill in the details. Such claims deserve to be met with total unbelief.

First of all, Urey-Miller chemistry requires an extremely hydrogen-rich atmosphere, one in which carbon is present in the form of methane rather than carbon dioxide or even carbon monoxide. Such an atmosphere was consistent with Urey's "cold accretion" theory of planetary formation, but not with present knowledge. Second, yields are poor, and do not improve with time, as the products are transformed into intractable tar. Third, the products are not biologically signficant polymers like proteins, but rather their simpler components, and the conversion of these components to polymer in the presence of water is a process that needs an input of energy. Finally, and most important, the problem of how a disorganized mixture can be converted to the highly organized system required for life is not even touched on.

If Urey-Miller chemistry is rejected as a source for the original building blocks of life, what possibilities remain? We have at least four to choose from, and these are not mutually exclusive. I have already mentioned cometary input as a probable major contributor to the oceans. Comets are dirty snowballs, and the dirt is a rich collection of organic molecules. Second, ultraviolet light hitting the atmosphere, even in the presence of very small amounts of organic material, would generate formaldehyde and hydrogen cyanide, highly reactive molecules which are now known to be key intermediates in the original Urey-Miller experiments. Third, clays (of which more later) or other minerals could have acted as traps for solar energy, and used it to convert carbon dioxide to more interesting and useful materials. Finally, sulfur-rich minerals, such as those generated under conditions of high temperature and pressure in submarine hotspots, have been shown to react with carbon dioxide to give hydrogen-rich molecules. Very interestingly, these molecules often contain carbon-sulfur bonds, which have been postulated by de Duve (1991) and others as important in prebiotic chemistry, and which do in fact play a very active role in all living systems.

All of these mechanisms would have been available on the early Earth. We know (see above) that the process of sweeping up cometary debris had barely come to an end when life emerged; Earth's atmosphere, being devoid of oxygen and ozone, would have been far less shielded from the sun's high-energy ultraviolet light than it is today; and submarine volcanic activity would have been far more intense than it is today, when the heat-releasing radioactive decay processes that drive it have decayed to a fraction of their original power.

We are still left with the underlying problem of organization.

The Accumulation of Complexity. If the origin of organic chemicals does not present a major problem, we still need to explain the origin of organization. Organization can be accumulated with great efficiency by the processes of evolution, since incremental advantages are preserved and since the difficulties of a multistep task are added rather than multiplied. Thus, in a simple thought experiment, we can correctly assemble a correct sequence of fifty amino acids, each chosen at random from the twenty or so different kinds available, in about one hundred random trials, if we are allowed to save each correct choice. But if we had to start from fresh each time, we could expect to have to conduct around 20^{50} trials, a number with sixty-five zeros. And this corresponds to one rather small protein molecule.

In addition to the direct accumulation of advantages, there are two other extremely powerful ways in which evolution generates novel information. The first of these is accidental doubling. If a sequence is copied twice, the second copy is free to vary until it finds a new function, sometimes totally different, sometimes complementary. Thus the photosynthetic apparatus of plants contains two separate related systems, Photosystem I and Photosystem II, related by this genetic doubling mechanism, and each of these is itself the product of genetic doubling.

The second mechanism is transmission of genetic information between different organisms. Whole chunks

of information can be carried by viral vectors between one species and another. The most important and dramatic examples of such transfer appear to have taken place between very distantly related single-celled organisms, the Archaea and the Eubacteria, whose fusion gave rise to the Eukaryotes.

The Central Problem. If there is no difficulty in accounting for the organic chemicals of which life is constructed, why do I not regard the problem of life's origins as solved?

Life as we know it requires a metabolism (based on enzymes, which are mainly proteins), and a heredity mechanism (principally based on DNA). Without enzymatic activity, DNA could not be replicated; without recourse to the information stored in the DNA, specific enzymes could not be synthesized. This is a chicken and egg problem of some severity.

The situation is even more puzzling than this suggests. Regardless of details and division of labor, the apparatus of any replicating cell must be of great complexity. As we have seen, the mechanism by which living forms have in diverse ways generated such complexity is by evolution and selection. This process works by continual tinkering. Incremental advantages in one generation of species are built upon in subsequent generations. What was once incremental can then become essential, being built into systems of ever greater elaborateness. The backbone of vertebrates, for instance, would at first have arisen as incrementally useful stiffening, but is now the essential centerpiece of a highly elaborate internal skeleton. Contrary to the claims of the promoters of intelligent design (see CREATIONISM; INTELLIGENT DESIGN THEORY), there is no such thing as "irreducible complexity" in biology. There is, however, one critical constraint on what can be generated by descent with variation. Whatever is generated by this mechanism cannot be essential to the organisms in which it first arises. For if it were, their immediate ancestors would not have been viable.

Now apply this principle to the actual process of duplicating genetic information. If this is essential for the operation of descent with variation and selection, it could not have been brought into being by this mechanism. We appear to be faced with a paradox.

Logically, there are only two escape routes available. We can say that the original genetic apparatus was readily accessible on the early Earth, and thus antedates evolution; this gives us what Dyson (1985) refers to as "genes first" theories. Or we can say that a distinct genetic apparatus was not necessary for the first evolving organisms, but represents a subsequent specialization; this gives us "metabolism first" theories. Both "genes first" and "metabolism first" theories presuppose the existence of some satisfactory enclosure, or adhesion to a surface, providing a defining boundary. Mirroring the three components essential to life, we have three separate emphases regarding its origins, as will be evident in the next section.

Some Current Approaches. At a high level of abstraction, the emergence of life can be seen as a special case of the spontaneous emergence of order far from equilibrium. This is a common enough phenomenon, visible in mottled cloud patterns, much studied in "chemical waves" of reactivity that spread through systems which create their own catalysts, and invoked, with uncertain success, as one agent in embryonic development.

Generating complexity is one thing; generating complexity that contains instructions for its own replication is quite another. The key factor here would be molecular recognition. Imagine, for instance, a network of molecules each of which, by such a process, catalyzed with some degree of specificity the formation of other molecules within the network. It can be shown, as, for instance, in Dyson's treatment, that such a system would become spontaneously self-refining once a critical degree of accuracy had been reached. This is a "metabolism first" scenario; catalysis precedes information storage.

Speculation of this kind will carry much more conviction if it becomes possible to point to real systems that catalyze each other's production in the required manner. Such systems are being approached from several different directions, using molecules with specific binding patterns to trap and orient complementary fragments. The binding motifs used are commonly inspired by those found in actual biological systems. This could represent a shortfall of imagination, or it could be regarded as deep wisdom, building one's machinery like any good engineer from components that are known to work.

Ribozymes, discovered in 1982, are pieces of ribonucleic acid that can function as enzymes. This gives us the liberating idea that the same material might at the origins of life have had both genetic and metabolic functions. Even before ribozymes were discovered, it was known that many catalytic processes require coenzymes incorporating nucleotides, as the building blocks of nucleic acids are called. Enthusiasts for ribozymes even speak of an "RNA world" as a distinct stage in the emergence of life. RNA is chemically simpler to produce than DNA, and single chains of RNA are somewhat more flexible. For these reasons, DNA is thought to be more recent than RNA, to be purely informational in function, and to have developed because it can be copied between generations with greater accuracy.

Between the "RNA world," if such a thing ever existed, and the most complex products of abiotic chemistry, there is still a huge gap to be bridged. RNA is a polymer, in which the information containing components are strung out along a chain made out of sugar (ribose) molecules and phosphate groups. Sugars are easy enough to build from simpler components, but the reaction is messy and gives rise to literally hundreds of different products. The sugar-phosphate bond is unstable in water, and a dehydrating agent is needed for its formation. Finally, the number of possible different RNA molecules that would perform any useful function, however poorly, is a small fraction of the total possibilities, just as

the strings of letters that convey a message, however brief or banal, form a small fraction of all those that could arise by chance. Even a single functional RNA molecule represents such an enormous improbability, relative to nonliving matter, that from the present point of view it is closer to the winning post than the starting line. Inspired by such reasoning, much recent research is based on simplified alternatives to nucleic acid, and on substances that could have done double duty as building blocks for nucleic acid–like or for proteinlike molecules.

Before life there were minerals, and minerals are highly structured. This structure could have contributed to the emergence of life in a number of ways. Minerals most certainly possess the ability to concentrate organic molecules, catalyze their reactions, and impose specificity on otherwise messy processes. Indeed, much of the modern chemical industry relies on these facts. This gives them a minimal role, as substrates on which critical reactions could have taken place. Or, as mentioned earlier, the minerals themselves could have been critical reagents, converting even such unpromising materials as carbon dioxide into useful building blocks, possibly even activated by the presence of carbon-sulfur bonds. In one variant of this scenario, minerals could have acted as photosensitizers, traps for the energy of sunlight. The boldest claim made on behalf of minerals is that they could themselves have been the first replicating systems undergoing selection pressures. Clay minerals show huge richness of structure, and it is easy to envisage them being selected for catalytic properties, especially if (as certainly seems possible) the products of such catalysis would in turn promote the production of more clay, for instance by reacting chemically with igneous rocks. Earlier claims of replication in clays have unfortunately not been substantiated, but reexamination of this possibility seems timely.

As for the origin of the membrane, this is the least of our problems. If the critical stages in the origin of life took place on the surface of minerals, or in their internal space, the minerals themselves would have fulfilled the original membrane function. If not, almost any organic molecule with a water-attracting and water-repelling region (in structural terms, oxygen-rich and hydrogen-rich region) could have formed part of a cell wall, with the water-attracting parts facing outward, and the water-repelling parts tucked inward. Such rough and ready cell walls would certainly have been leaky, but this could actually have been an advantage, since such leaky walls have been shown to admit simple monomers, while preventing the escape of bulkier and more complex products built up from them.

At an origins of life conference, you will find devotees of all these approaches, and others I have not mentioned, hotly discussing the advantages of their own scenario at the implied (or even explicit) expense of all the others. But standing back a little, it seems clear that the emergence of life was a multistage process, with different kinds of mechanisms operating at different stages.

Practical Applications of Origins-of-Life Research. Advances in several commercially or medically important areas have been directly inspired by origins-of-life research. Models of the "RNA world" spurred the development of antisense RNA-binding drugs, which inhibit the replication of retroviruses (including HIV). Studies of hyperthermophiles have led to the isolation of heat-resistant enzymes, with uses ranging from biotechnology to the domestic washtub. Close scrutiny of molecular interaction has given us methods for creating new enzymes, and, more generally, fresh insights into molecular self-assembly. There are numerous foreseeable applications in catalysis and nanofabrication, and doubtless even more important applications that have not yet been foreseen.

Conclusions. The problem of the origins of life is still unsolved. Or, more accurately, it is incompletely solved. We have fragmentary and partial solutions, but do not know how they connect. It is a little like having fragments of a proposed travel plan, which cannot be evaluated until the complete route is in our hands.

We should also frankly face the fact that our knowledge of the remote past is uncertain, and the implication that when surveying the specific alternatives, we may be unable to choose between them. Nonetheless, we are much closer than a generation ago to identifying the general processes involved. Consider as an analogy trying to reconstruct the journey of Lewis and Clark from a current road map of the northwestern United States. A seemingly impossible task! However, we would notice that there were very few roads across central Idaho, and infer the existence of obstacles, which we would identify with mountains. We would notice that these mountains were most easily crossed through valleys associated with rivers, and hypothesize that the rivers had worn these valleys away. We would do model experiments to show that flowing water does indeed wear away soil, and speculate that Lewis and Clark had crossed the mountains by following a great river. We could not say exactly which fork of which river they used, but despite this we would have shown what the correct solution to our problem should look like, and learned a great deal about other matters in the process.

PAUL S. BRATERMAN

LIFE STANCE. Life stance denotes an individual's or a community's relationship with what he, she, or it finds to be of ultimate importance; the commitments and presuppositions of this; and the theory and practice of working this out in living. The term refers both to the style and to the content of that undertaking.

One's "stance" should be the secure base for one's action. A good "stance" is basic to success in almost any sport. One's "life stance" is the dynamic base for one's life.

The definition of the term is explicitly designed to be impartial between the different foundations on which people base their life stances. Humanists find the happiness and suffering of individual sentient beings to be of ultimate importance (see HUMANISM), and the human qualities that enable us to ameliorate the happiness and suffering in the world (see MORALITY FROM A HUMANIST POSITION). Religions find a superpurposive reality to be ultimately important, typically a God (for more on the basic divide between naturalistic and superpurposive, see RELIGION; NATURALISM). The concept of life stance is inclusive, and not itself "judgmental." It also includes commercial materialism: the acceptance that money and the possession of goods is ultimately important.

The relation of life stance to religion on the one hand, and to science on the other, is critical, and humanism furnishes a critical example. These relations involve two dichotomies: that between a naturalistic claim and one that is superpurposive; and that between a factual claim and one that is evaluative.

	Factual	Evaluative
Naturalistic	Science A naturalistic life stance is both factual and evaluative	A naturalistic morality
Superpurposive	Theology	A religious morality A religion is both factual and evaluative

Many religions (including Christianity) also imply factual statements that are naturalistic. Their claims therefore interact with science.

It is perverse to contrast religion and science (see RELIGION IN CONFLICT WITH SCIENCE), and then suppose (as many religious people do) that as humanism is based on science it will not give values. Humanism is *based on* science, but has fundamental values as well. It is equally perverse to run humanism and atheism together (as many religious people do). ATHEISM clears the ground, but humanism is a life stance, and therefore it sets positive beliefs and values in the empty space.

Any understanding of morality must be founded on claims about the world and what is important in it. (One cannot get morality a priori; a real morality must refer to something.) One finds these claims in one's life stance, if one is interested in foundations.

Many people lead their lives without thought of any life stance. Most such people live according to the way they have been brought up and the culture in which they live. This opens a serious question. The quality of life in a society is very much dependent on the quality of the life stance or life stances that are implicit in it. What is the quality of *your* culture? Many humanists find commercial materialism on the one hand, and religion on the other, much too influential in Western societies. It is, then, up to them to make humanism influential in their own society.

Can there be a life stance which will be generally accepted all over the world? Not in the foreseeable future. The fact that human nature is universal does not mean that humanism could be this life stance. All life stances do indeed share a range of important moral values, because we all are of the same human nature. But human nature is not so rational that evidence will lead everyone to accept one answer on these matters. The general rejection of gods is far over the horizon! This will lead to life stances with vitally different moral theories. Most religious life stances call upon their God to condemn certain things—homosexuality, the equal rights of women (the *majority* of Christians worldwide reject the equality of women in the priesthood), and so on.

It is interesting to note how Christians, and god-religious people in general, do not want to open up the idea of "religion" in this way. Perhaps they instinctively recognize that this opening up is a vital threat to them and their authority. Religion can do good: it inspires commitment and a morality, and it can support people in leading good lives. But the religious element in most religions distorts their moral theories, and can make them damaging. Once people see that the good in religion does not necessarily presuppose a God, then the authority of Christianity and its privileged status are both lost. Then humanism must be admitted on equal terms.

"Life stance" is the genus that includes humanism, Christianity, Islam, and so on ad infinitum as species (see also EUPRAXSOPHY). To distinguish a particular life

stance from any other mental phenomenon such as philosophy, culture, ideology, a religion, or science will specify the genus, life stance; and the particular claims it makes, and the particular values and principles that inform and guide its activity. This is how the INTERNATIONAL HUMANIST AND ETHICAL UNION sets out its "Minimum Statement of Humanism," which is accepted by all its member organizations.

HARRY STOPES-ROE

LINDSEY, BEN (1869–1943), American sex radical (see SEX RADICALISM AND UNBELIEF). Benjamin B. Lindsey was born in 1869 in Jackson, Tennessee, to Landy Tunstall Lindsey and Letitia Barr Lindsey. Landy, a Civil War veteran and an alcoholic, caused a family rift when he converted to Catholicism. In 1879 he moved the family to Denver. A year later, Ben and his younger brother, Chal, were sent to Catholic boarding school in Indiana. Ben's experiences there were fairly agreeable. He was exposed to the positive side of the church and made a lifelong friend of one of the nuns there; however, he later attributed his lack of trust in organized religion to that early family conflict.

Two years later Landy lost his job, and Ben and Chal were removed from the boarding school and sent back to Tennessee to live with their grandfather. Ben attended Southwestern Baptist University, a preparatory school, for three years, after which he returned to his parents in Denver. Rather than finishing his education there, he was forced into full-time employment, along with his brother, as a result of his father's ill health. Distraught over his illness and economic circumstances, Landy committed suicide; it was Ben who discovered his father's body in the cellar. As the new head of the family, Ben Lindsey worked two jobs, including one as a clerk in a law office, but the family remained in poverty. Exhausted and utterly discouraged at his inability to improve his family's situation, Lindsey attempted suicide by placing a gun to his head and pulling the trigger, but the gun did not go off.

Lindsey used this fortunate event to sink himself into the study of law, and in 1894, at the age of twenty-five, he was admitted to the bar in Colorado, and was soon assigned as public defender. After a series of political appointments, at the age of thirty-one he was asked to fill a vacancy in a county judgeship.

Early on, Lindsey developed an effective and innovative method of dealing with juvenile delinquents. Over the course of his judicial career, Lindsey became the most active and successful advocate of child law reform in United States history, and he pioneered the juvenile court system.

Lindsey was convinced that many of society's ills rested on its puritanical and repressive ideas about sex. Authors Havelock Ellis and Walter Lippmann had a strong influence over Lindsey's intellectual development. He wrote several books and articles on the topic, including *The Doughboy's Religion* (1920), *The Revolt of Modern Youth* (1925), *The Companionate Marriage* (1927), and his autobiography, *The Dangerous Life* (1931). His books advocated sex education for young people; accessible birth control for women, including unmarried women (see BIRTH CONTROL AND UNBELIEF); and uncomplicated divorce for childless couples.

Well known for his compassion and idealism, Lindsay remained active in liberal causes throughout his life, although in 1927 a political feud resulted in his removal from the bench, and he was disbarred in Colorado. He was eventually elected to the Superior Court of Los Angeles County. He died at the Good Samaritan Hospital in Los Angeles on March 26, 1943.

JULIE HERRADA

LITTLE BLUE BOOKS. See **HALDEMAN-JULIUS, EMANUEL.**

LITTRÉ, ÉMILE (1801–1881), French philologist and positivist. Maximilien Paul Émile Littré is chiefly remembered for his contributions to French philology and lexicography and his research into ancient medicine. Especially noteworthy is his monumental *Etymological, Historical, and Grammatical Dictionary of the French Language* (1863–77). Less well known but equally important is his role as spokesperson for POSITIVISM.

His positivist involvement began in 1840 when he first read Auguste COMTE's *Course in Positive Philosophy* (1830–42). Four articles by Littré in *Le National* in 1844 were the first writings to present Comte's theories to the general public. Basic Comtean ideas popularized by Littré then and subsequently included the assertions that all religions are destined for extinction, that objective observation and scientific method are the only valid means of arriving at truth, and that all religious claims amount to unverifiable hypotheses.

Littré broke with his mentor in 1852, rejecting the mysticism of Comte's "second career." An ardent republican, he was further repelled by Comte's support of the Second Empire of Napoleon III. Henceforth Littré would

continue to disseminate the tenets of the *Course* while dismissing Comte's second phase as an aberration.

Littréist positivism gained a forum in 1867 when Littré and the Russian scientist Grégoire Wyrouboff founded the bimonthly review *La Philosophie positive* (Positive Philosophy). The periodical survived until 1883, with Littré contributing some sixty articles.

For much of his life Littré was vilified as the embodiment of antireligion and atheism. (In his 1855 *Dictionary of Medicine*, he provoked a scandal by defining man as "a mammalian primate with opposable thumbs.") When he applied for admission to the French Academy in 1863, the powerful prelate Bishop Félix-Antoine Dupanloup, himself an academician, denounced Littré as an archmaterialist and successfully thwarted his election. When Littré's second application was accepted in 1871, Dupanloup resigned his own chair in protest.

Following Littré's death, a rumor circulated that he had undergone a deathbed conversion (see DEATHBED CLAIMS CONCERNING UNBELIEVERS). This alleged reversion to Catholicism was refuted by Wyrouboff, who dismissed the claim as sensationalism fabricated by *Le Figaro* in an effort to boost sales. The *Catholic Encyclopedia* maintains the truth of this fabricated story to this day.

WILLIAM RAYMOND CLARK

LOCKE, JOHN (1632–1704), English political philosopher and empiricist. John Locke is a key figure in the history of British empiricism and liberal democratic theory. His works on religion and on education are less read today, but were significant in the history of those subjects. Locke's father was a Puritan, on the side of Parliament in the Civil War. Locke was a student and teacher at Oxford University. He was a fellow of the Royal Society and a friend of Robert Boyle; he trained as a physician. His early career developed in association with the first earl of SHAFTESBURY, who rose to become Lord Chancellor. Shaftesbury fell from power in 1673, and Locke was twice forced to leave England for reasons of security. His famous *Two Treatises of Government* were not published until after the Glorious Revolution of 1688.

Locke returned to England in the entourage of William and Mary in 1689, and within a year published not only the *Two Treatises of Government* (1689) and the first *Letter on Toleration*, but also *An Essay concerning Human Understanding* (1690), now universally regarded as a foundational text of empiricism. Locke served as an advisor to the Whigs, and his later writings include works on religion, on money, and on education. During his last years he was a commissioner on the board of trade.

Locke's Importance. Locke is one of the most important figures in the history of English philosophy. His *Essay* served as a basic textbook to several generations; the influence of his political ideas is so pervasive that scholars have stopped trying to uncover it. The writings on religious tolerance and in defense of religion place religion within the limits of REASON. Locke's idea of tolerance did not extend to Roman Catholics or to unbelievers, and although his religious theories led to accusations of his being an opponent of religion, these same works served as an inspiration to liberal elements (the latitudinarians) in the Church of England. Locke's political theory, while undoubtedly of the highest importance, also has an ambiguous element.

The Political Philosophy. Locke agreed with Thomas HOBBES about the dangers to life in the state of nature, but he thought the solution was to transfer to government only limited authority, not full sovereignty as Hobbes urged; and whereas Hobbes allowed revolt only when the government directly threatened one's life, Locke set the conditions of revolution much lower. His favorable reception in the American colonies therefore comes as no surprise.

Locke's doctrine of property is central to his political work. Locke was no armchair philosopher; he had considerable practical experience with political issues. In the first *Treatise of Government*, Locke argues against Robert Filmer, who followed the biblical account of property, namely, that God had given dominion to Adam and his heirs. This treatise is of particular interest since Locke proposes an interpretation of scripture that is the result of original thought and not just the conventional citing of proof texts. Still, it is in the second treatise that we get the well-known and classic doctrines that originally the earth was common to all, but every man had a property in his own person and in what was produced by the labor of that body. By eating I made part of what was common literally part of me, and by mixing my labor with parts of what is common I remove those parts from the common.

The Theory of Knowledge. The great *Essay concerning Human Understanding* cannot be considered an easy read, and its contents have been analyzed and evaluated from every conceivable angle. Locke is to English philosophy what René DESCARTES was to French and Gottfried Wilhelm von LEIBNIZ to German, and should be read in that context. Leibniz wrote an extended commentary on Locke, and Locke's introduction of the con-

cept of an *idea* into English brings him closer to Descartes than one might expect, given his association with the empiricism conventionally opposed to Cartesian RATIONALISM. Another difficulty is caused by the understandable habit of students not to read large treatises in their entirety but to be content with digests or abridgements.

What makes the *Essay*, though seriously dated, still breathtaking is the boldness of its conception. Right at the time so many empirical discoveries were being announced and so many scientific theories were under revision, Locke proposed to review the entire "compass" of human knowledge, and to examine critically the whole field from sense perception to language to morals, in all cases carefully distinguishing between that which is certain and that which is merely probable. In one important section he classifies the logical fallacies according to a scheme still widely taught today. His analysis of memory is still useful, and Locke's theory of personal identity is a classic and still discussed at length. Even though the *Essay* is a carefully organized and systematic treatise, it is not easy to place Locke in any one philosophical camp. For example, he is called an empiricist because he traces all our ideas to experience, there are no innate ideas for him; but he does not construct knowledge directly from the observations. Knowledge, for Locke, is the perception of the connection and agreement or disagreement of our ideas.

Continuing Relevance in Religion. Locke's treatment of religion reaches some conclusions that force us to classify him as a believer. He gives a proof of God's existence and defends the possibility of revelation. He believed in a future life and affirmed that Jesus was the Messiah. Most orthodox religionists were nevertheless unhappy with Locke, since he always gives reason the upper hand. The clear implication of his writing on religion, and what makes it important for skeptics and unbelievers, is that while he endorses some religious beliefs he does so only because he thinks there are rational grounds for them. Locke's theory has come to be called "EVIDENTIALISM" and is often severely criticized by conservative philosophers of religion today. Religionists, especially those committed to religious dogma come what may, have good reason to stay clear of Locke. Skeptics are perhaps in a more comfortable position. On the one hand, Locke's evidentialism and his general empirical ethics of belief is acceptable to them, and on the other, if Locke or one of his followers is able to demonstrate or present convincing evidence for a religious claim, then there is no reason for the rational skeptic not to accept that claim. Presumably, the skeptic's commitment to reason and free inquiry takes precedent over dissent from any particular religious article of faith. If one insists on some form of evidentialism as a standard of belief, then fairness requires one put one's own beliefs on the table to be subjected to scrutiny. Dogmatic unbelievers, on the other hand, even if they turn out to be right, have nothing over dogmatic religionists, at least from the point of view of knowledge. John Locke is one of the great founders of the liberal school of religion, which dominated in the Church of England, at least among the bishops, during the Whig period of the eighteenth century. Locke's theological heirs are a diverse lot; while some merely emphasized the value of experience and probable reasoning, others challenged the more severe Christian doctrines such as the Trinity and the Incarnation. This legacy includes many deists (see DEISM) and those who reduced Christianity to a system of moral teachings that could easily be accepted by a compassionate atheist (see RELIGIOUS HUMANISM).

LOGICAL POSITIVISM. Also known as logical empiricism or logical neopositivism, logical positivism is a philosophical movement that originated in Austria and Germany in the 1920s. Concerned primarily with the logical analysis of scientific knowledge, it held that statements about metaphysics, religion, and ethics are devoid of cognitive meaning and thus nothing but expressions of feelings or desires; only statements about mathematics, logic, and the natural sciences have definite meanings. Principal exponents included Rudolf Carnap, considered the leading figure of logical positivism; Herbert Feigl; Philipp Frank; Kurt Grelling; Hans Hahn; Carl Gustav Hempel; Victor Kraft; Otto Neurath; Hans Reichenbach; Moritz SCHLICK; and Friedrich Waismann.

History. Albert Einstein's theory of relativity exerted great influence over the origin of logical positivism, its founders seeking to clarify the theory's philosophical significance. Schlick wrote two essays on relativity in 1915 and 1917; Reichenbach attended Einstein's lectures on relativity theory at Berlin University in 1917 and wrote four books on the topic in the 1920s; Carnap's first work was an essay about the theory of space published in 1922. Quantum mechanics was also a major subject for philosophical investigations; works in this area were published by Schlick and Reichenbach. Another influence upon logical positivism was the

development of formal logic. Carnap attended three courses on logic under the direction of Gottlob Frege, the father of modern logic. In addition, the logical positivists had extensive contacts with a group of Polish logicians (mainly Jan Lukasiewicz, Kazimierz Ajdukiewicz, and Alfred Tarski) who developed several branches of contemporary logic including the algebra of logic, many-valued propositional calculus, and semantics for logic.

By the 1930s logical positivism was a prominent philosophical movement actively promoting its new ideas in Europe and the United States. Meetings on epistemology and the philosophy of science were organized at Prague (1929 and 1934) and Konigsberg (1930), where Kurt Gödel presented his influential theorems asserting the completeness of first-order predicate calculus and the incompleteness of formal arithmetic. The First Congress of Scientific Philosophy was held in Paris (1935) and subsequent congresses were held in Copenhagen (1936); Paris (1937); Cambridge, UK (1938); and Cambridge, Massachusetts (1939).

The political attitudes of logical positivists were progressive, democratic, and sometimes socialist; this aroused hostility from the Nazis. After Adolf Hitler seized power in 1933, many logical positivists were persecuted and forced to emigrate from Austria and Germany; Schlick and Grelling were murdered. Neurath and Waismann sought refuge in England. The United States became the new home for most of the others: Carnap taught at the University of Chicago and UCLA; Feigl at the universities of Iowa and Minnesota; Frank at Harvard; Hempel at Yale, Princeton, and the University of Pittsburgh; and Reichenbach at UCLA.

Meaning. According to logical positivism, all meaningful statements can be divided into two classes. One class contains statements that are true or false by virtue of their logical forms or their meaning; these statements are called analytic a priori. The other class contains statements whose truth or falsity can be ascertained only by means of experience (called synthetic a posteriori). Logic and mathematics belong to the class of analytic a priori statements, since they are true by virtue of the meaning ascribed to the logical constants (the words *and*, *or*, *not*, and *if*) and to mathematical terms. The class of synthetic a posteriori statements includes all genuine scientific statements, such as those of physics, biology, and psychology. A statement is meaningful if and only if it can be proved true or false, at least in principle, by virtue of its meaning or by means of experience. Moreover, the meaning of a statement is its method of verification: that is, we know the meaning of a statement only if we know the conditions under which the statement is true or false. This assertion is called the verifiability principle (see VERIFICATIONISM). Thus statements about metaphysics, religion, and ethics are meaningless and must be rejected as nonsensical. Much of traditional philosophy is meaningless as well. Many alleged philosophical problems, such as the controversy between realists and instrumentalists, are actually pseudoproblems, the outcome of a misuse of language. They concern not matters of fact but rather the choice between different linguistic frameworks. Thus the logical analysis of language was regarded by logical positivism as a major instrument for resolving philosophical problems. Characteristic of this was the intense analysis of scientific language performed by Carnap and Hempel.

Scientific Language. According to logical positivism, a scientific theory is an axiomatic system that acquires an empirical interpretation by means of suitable statements—called coordinative definitions or axioms of coordination—that establish a correlation between real objects or processes and the abstract concepts of the theory. The language of a scientific theory includes three kinds of terms: logical, observational, and theoretical. Logical terms denote logical constants and mathematical objects; observational terms denote objects or properties that can be directly observed or measured; and theoretical terms denote objects or properties we cannot observe or measure but can only infer from direct observation. Examples of theoretical terms are *electron*, *atom*, and *magnetic field.* Early logical positivism believed that all theoretical terms were definable with the help of observational terms. Further research by Carnap and Hempel showed that theoretical terms cannot be defined by observational ones; therefore, theoretical terms are indispensable to any scientific theory.

Logical positivism did not consider the pragmatic aspects of scientific research; it was concerned not with the real process of discovery but with the rational reconstruction of scientific knowledge—that is, the study of the logical (formal) relationships between statements, hypotheses, and empirical evidence.

Ethics. The logical positivist most interested in ethics was Schlick. He endeavored to give an account of ethics in agreement with logical positivist philosophical principles. Schlick maintained that ethics is a descriptive scientific theory: statements about ethics are not normative statements prescribing how people ought to behave, in which case they would be meaningless according to the verifiability principle. Schlick understood statements about ethics as descriptive statements relating to the origin and the evolution of the ethical principles in human society. He asserted that human beings naturally prefer conditions that do not produce pain and do produce pleasure; thus, in the first instance, the good is simply that which gives pleasure and no pain. The very first ethical principle is therefore egoistic, but human behavior is subject to the evolutionary processes that sometimes select an altruistic or cooperative way of action as better adapted than a purely egoistic one. This is particularly true in a complex human society, where we can find a struggle between egoistic behaviors arising from human nature and social behaviors generated by the evolutionary process.

MAURO MURZI

LOISY, ALFRED FIRMIN (1857–1919), French scholar and philosopher. The great spearhead of Catholic Modernism, Alfred Firmin Loisy was born in 1857 to a farming family in the village of Ambrières, France. At age seventeen he undertook studies for the priesthood. A pious and gifted student, he went on to study at the Institut Catholique in Paris in 1878 and was ordained the following year. Though scientific biblical criticism was rare in France at the time, Loisy imbibed it from the lectures of Abbé Vigouroux—an orthodox apologist who explained critical views in order to refute them, but whose rationalizations Loisy could not accept—and Ernest RENAN. His doctoral dissertation, which remains unpublished, was prescient in arguing that any modern doctrine of biblical inspiration must be corrected and informed by the results of criticism and could not limit them.

Loisy's teaching of the Hebrew Bible at the Institut piqued the suspicions of his superiors, who fired him in 1893. His subsequent teaching as chaplain at a Dominican convent school awakened in him a desire to help midwife Catholicism into the modern world. In 1899 he moved on to a post at the École Practique des Hautes Études where he could work free of inquisitorial scrutiny. In 1902 Loisy composed *The Gospel and the Church*, a rejoinder to the newly translated manifesto of liberal Protestantism, *What Is Christianity?* by Adolph von Harnack. Harnack argued that Jesus had propounded a threefold gospel of the fatherhood of God, the coming of the kingdom of God, and the infinite value of the human soul, all of which reduced to pious devotion to God the Father (not to Jesus himself) as the very essence of Christianity. This was the kernel of Jesus's preaching, from which theology must separate the husk of contemporary apocalyptic and other Jewish thought-forms. Harnack viewed all subsequent Christian history as distortion and betrayal of the kernel of Jesus's filial piety.

Loisy saw here an opportunity to float his approach to modernizing the Catholic tradition. Loisy was inspired by John Henry Cardinal Newman's theory that Catholic theology had indeed developed (in contrast to the traditional position that the Church had never changed), but under the guidance of the Holy Spirit and in harmony with its inner logic. Even so, Loisy urged that what Harnack had called the kernel was really the *seed* of the gospel. What Harnack dismissed as the husk was rightly to be understood as the mature and still-growing *oak*. He also argued that Harnack had no business as a historian in trying to distill some abstraction of an ancient set of beliefs. (Today he would rightly have accused Harnack of "logocentrism.") No, argued Loisy, Christianity began as a social movement and continued to survive by adapting to a changing world. And so must Catholicism adapt today, for example, by accepting biblical criticism. Loisy was excommunicated in 1908. He was ahead of his time, as history would reveal. For instance, in the late twentieth century, Raymond E. Brown, also a Catholic priest, easily obtained the imprimatur, or mark of church approval, for critical work reminiscent not only of Loisy but of David Friedrich STRAUSS.

In his 1902 *The Religion of Israel*, Loisy outlined the current positions of Old Testament criticism after the seminal Old Testament scholar Julius Wellhausen. Chief points in which biblical science has since surpassed Loisy include his belief that Yahwism had always been monolatrous, repelling the syncretistic addition of foreign gods (today's scholars view ancient Israel as simply one more native Canaanite group, sharing the regnant polytheism except with different, local divine names) and his post-Exilic dating of the Psalms (which form-criticism since Sigmund Mowinkel places firmly, for the most part, in the Jerusalem Temple liturgy during the Monarchy). Loisy's neglected original insights include the notion that Jeremiah's accusation of scribal falsification of the Torah (Jer. 7:22; 8:8) had in mind the seventh-century fabrication of Deuteronomy, and that Ezekiel's rich mythic allusions attest a secret priestly "gnostic" syncretism in Judah stemming from the reign of Manasseh.

Loisy's major New Testament work may be found in his posthumously published *The Birth of the Christian Religion* (1948) and *The Origins of the New Testament*

(1950). He was a radical critic, dismissing by far most of the gospel narrative as liturgical drama and legend, though he rejected the Christ myth theory, preferring to see Jesus as a rebel prophet like Theudas the Magician or the Egyptian messiah, both mentioned by Josephus. Loisy understood Romans and both Corinthian epistles as compilations of materials from various sources, and questioned the authenticity of Galatians. Among his numerous sadly neglected observations are that 2 Peter 1:16–18 refers not to the Synoptic transfiguration story, but to an episode in the noncanonical Apocalypse of Peter; that the Field of Blood (Matt. 27:8; Acts 1:18–19) was originally the burial place of Jesus, not the site of Judas's death; that the story of Peter's cowardly denial is unhistorical smear propaganda put about by Paulinists; that Matthew's beatitude upon Peter (16:17) was a later Petrinist counterclaim to Galatians (1:11–12, 15–16); that the empty tomb of Jesus was a rechristening of a grotto believed sacred to the resurrected Adonis; that Pilate's verification of Jesus's quick death (Mark 15:44–45) is an apologetical fiction to rebut the suspicion that Jesus had been rescued alive from the cross; that the "report" of Jesus being the risen John the Baptist (Mark 6:14) was a Christian attempt to undercut John's sect's own resurrection preaching. At a number of other points, Loisy anticipated the theories of later scholars who got credit for them instead.

All in all, Loisy was the ideal scholar of Christian origins by Renan's standard: one who had once believed in the religion (and hence was able to understand it from the inside) and who no longer believed in it (and hence was able to understand it from the outside). He died in 1919.

ROBERT M. PRICE

LOKOYATA. See **CARVAKA.**

LORULOT, ANDRÉ (1885–1963), French freethinker, anticlerical, and anarchist. André Lorulot was born October 23, 1885. During much of his anarchist career he was known as André Georges Roulot. While still a young man, Lorulot turned to anarchism (see ANARCHISM AND UNBELIEF). He was influenced in particular by the charismatic one-legged revolutionary Albert Joseph, who was known as Libertad. In 1905 Lorulot began writing in Libertad's journal *L'anarchie* (Anarchy). The following year, along with his girlfriend, Emilie Lamotte, Lorulot joined the libertarian commune at St. Germain en Laye. While living there Lorulot wrote the pamphlet *L'idole, patrie at conséquence*, which provoked a charge of inciting soldiers to disobedience. When he emerged from his fifteen-month prison sentence, the St. Germain en Laye commune had folded and Libertad was dead. Lorulot took over control of *L'anarchie* paper and also began *L'idée libre*, a review.

Lorulot spent much of World War I in prison as a pacifist. After the Bolshevik revolution he moved from anarchism to communism. It was at this point that he became an active freethinker. During his imprisonment Lorulot wrote lengthy memoirs, among which appeared the observation: "Man: a species of ape who believes in the gods and who imitates them without ceasing to be an animal."

Lorulot's FREETHOUGHT was peppered with a strong strain of ANTICLERICALISM. During the 1956 Hungarian uprising he wrote, "A criterion (that has never yet failed me!) is 'Distrust everything that comes from Rome.'" Taking the Soviet side, Lorulot saw the uprising as a Catholic-inspired white reactionary movement, and condemned it accordingly. He was at this time vice president of the World Union of Freethinkers. In 1958 he became the organization's president, continuing the pro-Communist stance the WUF had taken since the mid-1930s. Lorulot died on March 11, 1963.

BILL COOKE

LUCRETIUS, TITUS CARUS (99–55 BCE), Roman philosopher and poet. Aside from his authorship of *De Rerum Natura* (On the Nature of Things), little is known of Lucretius. He apparently came from an obscure branch of an ancient family and was well educated. *De Rerum Natura* is an exposition in Latin hexameters of the metaphysical system of EPICURUS, only a miniscule portion of whose work survives. Lucretius transformed the workaday prose of the Greek philosopher into sterling poetry.

The Epicurean Gods. The Epicurean gods dwelled between worlds, ensconced in a Shangri-la of blissful stasis. They did not create the universe, stage-manage events, answer prayers, reward virtue, punish vice, inspire sacred texts, impregnate mortals, or traverse the cosmos. They were limited in knowledge, power, and inventiveness. Whether Lucretius believed these gods existed or was merely deferring to Epicurus is problematical.

Misconceptions about the Gods. Lucretius scoffed at

the notion that the gods created the earth for humans. The terrain and climate were inhospitable to creatures of our kind, much of the land barred to mortals by scorching heat and biting cold. Moreover, the gods had no incentive to create humans: "What largess of beneficence could our gratitude bestow upon beings immortal and blessed that they should do anything for our sake?" Nor would the gods necessarily confer a benefice by creating us: "He who has never tasted the love of life, never been enrolled in the lists, how does it hurt him never to have been made?"

For Lucretius, fear of the gods was held irrational. Nature is a law unto herself. Humans need not worry that capricious gods will undo the orderly motions of the heavens. Nor should we fear that the gods will punish us either here or hereafter. Such beliefs generate needless fear of death and natural phenomena. The underworld is a fiendish projection of earthly travails. Fear of death also results from misapprehensions about eternal oblivion. When people picture themselves dead, they imagine they will retain bodily sensations. They think they will miss life's pleasures, forgetting that "no longer will any desires possess them."

Materialism. Lucretius embraced a mechanistic universe. Everything in it, including events called mental, is a manifestation of the interaction of particles (see MATERIALISM, PHILOSOPHICAL). Ultimately, nothing exists but atoms and the void (*corpora et inane*). There is no ghost in the machine. Just as the letters of an alphabet can be variously ordered to create an infinite number of words, so diverse combinations of atoms produce an inexhaustible supply of entities. The movement of the atoms is fortuitous, undirected, without behest. Creator or designer gods are an unnecessary hypothesis.

Lucretius held that belief in providential deities stems from ignorance and indolence. By treating gods as the causal agents of natural processes, people avoid the labor of seeking the real causes. The ascription of causal efficacy to the gods is a mistake for which humans pay dearly: "What groans did we create for ourselves, what wounds, what tears for generations to come!" True piety, according to Lucretius, consists in the ability "to survey all things with tranquil mind." Observe closely and reason carefully, he advised. Be prepared to abandon entrenched suppositions and to adopt new premises: "Ponder everything with keen judgment; and if it seems true, own yourself vanquished, but, if it is false, gird up your loins to fight."

Legacy. Lucretius has inspired many writers. Echoes of *De Rerum Natura* can be found in Virgil, Ovid, William Shakespeare (see SHAKESPEARE, RELIGIOUS SKEPTICISM IN), John Milton, William Wordsworth, Matthew ARNOLD, Alfred, Lord Tennyson, and other luminous legatees. Lucretius's conviction that the cosmos can be understood without appeal to supernatural agencies led to the suppression of *De Rerum* in the Middle Ages.

GARY SLOAN

MACDONALD, GEORGE EVERETT HUSSEY (1857–1937), American freethinker and journalist. George Macdonald was born in modest circumstances in Gardiner, Maine. Macdonald's father was killed at the age of thirty-six in the second battle of Bull Run in August 1861. His mother, Asenath (*née* Hussey), was from a Maine Quaker family. Later in life Macdonald dropped his third initial, not because of any discord with his mother, but rather because of his horror at the tedium of Quaker lives, which he recalled as "so dreary that I have been under the depression of it ever since."

Macdonald began his working life as a farm hand, but soon moved to New York City, where he took up work as a printer's devil for the newly established freethought paper *THE TRUTH SEEKER*. This paper was to determine his life and shape his attitudes. Macdonald had not been in New York long when *The Truth Seeker*'s founder and editor, D. M. BENNETT, went to prison for thirteen months for supposedly sending "obscene" material through the mail. Bennett was prosecuted under the notorious Comstock Laws (see COMSTOCK, ANTHONY, AND UNBELIEF). A petition bearing two hundred thousand signatures was insufficient to secure Bennett's release.

Macdonald stepped in as editor, and *The Truth Seeker* survived Bennett's imprisonment. Macdonald continued to work for the paper until 1888, when, with his friend Samuel Porter PUTNAM, he went to San Francisco and founded the journal *Freethought*. In that year he also married Grace Leland, daughter of the radical Mary Chilton. The couple had two sons, Eugene Leland and Putnam Foote Macdonald. After *Freethought* folded in 1891, Macdonald went north to Snohomish, Washington, where he worked for the town's paper, the *Eye*. In 1893 Macdonald returned to New York and resumed his connection with *The Truth Seeker*. He remained with the paper for the rest of his life.

In 1909 he took over the editorship of *The Truth Seeker* after his brother, Eugene Montague Macdonald, who had edited the paper since 1883, died of tuberculosis. Macdonald remained the editor of *The Truth Seeker* until his death in 1937. Macdonald shares with Chapman COHEN of Great Britain and James O. HANLON of New Zealand the distinction of being one of the longest-standing editors of a freethought magazine.

As well as his prodigious writing load for *The Truth Seeker*, Macdonald wrote a history of the Inquisition titled *Thumbscrew and Rack: Torture Implements Employed in the XVth and XVIth Centuries* (1904). Beginning in 1923, he set himself the task of writing a history of the American freethought movement over the half century of his involvement. *Fifty Years of Freethought* came out in two volumes, the first in 1929 and the second in 1931. He had a delightful writing style: candid and self-deprecatory, but also principled. *Fifty Years of Freethought* remains an invaluable history of freethought and an incisive memoir of American life in the nineteenth century. Macdonald was also instrumental in gathering together the material and compiling the index for the Dresden Edition of the works of Robert G. INGERSOLL, published by C. P. FARRELL.

Taking the lead from Putnam, Macdonald's FREETHOUGHT was liberal, with a high level of confidence in progress. Macdonald took a phrase from the *First Principles* (1862) of Herbert SPENCER, his favorite philosopher, and used it almost as a creed: "Not adventitious therefore will the wise man regard the faith which is in him. The highest truth he sees he will fearlessly utter; knowing that, let what may come of it, he is thus playing his right part in the world."

BILL COOKE

MACKIE, J. L. (1917–1981), English philosopher. John Leslie Mackie is one of the best-known atheistic philosophers of the second half of the twentieth century. Mackie hailed from Sydney, Australia, but spent the last—and most productive—part of his career as a fellow of University College, Oxford.

Mackie's reputation in philosophy of religion derives mainly from two works: "Evil and Omnipotence" (1955), an early article defending a logical argument from evil (see EVIL, PROBLEM OF; EXISTENCE OF GOD, ARGUMENTS FOR AND AGAINST), and *The Miracle of Theism* (1982), a posthumous book that provides a systematic defense of atheism. Both of these works provoked extensive subsequent discussion.

While many theistic philosophers now claim that Mackie's logical argument from evil has been demolished, principally by the work of Alvin PLANTINGA, many atheistic philosophers view matters in a different light. In Mackie's view, if there were an omnipotent, omniscient, and perfectly good creator of the universe, such a being would have made a universe in which there is no moral evil, that is, a universe in which everyone always freely chooses the good. Since it is plain that there is moral evil—it is plain that not everyone always freely chooses the good—it follows that there is no omnipotent, omniscient, and perfectly good creator of the universe. The main difficulty with this argument is that it is not clear that it is possible for beings to be made such that they all always freely choose the good. If beings are made such that they all always choose in a certain way, how can it be that the choices of those beings are genuinely free? Mackie assumed—and believed—that freedom is compatible with DETERMINISM; not all philosophers agree with him on this point.

On the other hand, there is much nearer to universal agreement—among theistic and atheistic philosophers alike—that *The Miracle of Theism* is among the very best works that have been produced by atheistic philosophers of religion. It contains penetrating discussions of ontological arguments, cosmological arguments, arguments from design, moral arguments, arguments from consciousness, arguments from miracles and testimony (see MIRACLES, UNBELIEF IN), arguments from religious experience, arguments from evil, arguments from natural histories of religion, PASCAL'S WAGER, and the relationship between belief and reason. Mackie's conclusion is that "the balance of probabilities comes out strongly against the existence of a god," that is, against the existence of a supernatural creator of our universe.

Mackie made important contributions to other areas of philosophy that bear on his views in philosophy of religion. Most famously, Mackie defended the metaethical view that there are no objective moral values. This defense is recorded in his book *Ethics: Inventing Right and Wrong* (1977). Mackie also wrote extensively about the analysis of causation—see, for example, *The Cement of the Universe: A Study of Causation* (1974)—and about significant figures in the history of philosophy, as in *Problems from Locke* (1974) and *Hume's Moral Theory* (1980).

GRAHAM OPPY

MADISON, JAMES (1751–1836), American politician, political philosopher, civil libertarian, and champion of religious liberty and church-state separation. After completing his studies at Princeton, James Madison spent the rest of his life involved in politics. He served in the Virginia General Assembly, the Virginia Revolutionary Convention, the United States Congress, as a delegate to the Constitutional Convention in 1787, as an adviser to Pres-

ident George Washington, as secretary of state under President Thomas JEFFERSON, and president for two terms, from 1809 to 1817. He was also coauthor of the Federalist Papers with Alexander Hamilton and John Jay.

Madison is regarded as the most important figure in the development of religious liberty and church-state separation, as the chief architect of the Constitution and Bill of Rights, and as the cofounder, with Jefferson, of what is now the Democratic Party.

Madison, Religion, and Religious Liberty. Very little is known about Madison's personal views on religion, though he was at least a nominal Episcopalian all his life. Indeed, his cousin and friend of the same name was an Episcopal bishop. He did his university work at Princeton (then the College of New Jersey), a Presbyterian institution, where he was greatly influenced by Scottish professor John Witherspoon, later one of the signers of the Declaration of Independence. Princeton's goal then was "to cherish the spirit of liberty and free enquiry."

Madison, who studied theology at Princeton, was possibly a Deist like Benjamin FRANKLIN, Jefferson, and Thomas PAINE. He wrote at one point that belief in an all-powerful, all-wise deity "is essential to the moral order of the world and the happiness of man," but declined to express any opinion about the nature of the deity. He kept his religious opinions to himself, perhaps because he knew well of the negative reactions to Ethan ALLEN's *Reason, the Only Oracle of Man* and Paine's *Age of Reason*, and the bitter attacks on Jefferson in the 1800 election campaign. Probably, like Franklin, he knew that involvement in religious disputes would interfere with his goal of promoting religious liberty and church-state separation.

As early as 1774, at the age of only twenty-two, Madison wrote to his Philadelphia college friend William Bradford Jr., complaining of his Virginia neighbors indulging in the "diabolical, hell-conceived principle of persecution." As historian Edwin Gaustad points out, "By jailing half a dozen well-meaning men [Baptist preachers] for merely proclaiming their religious positions, Madison's neighbors unwittingly launched a career committed to liberty in religion. It was his very first libertarian concern; it was to be his last."

Madison wrote to Bradford again in 1774 comparing "the liberality of Pennsylvania with the intolerance of Virginia." He wrote, "Religious bondage shackles and debilitates the mind and unfits it for every noble enterprise, every expanded prospect."

At the Virginia Revolutionary Convention in 1778, Madison and George Mason succeeded in injecting the following provision into the state constitution: "That religion, or the duty which we owe to our Creator, and the manner of discharging it, can be directed only by reason and conviction, not by force or violence; and therefore, all men are equally entitled to the free exercise of religion according to the dictates of conscience." Mason's original bill had provided for "the fullest Toleration in the Exercise of Religion," but Madison improved it by changing "toleration" to "free exercise," a phrase that turned up later in the First Amendment. Thus began the years-long struggle to completely separate church and state. The next item of business was to eliminate compulsory support of churches in Virginia, which was temporarily halted in 1779. In 1784, however, the legislature called up a bill to provide tax support for "Teachers of the Christian Religion." Madison led the opposition to the bill, which had considerable support from the Episcopal clergy, though opposed by Baptists, Presbyterians, and others.

As historian Robert Alley shows, Madison, fearing that the "general assessment" bill might be passed, developed a shrewd strategy for its defeat. First he arranged that the legislature would postpone action until late 1785. Then he supported the election of Patrick Henry to the governorship, removing Henry from the legislature, where his eloquence had exerted a powerful influence in favor of tax aid to religion. Finally he wrote and widely circulated his "Memorial and Remonstrance against Religious Assessments." This document has been heralded by historian Elwyn Smith as "the premier public document of American church-state thought" and by the twentieth-century church-state activist lawyer Leo PFEFFER as "one of the great documents in the history of human liberty" which "should be required reading in every American school." Madison biographer Irving Brant writes, "The remonstrance against religious assessments continues to stand, not merely through the years but through the centuries, as the most powerful defense of religious liberty ever written in America," while Canon Anson Phelps Stokes considered it "one of the truly epoch-making documents in the history of American church-state separation; as impressive and convincing today as it was over a century and a half ago."

The Memorial and Remonstrance (readily available from many sources) eloquently spells out fifteen reasons why any tax aid (even "three pence only") for the support of religion would be harmful to religion, government, and individual rights. The Memorial was persuasive; the religious assessments bill was defeated. This in turn paved the way for passage of Jefferson's Statute for Establishing Religious Freedom in 1786.

In 1787 the Constitutional Convention met in Philadelphia to produce the framework of government that continues to serve. Unlike the Declaration of Independence, it contains no reference to a deity. The Declaration stated that "all Men are created equal [and] are endowed by their Creator with certain unalienable Rights, . . . That to secure these Rights, Governments are instituted among Men, deriving their just Powers from the Consent of the Governed." In 1776 this country was more or less evenly divided among those supportive of, opposed to, or indifferent about the Revolution. The rather disorganized Americans were up against the nation with the best army and navy in the world, a nation, like most in Europe, that supported the notion of

the "divine right of kings." How better to counter the "divine right of kings" than with the "divine rights of the people"—though as frequently noted, in its invocation of the creator and "nature's God" the Declaration uses language more characteristic of DEISM than Christianity.

By 1787, however, the Revolution was receding into the past and the outdated Articles of Confederation had to be completely revised. Reference to a deity in the new Constitution was no longer considered necessary. Following the lead of the Declaration, the new document began/begins: "We the People of the United States, in Order to . . . do ordain and establish this Constitution for the United States of America."

Madison, justly regarded as the "Father of the Constitution," guided the process through to completion. The only references to religion in the charter, found in Article VI, were/are the bans on mandatory oaths of office and religious tests for public office.

Once completed, the Constitution had to be ratified by the states, a process that threatened to stall because of the absence of a bill of rights. Jefferson, in Paris as American ambassador, made this point in a communication to Madison. At the end of the day Madison and other leaders promised to add a bill of rights. The Constitution was ratified and the first Congress set to work on twelve, later reduced to ten, amendments, which in turn were ratified.

Again, Madison was the main architect of the Bill of Rights. The First Amendment, which is of paramount importance in America today, stipulates that "Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof." In 1802 President Jefferson, in a letter to the Baptists of Danbury, Connecticut—a letter cleared through his attorney general, Levi Lincoln—declared that the amendment built "a wall of separation between church and state." In 1879 in *Reynolds v. United States* (98 U.S. 145) the Supreme Court cited Madison's Memorial and Remonstrance and Jefferson's letter to the Danbury Baptists, traced the history of church-state relations, and concluded that Jefferson's "wall" metaphor "may be accepted almost as an authoritative declaration of the scope and effect of the amendment." This view in turn was accepted, developed, and amplified by a unanimous Supreme Court in 1947 in *Everson v. Board of Education*.

Parenthetically it might be noted that Madison wanted the Bill of Rights to apply to the states as well. This view was rejected because of the belief, which proved mistaken, that the state governments offered adequate protection. It was not until after the Civil War that the Fourteenth Amendment was added to the Constitution to make the Bill of Rights applicable to state and local government, a view the Supreme Court began to apply piecemeal only after World War I.

The significance of the pioneering work of Madison, Jefferson, and their colleagues is of great importance today, given the Supreme Court's drift away from the separationist position of the *Everson* Court in 1947 and its rulings for a third of a century thereafter. This drift is well focused in Chief Justice William Rehnquist's long dissent in *Wallace v. Jaffree* (1985), in which he wrote that Jefferson's "wall of separation between church and state" is "a metaphor based in bad history, a metaphor which has proved useless as a guide to judging." (An examination of the three dozen Supreme Court rulings on religious liberty, church-state issues, and reproductive freedom of conscience in which Rehnquist participated through June 4, 2005, shows that he came down on the side opposed to separation and freedom of conscience 90 percent of the time.)

Who is right, then, about the meaning or "original intent" of the First Amendment: "accommodationists" from Patrick Henry to justices William Rehnquist, Antonin Scalia, and Clarence Thomas, or the "separationists" from Madison and Jefferson to majorities of the Supreme Court justices from 1947 to about 1990? The historical record favors the separationists.

Between June 7 and September 25, 1789, Congress deliberated over how to shape the religious freedom clause of the First Amendment, considering no fewer than ten different versions before arriving at the one agreed upon by the House-Senate conference committee and then approved by both houses of Congress. One thing is clear: The framers of the First Amendment were not concerned about preventing a single national religious establishment, as in Britain, but about whether to have "accommodationist" language that would permit multiple establishments. By 1789 there was no single religious establishment in any state and multiple establishments in only a few.

The story of the separation legacy of Madison, Jefferson, and the other Founders is still evolving in ways whose end cannot be predicted.

Religious liberty and church-state separation remained among Madison's central concerns. In 1785 he opposed a proposal that Congress set aside one section of each township in the Northwest Territory for the support of religion; by 1787 the Northwest Ordinance was passed, stripped of any mention of aid to religion. In 1790 Madison successfully opposed using questions about religion in the first United States census.

As president from 1809—the year in which both Abraham Lincoln and Charles DARWIN were born—to 1817, Madison continued to defend the separation principle, vetoing bills to incorporate the Episcopal Church in Alexandria, Virginia, and the District of Columbia (he feared that incorporation would stimulate a dangerous accumulation of land and wealth by churches) and a bill to grant a small parcel of land to a Baptist church in the Mississippi Territory. Of course the War of 1812 kept Madison busy for several years, but its conclusion guaranteed the young country's survival.

The Virginian's interest in religious liberty continued after he left the White House. In a letter to Robert Walsh in 1819 he declared that "the number, the industry, and the morality of the Priesthood, & the devotion of the

people have been manifestly increased by the total separation of the Church from the State." In 1822 he wrote to Edward Livingston that governments "do better without Kings & Nobles" and that "Religion flourishes in greater purity, without than with the aid of Gov[ernmen]t."

Between 1817 and 1832 Madison wrote a series of observations on various topics. These notes were only discovered in 1946 among the papers of Madison biographer William Cabell Rives. They were published by Elizabeth Fleet in the *William and Mary Quarterly* that same year as the "Detached Memoranda." The "Memoranda" clearly show the strong positions he continued to hold until the end of his life. He elaborated on "The danger of silent accumulations & encroachments by Ecclesiastical Bodies [not having] sufficiently engaged attention in the U.S. . . . are the U.S. duly awake to the tendency of the precedents they are establishing, in the multiplied incorporations of Religious Congregations with the faculty of acquiring & holding property real as well as personal?" He went on to oppose grants of public land to churches, tax exemption of religious entities, mention of the deity in government documents, congressional chaplaincies ("a palpable violation of equal rights, as well as of Constitutional principles"), and religious proclamations by government.

Madison was not hostile to religion, though often critical of abuses by religion. His consuming lifetime interest was in defending freedom of *and* from religion to the maximum extent possible through total separation of church and state.

Though of small stature—Washington and Jefferson towered over him—and with a soft speaking voice, Madison made himself into one of the most important figures in the development of democracy and human rights. As historian William Lee Miller put it: "John Marshall, the future chief justice, who was usually an opponent of Madison's, nevertheless said of him that if eloquence included 'persuasion by convincing, Mr. Madison was the most eloquent man I ever heard.' He persuaded by his thorough preparation, his layers of reading, his logical powers; he made his mark not by his tongue or his throat, or by his presence, but by his pen and his brain and his diligence."

EDD DOERR

MALRAUX, ANDRÉ (1901–1976), French novelist and activist. A man of many talents and indefatigable energy, André Malraux distinguished himself first and foremost as a writer, but also as a soldier, art critic, and eventually minister of culture under Charles de Gaulle. He was born into a modest family that had been established for generations in the port town of Dunkirk on the north coast of France. He challenged convention from the outset; though obviously gifted intellectually, he decided to abandon formal schooling at the age of seventeen, and the restless spirit of the autodidact was to mark his work thereafter. While still a teenager he persuaded a seller of rare books and prints to recruit him as an employee. Malraux's prodigious intellectual appetites and boundless self-confidence ignited his passion for art, and he soon propelled himself into the orbit of figures at the cutting edge of modern art. Becoming friends and not just clients, artists like Georges Braque and Fernand Léger even agreed to provide illustrations for Malraux's first foray as a published author.

Malraux was already an established author by the time he reached his late twenties and his greatest novelistic achievements appeared within the space of a decade: *Les Conquérants* (The Conquerors, 1928), *La Condition Humaine* (Man's Fate, 1933), and *L'Espoir* (Days of Hope, 1937). His description by some critics as a "pre-existentialist" stems from the fact that one of the themes running through all his novels is the challenge faced by the individual attempting to leave his or her mark on a world apparently devoid of enduring values. In the imaginary

exchange of philosophical letters between a European and an Oriental, which he published in 1926 under the title *La Tentation de l'Occident* (The Temptation of the West), the French correspondent argues that the West has burned its old gods only to find itself facing the abyss of an existence without meaning. What the chief protagonists attempt to establish in his subsequent novels are ways of asserting those fraternal values that defend the dignity of humanity in an indifferent world often convulsed by conflict and pointless brutality. Malraux's reputation as a defender of humanist values was further enhanced by his support of the democratic cause during the civil war in Spain, where he served as a fighter pilot and helped organize the aerial battle against Gen. Francisco Franco and his fascist allies. After France was pulled into the global conflict against fascism, Malraux served with distinction in the Free French Forces that had rallied around Charles de Gaulle, and he eventually played an active part in the campaign by those forces, following the successful Allied landing on D-day, that succeeded in expelling German troops from eastern France, thereby finally liberating the country.

In common with many intellectuals during the 1930s, Malraux sympathized with the humanist ideals of MARXISM and supported the Soviet Union as a necessary counterweight to the manifest inhumanity of Nazism. But disillusionment soon set in after the end of World War II, when the truth concerning the systematic brutality of Joseph Stalin's Communist regime in the Soviet Union began to emerge. Drawing ferocious criticism from former left-wing allies, Malraux decided to offer his political allegiance to de Gaulle and ultimately became a very high-profile minister of culture in his administration following the establishment of the Fifth Republic in France in 1958. Malraux's novel writing came to an end in the 1950s; his intellectual energies were increasingly invested in art. Works such as *Les Voix du Silence* (The Voice of Silence, 1951) and *Le Miroir des Limbes* (Anti-memoirs, 1976) expressed a sensibility that was turning away from political engagement in pursuit of humanist values, toward a belief in the redemptive possibilities offered by artistic creation and in particular the potential for art to communicate, from one generation to the next, the enduring vision that allows us to humanize the world. Malraux's writing on art was not without its critics, but there was more positive agreement concerning his efforts as a government minister to democratize the enjoyment of culture during the 1960s by initiating the creation of a regional network of *Maisons de la culture*. Malraux's reputation was revived in the 1990s, and in 1996 his remains were transferred to the Pantheon in Paris, to rest alongside the other illustrious proponents of the French Republic's humanist values.

GINO RAYMOND

MANDEVILLE, BERNARD DE (1670–1733), Dutch philosopher. Born in Holland, Bernard de Mandeville was educated at the Erasmian school in Rotterdam and at the University of Leiden, where he studied medicine and philosophy. He specialized in nervous disorders but showed an early literary bent, being well read in French skeptical literature by the time he was at university.

His family were respectable bourgeois folk, many of whom had been medical doctors. But it is possible that the young Mandeville was involved in the Costerman Riots in Rotterdam in 1690. At any rate, he emigrated to England in the following year, settling down into a good practice with well-to-do clients and marrying an English lady, Ruth Elizabeth Laurence.

The successful doctor (who counted the eminent Sir Hans Sloane among his friends, and who met Benjamin FRANKLIN while the latter was in London) turned his attention to literary matters, producing "The Grumbling Hive or Knaves Turned Honest," a doggerel poem that formed the kernel of his magnum opus, *The Fable of the Bees*. This was published in two parts, first in 1714 and then in 1729. Mandeville's *Fable* is an extended essay of a philosophical, sociological, economic, and political character that advances a Hobbesian theory of human nature and an economic theory of social mechanism which anticipates Adam Smith's "Invisible Hand." In a paradoxical flourish, Mandeville defends luxury, whatever its moral effect, as an agent of prosperity and employment in modern commercial society. The book became notorious in 1723 when Mandeville appended an essay on charity schools attacking the usefulness of educating the "labouring poor." To its author's delight, the *Fable* was condemned by the Grand Jury of Middlesex and burned at Tyburn by the public hangman, ensuring wide publicity for several generations.

Mandeville wrote a number of other works, on prostitution, women's rights, hanging, and (adding to his reputation as an unbeliever) a book suggesting that Christianity did good when harnessed to war. But *The Fable of the Bees*, with its paradoxical subtitle, "Private Vices, Public Benefits," remained his most celebrated work and attracted the attention of generations of clerics and philosophers (Bishop Joseph Butler, Bishop George

Berkeley, David HUME, Smith, and VOLTAIRE, to name only some) who held him to be a true unbeliever.

MALCOLM JACK

MARÉCHAL, PIERRE-SYLVAIN (1750–1803), French revolutionary and atheist. Sylvain Maréchal, as he is often called, was one of the most prominent of the militant atheists who flourished in France during the eighteenth century. While he is perhaps less celebrated than figures such as Julien Offray de LA METTRIE and Baron d'HOLBACH, his ferocious hostility to religious belief of any kind is as intense as anything to be found in their writings. Yet he was not content simply to oppose the church, for he combined his atheism with a strong commitment to social change and eventually became not so much an atheist as an anarchist. These uncompromising views were not, however, instinctive. Born the son of a wine merchant in Paris, he trained as a lawyer. His earliest publications were poems of a conventional, pastoral kind, which impressed contemporaries enough to earn him a position in 1770 as sublibrarian at the Bibliothèque Mazarine in his native city, a post which he held for some fifteen years. His position gave him the leisure and the opportunity to read widely, and he rapidly became a disciple of writers such as Jean-Jacques ROUSSEAU and Etienne-Garbriel Morelly, who deplored the gross inequalities created by the pursuit of wealth. Like Morelly in particular, Maréchal advocated as a remedy for these ills a return to a form of simple agrarian communism, a doctrine which he set out in *Le Livre de tous les âges* (The Book of All the Ages, 1779). He then concluded that social revolution could not be effective without the abolition of organized religion, a case argued in two anonymous works, the *Fragmens d'un poème moral sur Dieu* (Fragments of a Moral Poem on God, 1780) and the *Livre échappé au déluge* (The Book Which Escaped the Flood, 1784), the second of which he apparently printed himself. Having been dismissed from his post for his views, Maréchal was by now notorious enough to be regarded (perhaps wrongly) as the author of an *Almanach des honnêtes gens* (The Good People's Almanack, 1788), a sort of humanist calendar in which the names of saints were replaced by those of the "benefactors of humanity." Imprisoned for three months in Saint-Lazare for his alleged audacity, Maréchal published most of his later writings anonymously. During the French Revolution, he lived by producing potboilers of various kinds, including a history of costume. His main role, however, was to use his position as editor of the widely read periodical *Révolutions de Paris* to advocate his increasingly ferocious antiroyalist and antireligious opinions. His experience of the factional infighting into which the Revolution descended disillusioned him with all organized political structures, as he showed in his *Manifeste des Egaux* (Manifesto of the Equals, 1794), which advocated a wholly egalitarian society. The views to which he clung for much of his life were encapsulated in his last significant work, the *Dictionnaire des Athées* (Dictionary of Atheists) of 1800. While he wrote copiously on a variety of subjects, Maréchal is perhaps best remembered today for his play *Le Jugement dernier des rois* (The Final Judgment of Kings, 1793), a striking (not to say murderous) one-act "prophecy" in which the crowned heads of Europe, deposed by popular uprisings, are taken to a tropical island; having reluctantly confessed their crimes, they are left to perish in a spectacular volcanic eruption.

DAVID ADAMS

MARTIN, EMMA (1812–1851), English FREETHOUGHT pioneer. Brought up in a strict Baptist family from Bristol, Emma Martin quickly revealed unusual intellect. At the age of twenty-four, she was editor of the *Bristol Magazine*. Initially a fervent Christian, Martin began her career as a critic of infidelity, denouncing it as an effusion of weak minds and the resource of guilty ones. She lost her faith after a long period of study and thought, brought on by the trials for BLASPHEMY of George Jacob HOLYOAKE and Charles SOUTHWELL. She also had to struggle with a desperately unhappy marriage, eventually having to maintain her children on her own, something nineteenth-century England made formidably difficult for women.

Martin became a prominent exponent of women's rights (see WOMAN SUFFRAGE MOVEMENT AND UNBE-

LIEF) and of freethought. Fluent in Italian, she also translated the *Maxims* of Guicciardini into English. Martin also penned several short tracts, including *Baptism a Pagan Rite* (1843), *Religion Superseded*, *Prayer*, *A Conversation on the Being of God*, and a protest against capital punishment. She also wrote a novel called *The Exiles of Piedmont*. And in order to make a living for herself and her children, Martin trained as a "physician for women."

Emma Martin was struck down in her prime, dying of consumption at her home in London in October 1851, aged only thirty-nine. George Jacob Holyoake, who spoke at her funeral, described Emma Martin as "a handsome woman, of brilliant talent and courage."

BILL COOKE

MARTINEAU, HARRIET (1802–1876), English author and freethinker. Harriet Martineau, one of the first practitioners of sociology, was a significant role model as a nineteenth-century female author who supported herself with her writings, signing her own name. Martineau was born a Unitarian but noted in her autobiography, "I disclaim their theology *in toto*." Sixth of eight children of a silk manufacturer in Norwich, England, Martineau was a sensitive child whose first inner rebellion was at chapel. She grew quite deaf by the age of twelve, and became devoutly religious. Martineau's first book was *Devotions for Young People* (1823). Her monthly tracts on political and economic issues made her sought after as a writer. She toured America for two years in her early thirties, writing the two-volume *Society in America* (1837), as acclaimed a work in its day as Alexis de Tocqueville's study. She felt American women had an unhealthy obsession with religion. After Martineau endorsed freethinking abolitionist William Lloyd Garrison, she spent the final three months of her tour being mobbed by opponents.

Among her series of essays and books is *The Hour and the Man* (1841), a tribute to Haitian revolutionary Toussaint L'Ouverture. After overcoming a period of invalidism, Martineau visited Egypt, Palestine, and Arabia in 1846, writing *Eastern Life, Past and Present* (1848), which examined the genealogy of the various faiths. A collection of letters she exchanged with H. G. Atkinson, *On the Laws of Man's Nature and Development* (1849), made clear her freethought views: "There is no theory of a God, of an author of Nature, of an origin of the Universe, which is not utterly repugnant to my faculties; which is not (to my feelings) so irrelevant as to make me blush; so misleading as to make me mourn."

Wanting to write a book for "the Secularist order of parents," she produced *Household Education* (1848). Martineau translated and condensed the six volumes of French atheist and philosopher Auguste COMTE into two volumes, with his approval, in 1853. She wrote fifty books, nearly all nonfiction, and more than sixteen hundred articles.

Mistakenly diagnosed with fatal heart disease in 1855, Martineau wrote her autobiography, but lived until 1876. In this two-volume work she candidly recorded her rejection of "the superstitions of the Christian mythology." After her death Garrison praised her service to abolition. On September 29, 1867, Florence Nightingale wrote that Harriet Martineau "was born to be a destroyer of slavery, in whatever form, in whatever place."

ANNIE LAURIE GAYLOR

MARXISM. Early Marxism, or "scientific socialism," held a number of characteristic positions on religion: (1) religion, usually equated with the Abrahamic faiths, has been shown to be false by the advances of science; (2) religion, like all false ideas, is a distorted reflection of reality in the human mind; (3) religion is an imaginary compensation and solace for people's dissatisfaction with existing conditions; (4) religion changes as social conditions change (the rise of Protestantism, for example, corresponding to the rise of bourgeois social relations of market exchange); (5) the state should regard each person's religion as "a private matter," and not discriminate on grounds of religious practice or affiliation; (6) religion is generally an instrument of class oppression, but some past episodes, such as the rise of the early Christian church and medieval peasant revolts, show religion at the service of oppressed classes; and (7) with the coming of socialism, but not before, religion will spontaneously disappear.

These positions have continued to characterize most Marxist thought, though they have been qualified and emphasized in a variety of ways and occasionally called into question. They are related to the Marxist theory of historical materialism, which declares that the social relations of production are the "base" of society, on which rests a dependent "superstructure" that includes

religion as well as philosophy and law. The claims of historical materialism are famously ambiguous—and, contrary to a widespread supposition, historical materialism, as a theory about social processes, is independent of the question of theism or any other religious tenet (see ATHEISM). The materialist claim that mental or "spiritual" activities exist as a by-product of particular arrangements of matter (see MATERIALISM, PHILOSOPHICAL) neither implies nor is implied by the twin historical-materialist contentions (1) that the general character of a whole society is determined by its social relations of production and (2) that changes in the social relations of production occur in response to changes in the forces of production (roughly, technology).

Marxism embraces materialism in both senses; its opposition to religion is an aspect of its opposition to philosphical idealism. Dialectical materialism ("diamat") is a narrower doctrine, possibly not held by Karl MARX, but derived from Friedrich Engels, Plekhanov, and Vladimir Ilyich LENIN. It maintains that various processes of thought (most famously the negation of the negation, the transformation of quantity into quality, and the Fichtean triad of thesis-antithesis-synthesis) identified by idealists like G. W. FICHTE and G. W. F. Hegel as processes in the world of thought should properly be attributed to events in the physical world. Dialectical materialism, like Lysenkoist biology but unlike historical materialism, has drawn virtually no respect from scholars other than committed Marxists.

In the fin de siècle and the early twentieth century, there was much discussion of the attitude Marxist parties should take to workers who sympathized politically with socialism while believing in Christianity. The predominant view, with many variations of detail, was that scientific socialists should seek the political support of religious proletarians while continuing to promulgate materialism and atheism. The opinion, held by the French socialist leader Jean Jaurès and the Austro-Marxist Max Adler, that religious belief is fully compatible with scientific socialism, has always remained extremely rare.

Pre-Bolshevik Marxism was open to new ideas from non-Marxist thinkers about the origin and social function of religion. The theories of writers like Herbert SPENCER, Ernest HAECKEL, Tylor, and Max Müller were readily absorbed. Heinrich Cunow's 1913 work drew upon such theoretical developments to criticize the earlier Marxist view that religion arose from ignorance of natural forces, advancing instead the theory, evidently more compatible with historical materialism, that the origin of religion lay in the social structure.

Before 1914 the world center of Marxism was Germany, where the leading Socialist Party theoretician, Karl Kautsky, was dubbed "the Pope of Marxism." Kautsky contended that early Christianity had not been primarily a slave movement, as Engels had maintained, but a proletarian movement, and that Jesus was crucified for violent rebellion against the ruling class. (Strong interest in the early Christian church, and awareness of similarities between that phase of history and modern socialism, has been a recurring feature of Marxism, uniting such diverse figures as Sorel and Antonio Gramsci.) Although, in line with Engels, Kautsky tried to show the derivation of religious developments from economic causes, his thinking became gradually more subtle, and in his *The Materialist Conception of History* (1927) he depicted religious belief as social morality objectified in the form of "collective representation."

With the formation of the Comintern in 1920, Moscow became the recognized center of Marxism. The Russians had been among the more zealously antireligious Marxists (see PROPAGANDA, ANTIRELIGIOUS [SOVIET]). The Soviet government pursued a strongly antireligious policy, with occasional vacillations and concessions. This policy had three components: persecution of religious activities (denial of civil rights to active theists), propaganda for atheism, and the attempted creation of a puppet church under government control. The official theory was that there was freedom of religion in the Soviet Union, because the antireligious activities were carried out by the Communist Party, not the state. But this distinction was inconsequential in practice because the Party was merely an instrument of the state. The traditional Marxist positions, that the state should not curtail religious freedom and that the Marxist party should vigorously oppose religion, took on a different complexion when the Marxist party was the sole legal political movement—something that Marxists before 1917 had not anticipated.

In January 1918 Patriarch Tikhon denounced the Bolshevik government for its brutality, and the Bolsheviks reacted by killing thousands of Orthodox clergy and laypeople, arresting thousands more, seizing all church assets, and forbidding churches to own property or educate children. Christian intellectuals and church activists were denied membership in the Communist Party, while Christian workers or peasants were admitted subject to "reeducation."

The League of the Godless, later renamed the League of the Militant Godless, was instituted in 1925. After some relaxation in the late 1920s, a fierce assault was launched on religion in 1929. There was a big push to recruit schoolchildren to the "Young Godless." Over the next decade, the number of openly functioning churches in the Soviet Union was reduced from forty thousand to fewer than one thousand.

Leading up to World War II there was a change to a more tolerant tone. It became official doctrine that the conversion of Russia to Christianity had been historically progressive. Following the German invasion of Russia in 1941, in which the Germans permitted churches to open in the occupied territories, atheistic activities in Russia, including periodicals, were shut down. The League of the Militant Godless was quietly liquidated. Christian elements in traditional Russian cul-

ture were treated more favorably, for example, the permissible valuation of the novelist Dostoevsky was greatly enhanced.

Beginning in 1947, the relaxation of antireligious state policy began to be reversed. Churches, seminaries, and monasteries permitted to open during the war were pressured to close down. The old and crude Militant Godless was replaced with a new "Knowledge Society," which preached atheism intermingled with popular science education. Denial of elementary civil rights to active religionists was expanded and intensified in the Khrushchev period.

The Soviet era was characterized by monstrous intolerance, showing once again that any doctrinal system, supernatural or not, if made a state religion or "established church" can become a fount of bigotry, injustice, and brutality. To a large extent, the civil rights of active Orthodox Christians were restored under Mikhail Gorbachev's perestroika policies, beginning in 1986, though comparatively minor harassment of "new" sects and cults continues in the post-Soviet era. With the downfall of Communism, there was a great gain in global religious freedom. Persecution persists in mainland China (see CHINA, UNBELIEF IN), though the official line is no longer obtrusively atheistic. Instead, the government has a concept of "normal religion," which it uses to justify persecution of supposedly abnormal sects such as the Falun Gong movement.

Following the events of 1956 (Nikita Khrushchev's "secret" denunciation of Stalin and the suppression of the Hungarian uprising), there was an accelerated exodus of intellectuals from Communist parties and their affiliates in the non-Communist world. This New Left did not develop any major new ideas on materialism or religion, but some of its adherents were more favorable than the Communists to collaboration with religious organizations. This was followed by the Sino-Soviet split and the growth of "Eurocommunism"—greater diversity of thinking within the Western Communist parties themselves, which no longer were required to toe the Moscow line on every detailed issue.

In this new climate there developed both the Christian-Marxist Dialogue and Liberation Theology. The dialogue arose out of the recognition by Communists, especially in Italy and France, that any political gains for Communism would require the support of Catholics. While the Italian Communist Party went to great lengths to court Catholics, the French party cracked down on Roger Garaudy and others, and partly under the influence of Louis Althusser, reverted to a more traditional line of uncompromising hostility to religion. Garaudy himself eventually ceased to be a Marxist.

Liberation Theology, a term first used in 1973 by the Peruvian priest Gustavo Gutierrez, is primarily a movement among Catholic theologians and priests concerned about the plight of the poor and the repressions of dictatorial right-wing regimes, and to some extent admiring the Castro regime in Cuba. The writings of Gutierrez and of Juan Segundo and Jose Miranda clearly exhibit and acknowledge the influence of Marxist language and thinking. Sympathetic to the plight of poor people in these countries and to the Communist guerrilla movements, the priests absorbed much of simplified Marxism into an essentially Catholic outlook. Two priests were part of the Sandinista government in Nicaragua, and Jean-Bertrand Aristide, president of Haiti, adhered to Liberation Theology.

Liberation Theology drew inspiration from the Second Vatican Council and numbers bishops among its adherents, but approval from the hierarchy was damped down by the late Pope John Paul II, who publicly rejected the conception of Christ as a political revolutionary while acknowledging a "kernel of truth" in Marxism. Pope Benedict XVI is even more firmly opposed to Liberation Theology than his predecessor. Some Protestant religious thinkers, such as Rubem Alves and Jose Miguez Bonino, have also adopted a form of Liberation Theology.

With the fall of the Soviet Union, the collapse of intellectual credibility of Marxism, and the end of effective insurrectionary movements in the third world, both the Christian-Marxist Dialogue and Liberation Theology have declined steeply. Liberation Theology retains much support among left-leaning Catholic theologians but no longer has political significance.

DAVID RAMSAY STEELE

MARX, KARL HEINRICH (1818–1883), German revolutionary thinker. Karl Marx was born in Trier, in the

Rhineland, recently part of Napoleon's empire. He studied law, philosophy, and history, and was awarded a doctoral degree in 1841. Marx became known as an outspoken atheist, which made an academic career inaccessible. He moved to Paris, where he met Friedrich Engels, heir to a Lancashire textiles firm, who became his literary collaborator and patron. Expelled from France for political reasons, Marx moved to Brussels, where he and Engels wrote and published anonymously the widely read *Manifesto of the Communist Party* (1848). From 1849 until his death, Marx lived in London. He got some income from his writing, but depended on gifts from Engels. Aiming to write a definitive four-volume critique of economic theory, Marx read everything he could find on this subject, becoming the most knowledgeable person in the history of economic thought up to that time. Only the first volume of this monumental work, *Capital*, appeared in his lifetime.

The intellectual climate of Marx's youth was heavily influenced by G. W. F. Hegel, by consciousness of German political and economic backwardness, by the presumption that the most advanced political ideas came from France, and by a dominant Christian orthodoxy under intellectual challenge from higher biblical criticism. In 1842 there appeared *The Socialism and Communism of Present-Day France* by Lorenz von Stein, which identified socialism and Communism as middle-class and working-class doctrines, respectively. Marx became a Communist and a self-appointed spokesman for the proletariat, the new, expanding class of industrial wage-workers.

Ludwig FEUERBACH's *The Essence of Christianity* (1841) had a profound and permanent impact on Marx's thinking. The atheist Feuerbach tried to show that theology could be dissolved into anthropology: statements about God are mystified statements about human beings. Marx did not think it worthwhile to write further refutations of religious belief. Instead, he took Feuerbach one step further: since human talk about God is really mystified talk about the human community, religion is a symptom of inadequacy in the human condition and can therefore ultimately only be exorcized by changing the actual human condition through Communist revolution, so that human potential comes to be realized. Marx also came to see social institutions other than the nominally religious, such as the authority of the state and the power of capital, as being essentially akin to religion in that they represent a kind of mystification, in which the activities of humans are perceived by those humans as oppressive external powers. For example, "capital" is the accumulated labor of the workers, yet the workers see capital as an enemy and feel compelled to struggle against its demands upon their time and energies.

In his graveside eulogy for Marx, Engels cited the materialist conception of history and the theory of surplus value as his two greatest achievements. Marx's historical materialism is independent of philosophical materialism: The theory that human thoughts are physical processes in the brain is logically compatible with the theory that human development is mainly governed by ideas, while the theory that the driving force of social evolution is economic is logically compatible with the existence of supernatural entities (see MATERIALISM, PHILOSOPHICAL).

Historical materialism was not elaborated in detail, and its precise specification remains controversial. Marx sees the "social relations of production," such as the relation of master and slave or capitalist and wage worker, as the base on which rests a superstructure of ideas, including religion and law. This slippery metaphor has never been satisfactorily unpacked: if the claim is that autonomous developments in the superstructure can never modify the base, then it is obviously false, while if it means that "the economy is important" in social evolution, then it is far from distinctive to Marx.

Surplus value is the theme of Marx's economic theories. Marx developed a new, strict form of the labor theory of value in which value, defined as abstract, socially necessary labor time, is sharply distinguished from empirically observable prices, the former being considered essential to an adequate explanation of the latter. Marx's economic theories were a blind alley, rendered irrelevant by the 1870s marginalist revolution, which Marx failed to address. In the last years of his life, Marx did virtually no work on *Capital*, apparently because he had reached an impasse in his analysis.

Marx's contention that workers are necessarily exploited by capital requires the assumption that accumulated means of production do not add to the value of output, an assumption requiring an arbitrary defintion of *value*.

Marx predicted that industrial concentration, tending to eliminate competition, would lead to the disappearance of all small firms. He expected the class struggle to grow more intense, and to precipitate a Communist revolution in the industrially most advanced countries. The new Communist society, without markets or money or any coercive state apparatus, would plan the whole of industry as a single enterprise, and this would be more efficient than capitalism. Marx's view that a nonmarket organization of industry could surpass or even match the output of a market organization was criticized by Ludwig von Mises, F. A. Hayek, Michael Polanyi, and others.

MASTERS, EDGAR LEE (1868–1950), American poet and critic. Edgar Lee Masters received religious instruction in the Methodist and Episcopalian churches in his boyhood hometown of Petersburg, Illinois, and occasionally attended the Cumberland Presbyterian Church with his paternal grandparents. Both of Masters's parents had been raised as Methodists, but they enjoyed little happiness in their marriage, and Masters regarded their Methodism as a divisive force.

Early Education. The family's move to Lewistown, Illinois, in 1880 provided Masters with a better public school education that was augmented by after-school readings in various authors. His disenchantment with Lewistown's Presbyterian Church and his discovery of Robert Green INGERSOLL's *Some Mistakes of Moses* helped turn Masters into an atheist (see ATHEISM). One year in the preparatory unit of nearby Knox College brought Masters two college nicknames, "Old Soph," for Sophocles, and "the Atheist." Unable to afford a second year at Knox, Masters studied for the law and read on his own such independent thinkers as Johann Wolfgang von GOETHE, Percy Bysshe SHELLEY, Ralph Waldo EMERSON, and Walt WHITMAN, as well as evolutionists Thomas Henry HUXLEY and Herbert SPENCER.

Spoon River Anthology. By the time Masters published *Spoon River Anthology*, the book for which he is chiefly remembered, in 1915, he had both the reading and life experiences to universalize his creations. Masters's 214 free-verse epitaphs telling of the lives and deaths of villagers in a small midwestern town became a literary sensation and gave widespread circulation to his unhappiness with religion. He attacked both Christianity and churchgoers through his epitaphs, the owners of which casually violate most of the Ten Commandments. Ministers and church officers come in for special contempt: Deacon Taylor is an alcoholic; Deacon Rhodes and Sunday School Superintendent Henry Phipps are greedy hypocrites; Reverend Sibley is untruthful; Reverend Lemuel Wiley is gullible; Reverend Peet is vain; community moralist A. D. Blood is ineffective—and the list could be extended.

The epitaph reflecting Masters's own view of religion belongs to "The Village Atheist." He explains that he spent much time debating the immortality of the soul, but with his final illness upon him, he contemplates his reading and paraphrases Baruch SPINOZA in his final words: "Immortality is not a gift," he says, but "an achievement;/And only those who strive mightily/Shall possess it."

Near the end of his life, Masters said that he had long considered Spinoza's writings and had decided that God and mind are the same thing: "As to God, after thinking it over all my life, I have come to the conclusion that there is a mind as large as the universe that is in everything"; "all we see in the heavens and in the earth is Mind."

Like his friend H. L. MENCKEN, Masters enjoyed belittling the stodginess of the Bible Belt, the religiosity of the middle class, and conservative values generally. Such behavior helped make Masters famous, first through the poems in *Spoon River Anthology,* and then infamous—for he exemplified in his personal life the iconoclastic values he articulated in his books. In the end, however, Masters equated God with nature, not exactly rejecting God so much as embracing Spinoza's idea of an afterlife involving some form of intellectual knowing. "I have been called an atheist," he said, "but my atheism is that of Spinoza . . . , and he was an all-God man, not an atheist."

HERBERT K. RUSSELL

MATERIALISM, PHILOSOPHICAL. Philosophical materialism is a critical philosophical position that considers matter as the beginning, origin, and cause of whatever exists. The term was first used by Robert Boyle in *The Excellence and Grounds of the Mechanical Philosophy* (1674), and adopted by the eighteenth-century Enlightenment philosophes (M. J. A. de Caritat de CONDORCET, Condillac, Denis DIDEROT, Claude Adrien HELVÉTIUS, VOLTAIRE, and others) to designate their naturalistic positions in physics and physiology, their radical critiques against religion, their hedonistic moral codes, and their opposition to the educational and moral conventions of the *Ancien Regime* (see ENLIGHTENMENT, UNBELIEF DURING THE). Classical philosophical materialism suffered from Immanuel KANT's criticism and the effects of

idealism during the nineteenth century. The so-called materialism dispute (*Materialismusstreit*) in Germany led to the consolidation of different varieties of materialism: physicalist, moral, historical, dialectical, and so on (see CONTROVERSIES: ATHEISM, PANTHEISM, SPINOZA). Materialism's theoretical varieties have multiplied throughout the twentieth and twenty-first centuries as our scientific knowledge of matter and the universe has become more refined.

The original understanding of matter was associated since classical times with the *cosmological atomism* of Democritus, EPICURUS, LUCRETIUS, and others, which held that atoms were the smallest units of matter and could not be divided. This was a purely theoretical concept which could not be tested until the scientific revolution of the sixteenth century. Since atoms have proven to be divisible and no longer appear as the ultimate components of reality, later materialism takes a more *methodological* aspect, and all its varieties, including the Positivist or Marxist views (see POSITIVISM; MARXISM), stress the ontological primacy of matter over spirit and the priority of experimental and theoretical scientific knowledge over other types of knowledge: religious, mystical, or extrasensory.

Ontic Varieties of Materialism. The different conceptions of "matter" gave rise to a great variety of materialist systems. *Materialism* means different things depending on the context. We distinguish three principal contexts, which relate the idea of matter to *the world*, with the *idea of God*, or with *knowledge*.

In the most immediate context, the ontic one, which considers the relationships of the general idea of matter with the different realities that filled the "world" just as they appeared to us, we underlined four major types of materialism.

Cosmological materialism considers matter to be the basis of the universe and postulates it as the substratum or foundation of all reality. Its "mechanist" variant adds to matter the distribution of parts in the universe (substances, atoms, masses, and the like) and the existence of forces capable of moving and combining them, without appealing to final causes or spiritual powers. This relates to the ancient materialism of Democritus and Epicurus, nineteenth-century classical materialism, and nineteenth-century Positivism. The energistic tradition in physics, nevertheless, led G. Ostwald to proclaim in 1895 that the concept of matter was futile and that scientific materialism had been superseded. When the equivalence between mass and energy was recognized by Einstein in the twentieth century, the cosmological idea of matter, associated through the idea of a "force field" or cosmological constant, seemed to revive. But in 1932 the astronomer Jan Oort detected a type of matter that exerts gravitational force but does not emit or absorb light. Before 1980 people thought that this "dark matter" was ordinary matter in some undetectable form such as gas, low-mass stars, and star corpses like white dwarfs or black holes. Then astrophysical calculations established first that dark matter comprises 90 percent of the mass of the universe, and second that it is made up of neutrinos or some more exotic form of particle still undiscovered by high-energy laboratories. Today's cosmological view of dark matter spread throughout the universe corresponds in some ways to the ancient cosmological materialism.

Anthropological materialism centers on explaining human nature by its physical and physiological components. By distinguishing categorically the *res cogitans* (or soul) from the *res extensa* (or body), René DESCARTES contributed to the spreading of anthropological materialism in the modern age. The thesis of the materiality of the soul unified the clandestine writings of the Libertines and served as a spearhead for the Enlightenment challenge to Christian tradition. Medical and physiological discoveries demonstrating the dependence of supposedly spiritual functions upon anatomic and organic conditions allowed Julien de LA METTRIE to devise a natural history of the soul and to formulate his famous thesis "man a machine" (1748). Along similar lines David Hartley defended the indivisibility of thought and sensation (1749). Following them, Baron d'HOLBACH stressed the natural character of human capacities: "A man of genius produces a good work, in the same manner as a tree of a good species, placed in a prolific soil, cultivated with care, grafted with judgment, produces excellent fruit" (1770). In addition Holbach offered a critique of religion and proposed an ethics of pleasure and a policy of solidarity through common interest. Along the same lines Claude A. Helvétius developed an ethical program based on self-esteem and perceived usefulness, relying on education to reconcile state and private interests. In this ideological context the French Revolution took place, which for Kant's "enlightened" generation meant the definitive progress for humankind (see FRANCE, UNBELIEF IN). After the conservative reaction that followed, a reductionist and physiological materialism took form in Germany with Carl Vogt, who famously observed that "thought is to the brain the same as bile is to the liver" (1854). This materialism consolidated in the wake of Charles DARWIN's theory of evolution (1859) (see EVOLUTION AND UNBELIEF) and matured in the works of Thomas Henry HUXLEY (1863) and Ernst HAECKEL. The latter added to scientific materialism a practical moral component, setting as life's aim human corporeal welfare, pleasure, and health: "moral and ethical materialism, in the proper sense of the word, is a practical direction of life which has no other purpose than the most refined sensitive pleasure" (1868). This version of materialism was branded "vulgar" and "dogmatic" by critics, but it played an important role in the refutation of popular beliefs in spirits and abstract or transcendent realities. Albert Lange (1866) criticized it for its false aim of expanding human knowledge beyond its limits; by giving objective value to its imaginative constructs,

Lange argued that this anthropological materialism has turned into a "metaphysics." Against this criticism Paul Kurtz has reformulated, in his *Eupraxsophy* (1988), an anthropological materialism more resistant to "the transcendental temptation" (1986), reconciling HUMANISM with twentieth-century scientific progress (1991).

Historical materialism is the name Friedrich Engels applied to the historical and economic view of human social development expressed in Karl MARX's 1859 preface to *The Critique of Political Economy*. It is a perspective concerned not only with understanding the world but also with changing it. Marx's analysis distinguishes between the economic *basis* of society (the "means of production" and "relations of production") and the *superstructure* (law, science, religion, art, philosophy, and other disciplines), which he saw as being determined in the final analysis by economic factors. But antagonistic relationships obtain between the *forces* and the *relations* of production within each "mode of production" (slavery, feudalism, capitalism, and so on), which eventually cause each mode of production to break down. Marx argued in *Capital* (1867) that knowledge of the natural sciences becomes the central productive force in an industrial society. Marx expected that this contradiction, linked with the fact that man is treated as a commodity, would lead to the final crisis of capitalism.

Marx and Engels imbued the concept of matter with a *real complexity* and an *objective plurality*, separating it from subjectivism, while at the same time they underlined its dynamic and evolutionary nature. In this sense, for historical materialism, conscience is not the determining principle of human history but a result of that history which merits no special privilege. This "turning upside down" (*ümstulpen*) of Hegel's history of philosophy definitely separates philosophical materialism from idealism. Nevertheless, within the Marxist orthodoxy historical materialism was an application of dialectical materialism, polemically defined by Engels (1878) as a general science of the dialectical laws of movement (the law of the transformation of quantity into quality, the law of the interpenetration of opposites, and the law of the negation of the negation). Marxist materialism scientifically studied the origins and functioning of different historical societies in their own context. Works such as *The Class Struggle in France* (1850) and *The Eighteenth Brumaire of Louis Bonaparte* (1851) illustrate the distance between contextual and historical scientific practice and the economic determinism or the vulgar historicism usually attributed to Marx. Historical materialism was one of the most intensely debated aspects of Marxist thought during the twentieth century, not only on the part of Marxist authors who favored the materialistic view—including Lukás, Korsch, Arturo Labriola, Antonio Gramsci, the early Sidney Hook (1936), and Louis Althusser—but also among nonmaterialist sociologists, anthropologists, and historians including Max Weber, Mannheim, Merton, Gouldner, and others. A North American version, which closely follows historical materialism but adds ecological elements, is the *cultural materialism* defended by Leslie A. White (1959) and Marvin Harris (1982).

Under the heading of *formalist materialism*, I embrace the heterodox position of those who have explained the abstract entities of "ideal" or "essential" nature from matter alone without reducing them to the subjective. In the philosophy of ARISTOTLE, matter was already viewed as an intrinsic *active cause*. It also exerted *operative power*, so that "things which have in themselves the principle of their genesis, would exist by themselves when anything external would prevent it." This view regarding matter's self-sufficiency to develop leads to a heterodox tradition. The expression "intelligible matter" was coined by Plotinus, and was developed through Scotus Eriugena's "divisions of Nature" and Avicebron's "fountain of life," culminating in Nicholas of Cusa, for whom matter is the "undetermined possibility" in which the earth, the sun, and the rest of the universe are *contracted*. Against the concept of passive and inert matter, Giordano BRUNO, that follower of Copernicus and Galileo GALILEI, identifies matter with form. This tradition tends to meander beyond the ontic context, verging into matters of ontology and the theory of science. Manifesting this form of materialism in the twentieth century is the Russian Formalism of Bakhtin and Voloshinov (1929).

Materialism and Atheism. It was traditionally considered that "materialism" entailed the negation of God or ATHEISM, as under Soviet Communism (see PROPAGANDA, ANTIELIGIOUS [SOVIET]). However, there are two ways of getting around the incompatibility between theism and materialism. The former entails conceiving of the gods as corporeal entities, after the practice of Epicurus and Thomas HOBBES, who did not deny God's existence but were *practical atheists*. Another, more subtle, method involves adding a rational divine principle which operates causally in the world, either *dissolved inside* (stoic pantheism), or *from outside* by creating atoms (as in Tertulianus or Pierre Gassendi), or arranging it (enlightened deism), or transmitting to it force and movement in the style of Ralph Cudworth and the Cambridge Platonists, for whom matter was of a *plastic nature*, a living force which directly derives from God (1678). Newton and his disciples took advantage of scientific progress to support their religious beliefs on this basis.

Their atheist rivals, rationalists as well, did the same. Baruch SPINOZA (1677) accepted the equivalence between God, Substance, and Nature at the level of *general ontology* to turn atheism into an impregnable position. Identifying God with *everything which exists* denies meaning to the traditional distinctions between *matter* and *spirit* as different realities. For Spinoza there is only one substance, which is however not one, but multiple or even *infinite*, composed of an infinity of attributes of which we know but two: *thinking* and *exten-*

sion. Spinoza refutes the ghost-in-the-machine myth (Descartes) and also Gottfried Wilhelm von LEIBNIZ's monistic psychophysical parallelism, because neither body nor soul are independent substances. On the contrary, "the order and connection of ideas is the same as the order and connection of things." Thus, "I am my body" and "by body I mean a mode which expresses in a certain determinate manner the essence of God, in so far as he is considered as an extended thing." Atheism was never so subtle and daring; Spinoza's *Ethics* should be a Bible for every unbeliever.

In this line Gustavo Bueno formulates an ontological materialism (1972) which also distinguishes between a general level (*Natura naturans*) and another special level (*Natura naturata*). Materialism is the exercise of philosophical reason in decoding the *symploké* or puzzle of ideas that defines our present experience. Philosophical reason is different from the scientific, political, and technological modes of reasoning because it is applied to ideas. Yet it is not idealistic, because ideas are functions whose values are determined in each historical moment according to the objects in which they become incarnated. This general-ontological materialism is opposed to the metaphysical idea of "universe" as *omnitudo realitatis* ("everything real is rational"—Hegel) that culminates in monism or in harmonic holism; but it does not accept a limitless multiplicity. In the regression from what is a given process (the objects themselves), the idea of radical plurality or general-ontological matter is reached as a limit. Nevertheless, materialism is an alternative to NIHILISM, which dissolves reality; so it doesn't get stranded with an abstract and indeterminate "matter," but progresses from it toward worldly realities. In this progression worldly beings are organized in three special-ontological genres of materiality (M_1, or the group of physical objects, or extensive bodies; M_2, or the collection of subjective realities—headaches, experiences, etc.; and M_3, or the set of "essences"—numbers, theories, etc.—which are not exactly subjective nor physical but rather are materially objective). The reduction of any genre of materiality into another is criticized, because the three are "incommensurate."

This ontological materialism supports a militant atheism against the new wave of fundamentalisms. For this neither the Enlightenment theory about religion beginning with priestly deception nor the Marxist idea about religion as "the opium of the people" is enough. According to Bueno (1985), throughout their evolution human beings were accompanied by religion not because they had a divine gene or some sacred faculty inside, but because they had arisen in contact with the large predatory animals of the Pleistocene Age, which humans could hunt but to which they could also become prey. Gods are not anthropomorphic projections of consciousness (as in Ludwig FEUERBACH), but material *Numens* shaped by humans in the image of wild beasts. Ethology, the study of animal behavior, is the new theology. It is essential to atheistic materialism to claim that many cultural facts, usually relegated to the domains of spiritualism and idealism (zodiacal signs, sacrifices), are in fact materialistic events.

Finally, scientific materialism involves denying that matter remains constrained within the conscious or epistemological sphere of the world. Its opposite is "immaterialism," the assertion that the domain of ideas and knowledge subsists independently of matter. Scientific materialism furnished a third context whose action we can recognize when we review the process by which methodological materialism has built up from Hobbes to Rudolf Carnap. For Hobbes, to know something is to understand its *genesis*. That is why the sole possible objects of human knowledge are bodies and their movements, and philosophy is divided in two: *natural* philosophy studies organic bodies, and *civil* philosophy studies the social body (*De Corpore*, 1655). Diametrically opposed to this naturalism is Ernst Mach's *Empiriocriticsm* or phenomenalism. For Mach (1900), scientific knowledge entails the study of phenomenal relationships, so that matter is reduced to "a certain relation of the sensitive elements in accordance with a law." Vladimir Ilyich Lenin (1909) criticized this "immaterialist" position, but his materialistic theory of science could not counteract the enormous success enjoyed by "objective idealistic" theories of science expressed by PLATO and more recent neo-Kantians such as Windelband, Cohen, and Cassirer.

The twentieth century also saw the failure of the "materialist" efforts of LOGICAL POSITIVISM due to its extreme linguistic reductionism. Carnap's "physicalism" got bogged down in the "statements of protocol" which supposedly describe the data transmitted by senses. The "unified science" thesis (Otto Neurath) could not halt Carl Gustav Hempel's theoreticism and the "idealist" bloom of the "new post-Popperian philosophy of science" as represented by Thomas Kuhn, Paul Feyerabend, Imre Lakatos, and others.

The so-called categorical closure theory (1976/1994) of Bueno, which studies the connection between the level of facts and theories as the essence of the process by which scientific truths are constructed—these are not analytic but "synthetic identities"—provides a materialistic theory of science. In this sort of materialism, the sciences have no formal object, but rather are fields of heterogeneous objects; for example, biology does not deal with life, but with tissues, organs, cells, nucleic acids, and so on. The multiple material objects of a scientific field do not exist apart from the productive activities that scientists carry out when they form investigative teams or found scientific research institutions.

ALBERTO HIDALGO DE TUÑON

McCABE, JOSEPH MARTIN (1867–1955), English atheist scholar. One of the most remarkable—and neglected—polymaths of the twentieth century, Joseph McCabe was a difficult personality with few friends among his contemporaries. He was a gifted popularizer long before that was recognized as an honorable vocation. What is more, McCabe was ready to identify himself as an atheist (see ATHEISM), materialist (see MATERIALISM, PHILOSOPHICAL), and feminist (see WOMEN AND UNBELIEF; WOMAN SUFFRAGE MOVEMENT AND UNBELIEF) long before these terms were academically respectable.

Joseph Martin McCabe was born on November 11, 1867, into an English family of modest means. As the second-born, Joseph was earmarked for the church, which he duly entered at sixteen to study for the priesthood, despite an occasion of sexual abuse that even someone as emancipated as McCabe did not feel able to disclose until he was seventy-four years of age. From early on in his church career, McCabe suffered doubts, which were not alleviated by the official response to them, which was known as the blush technique: "How dare I, an ignorant boy, doubt what such legions of great men believed!"

Father Antony, as he became, rallied repeatedly, expelled his doubts, and rose through the ranks. He did so well in his studies that he was appointed professor of philosophy and ecclesiastical history at a seminary in London in 1890, at the age of only twenty-three. But from 1893 onward, Father Antony's doubts became, in his words, dark and permanent, and he spiraled into a crisis of faith at the end of 1895. On Ash Wednesday 1896, he left the church to begin a new life in the wide world. McCabe was twenty-eight when he emerged into the world, completely untutored in its ways. His first purchase was a book on etiquette.

McCabe soon found a new life in London, becoming associated with the fledgling RATIONALIST PRESS ASSOCIATION (RPA). As he had done in the Catholic Church, McCabe rose quickly through the ranks of the RPA. By 1914 a Christian opponent described him as the RPA's "leading spirit." For more than half a century McCabe made his living from his pen, writing an extraordinary range of books, monographs, pamphlets, magazine and newspaper articles, and encyclopedia entries—and indeed, entire encyclopedias.

As well as his written output, McCabe gave more than four thousand lectures around the world, from Melbourne to the Rhineland, and from the Harvard Club in the United States to coal mines in New Zealand. McCabe also took part in at least a dozen major debates with religionists, creationists (see CREATIONISM), and Spiritualists (see SPIRITUALISM AND UNBELIEF). The most notable of them was with the eminent Spiritualist Sir Arthur Conan Doyle in 1920. The research McCabe undertook for that debate alone generated two books.

But as with his experience in the Roman Catholic Church, McCabe's time in organized FREETHOUGHT was not without conflict. McCabe never came to terms with the fact that people leave religion in many different ways. He had taken the passionate route of the betrayed believer, one whose belief had stolen twelve years from

his life and exacted a great toll in suffering and isolation. McCabe always found it difficult to accept that others, whose path to freethought had been less fraught with suffering, were equally sincere.

Over the course of a quarter of a century, McCabe managed to offend just about everyone in rationalist circles (see RATIONALISM). McCabe broke with the RPA in 1928, although a partial rapprochement was effected in 1934. Most of his later works were published by the eclectic American publisher Emmanuel HALDEMAN-JULIUS. McCabe died on January 10, 1955, aged eighty-seven. He expressed the wish (which went unfulfilled) to have as his epitaph, "He was a rebel to his last breath."

McCabe was deeply interested in popularizing evolution (see EVOLUTION AND UNBELIEF; DARWINISM AND UNBELIEF; RELIGION IN CONFLICT WITH SCIENCE) for nonspecialist readers. The outstanding feature of his understanding of evolution is its breadth and accuracy. He had an admirable ability to distinguish a genuine intellectual development from a passing fad. And on most occasions when he departed from the conventional wisdom of the time, it was to assert a strictly Darwinian reading of the issue at hand. In these instances, of course, events have largely proved him correct.

More often than not it was the very same academics who scorned McCabe as a popularizer who succumbed to the fads he was able to see through. For example, McCabe was intelligently skeptical of social Darwinism, which he denounced in 1914 as a "pseudo-scientific application of evolutionary views to social problems," insisting that there is no scientific justification for a doctrine of eternal struggle. He was also scornful of the fad among some evolutionists between the wars known as "emergent evolution," which sought to emphasize a vitalist creativity in each new evolutionary development. McCabe dismissed emergence as nothing more than "mystic machinery." He noted that it was this variety of evolutionary thinking that the Church of England had in mind when it decried the conflict between religion and science. And he dismissed EUGENICS as "secular Calvinism."

Neither was McCabe guilty of scientism, or placing faith in science as an agency of salvation. Rather than giving "laws of nature" a cosmic inevitability, McCabe wrote of them straightforwardly as trustworthy "only insofar as [the scientist] knows it to have been based on extensive observations. He keeps an open mind until repeated observations all the world over have brought the same result." McCabe made the simple observation that we "do not want to substitute the word science for the word God."

With respect to the Catholic Church, McCabe wrote both as an original scholar and as a popularizer. Fluent in Latin, Greek, French, German, Spanish, and Italian, McCabe was able to use original documents not available to others in the course of his work. *Crises in the History of the Papacy* (1916) remains a sound work of historical writing and was many decades ahead of what Catholic writers were able to say about their church. McCabe also wrote some autobiographical studies of living in the church, in particular *Twelve Years in a Monastery* (1897). In this moving work, McCabe writes movingly of fellow priests driven mad by sexual frustration, ruined by drink, or sunk into triviality as the only means of surviving the unnatural regime under which they lived. His autobiographical works avoided the tabloid sensationalism that so many others writing this sort of work indulged in.

Only later in his life did some of McCabe's writing on the Catholic Church become polemical. He never got used to the level of abuse he received from lesser apologists; the misdeeds of Pius XII's pontificate further contributed to this trend. Even in this work he rarely lapsed into anti-Catholic ranting, as so many of his contemporaries were wont to do. The best of his later works on the Catholic Church is *A History of the Popes* (1939).

Perhaps most remarkable was McCabe's record as a feminist. His three main publications in this area, *The Religion of Woman* (1905), *Woman in Political Evolution* (1909), and *Key to Love and Sex* (1928), remain the most unjustly neglected examples of rationalist feminism in the twentieth century. Once again McCabe avoided the errors of many of his contemporaries of indulging in the stereotyping of women as wives and mothers, the bearers of the next generation, while appearing to be ardent feminists. McCabe frequently criticized males who advocated female liberation merely so that they could have a freer access to problem-free sex. He patiently refuted all the prejudices of the day about women being more emotional, more religious, and less capable of sustained action than men. He even devoted time to defending blondes from the usual accusations.

McCabe wrote widely in other areas, including some well-received biographies of Saint Augustine, Pierre Abelard, Johann Wolfgang von GOETHE, Charles-Maurice de Talleyrand, and Cardinal Richelieu. He also wrote an underappreciated critique of George Bernard SHAW and a history of divorce laws. He even wrote two novels, *In the Shadow of the Cloister* (1908, under the pseudonym Arnold Wright) and *The Pope's Favorite* (1917).

Even where he was wrong, McCabe set a good example. For instance, he defended the notion of the ether far longer than was seemly, which also made it difficult for him to accept Albert Einstein's theory of relativity. But when, by the mid-1920s, he did finally accept that he had been wrong, he launched into explaining the theory of relativity to his readers. In other words, when the evidence became overwhelming, he was prepared to change his opinion and adopt new views.

Joseph McCabe was a gifted and responsible popularizer of contemporary thinking to nonspecialist readers. Despite being largely self-taught, he avoided all the fashionable errors of his day and gave his readers sensible,

balanced, and reliable overviews on a staggering variety of subjects. His books, whether on evolution, the Catholic Church, feminism, or a host of other subjects, anticipated current ideas by two generations. McCabe deserves to be linked with Isaac ASIMOV and Carl SAGAN as among the most intelligent, acute, and lucid popularizers of the twentieth century.

BILL COOKE

McCOLLUM, VASHTI CROMWELL (1912–2006), American church-state litigant. Vashti Ruth Cromwell, named for the queen in the first book of Esther, who was one of few biblical women to stand up for women's rights, was born in Lyons, New York, to the freethinkers Arthur G. and Ruth C. Cromwell. She was raised in Rochester, New York, and after graduation from a public high school attended Cornell University on scholarship until the stock market crash of 1929. After transferring to the University of Illinois Champaign-Urbana, she met and married Dr. John P. McCollum, had three sons, and earned two degrees.

Vashti McCollum was to live up to her namesake when she was pressured to enroll her eldest son, Jim, in a Christian religious education class that was offered during school hours in the Champaign public schools. Resisting the pressure at first, she and her husband eventually relented and allowed Jim to attend the classes for the balance of his fourth-grade year. However, the following year, the McCollums, feeling that such a program was inappropriate in the public schools, refused further participation.

After unsuccessful attempts to get the program discontinued, McCollum filed suit in the Champaign County Circuit Court in the late summer of 1945. This became a challenging period for the McCollums, marked by physical confrontations between Jim and his peers, vandalism of the McCollum home, and unsuccessful efforts to end Dr. McCollum's employment at the university. He was protected by tenure, but her employment as an adjunct instructor in the women's physical education program was not, and she was terminated.

A three-judge circuit court panel decided that, in spite of the Illinois constitution's clear language to the contrary, Champaign's religious education program violated neither the state constitution nor the establishment clause of the First Amendment to the US Constitution. The Illinois Supreme Court agreed, and the case was appealed to the US Supreme Court, which granted certiorari in the fall of 1947. On March 9, 1948, the Supreme Court handed down its landmark decision in *McCollum v. Board of Education* (333 U.S. 203 [1948]), finding for McCollum and against the schools in an 8–1 verdict.

Written by Justice Hugo L. Black, the *McCollum* decision was a landmark case in US constitutional law. Its significance was that it was the first decision to hold the several states accountable to the strictures of the establishment clause under the due process clause of the Fourteenth Amendment, which makes provisions of the US Constitution binding upon the states. All subsequent church-state decisions involving school prayer, aid to parochial schools, sectarian religious displays on public property, and other such incursions into Thomas Jefferson's "wall of separation between Church & State" by states and municipalities descend from the *McCollum* case.

For several years after the conclusion of her landmark legal battle, McCollum became active in the humanist movement, serving on the board of the American Humanist Association and as its president. Among the awards and recognition accorded her in subsequent years were the prestigious Johns Haynes Holmes Award (now the Holmes-Weatherly Award) from the Unitarian Fellowship for Social Justice. She also has received recognition from the Illinois ACLU; the Champaign County chapter of the Illinois ACLU; the Roger Baldwin Foundation; Americans United for the Separation of Church and State; the Rochester, New York, chapter of Americans United; and the American Humanist Association.

Vashti McCollum wrote a book about the circumstances of her case, *One Woman's Fight*, which remains in print. She died in August 2006.

JAMES McCOLLUM

McGEE, LEWIS (1893–1979), African American Unitarian leader. Lewis McGee was the first minister of an experimental interracial congregation in Chicago. He was born on November 11, 1893, in Scranton, Pennsylvania. Much like his father, who became an African Methodist Episcopal (AME) minister, Lewis McGee felt he was called to the ordained ministry. The family moved frequently due to his father's status as an itinerant preacher. In 1912 McGee graduated from high school and then attended the University of Pittsburgh for a year before going to Payne Theological School at Wilberforce

University, where he received a Bachelor of Divinity (BD) in 1916. The following year he was ordained as an elder in the AME church.

In 1918 McGee joined the army as a chaplain, and later served as minister for a number of AME churches in Ohio and West Virginia. In 1927 he moved to Chicago where he became a social worker with Illinois Children's and Home Aid Society. While there McGee took college courses and subsequently received a Bachelor of Arts degree from Carthage College. He returned to parish ministry briefly in Gary, Indiana, before leaving to join the US Army once again as a chaplain in 1943. He remained in the military until after World War II was over and was discharged with the rank of captain. That autumn, he married his wife, Marcella.

McGee's interest in Unitarianism (see UNITARIANISM TO 1961) evolved gradually. He later commented that he had encountered Unitarianism many years before attending seminary, when he stumbled across a copy of the *Christian Register* while delivering mail. He later met Curtis Reese, a Unitarian minister, and read Reese's book of humanist sermons in 1928 (see HUMANISM; RELIGIOUS HUMANISM). Reese told him then that the Unitarian church offered no opportunities for African Americans. After the war, McGee felt like the time for integration had arrived, and he decided he wanted to be part of an interracial church. He enrolled at Meadville Lombard Theological School in the spring of 1946, where he studied for a year, after which he received Unitarian fellowship. Meadville Lombard president Wallace Robbins tried to help McGee find a position, but a new opportunity opened in Chicago.

By conducting a survey of African Americans in Chicago's South Side neighborhood on behalf of the American Unitarian Association (AUA), McGee was charged with inquiring about the potential for starting a Unitarian church in the African American community. Ultimately, McGee was able to convince the AUA that there was room as well as interest for an interracial church in Chicago. This racially integrated fellowship was organized on April 25, 1948, and McGee was installed as minister in June of that year. Although this fellowship grew to nearly one hundred members, it never met with the overwhelming success that either he or the AUA had hoped for. After he left the fellowship, he worked for a time at the AMERICAN HUMANIST ASSOCIATION. Meanwhile, he served as senior minister of several predominantly white churches in southern California, the first African American to do so in the United States. He died on October 10, 1979, in Pullman, Washington, leaving his wife and two children, Ruth Harris and Charles McGee.

JUAN FLOYD-THOMAS

McKAY, CLAUDE (1890–1948), American poet and humanist. One of the leading poets of the humanistic arts movement known as the Harlem Renaissance, Claude McKay was born in Jamaica in 1890 and immigrated to the United States in 1912. He wrote poetry and read FREETHOUGHT literature by the age of ten.

His parents were deeply religious. However, McKay was an agnostic throughout most of his life. His older brother, U. Theo, was one of the most important influences in his life. U. Theo taught him about great freethinkers such as Thomas Henry HUXLEY and Charles BRADLAUGH. McKay eventually adopted a secular worldview (see SECULARISM) informed by FREETHOUGHT.

In his early teens, McKay joined London's RATIONALIST PRESS ASSOCIATION and accepted Fabian socialism. Later, he lived with U. Theo and his wife. Feeling alienated, McKay discussed his AGNOSTICISM with other boys his age. He was successful in bringing some of his new friends into the freethought fold by founding a young agnostics group.

Embracing his older brother's worldview, McKay later fought against police brutality and opposed cruelty to animals. He was deeply influenced by Fabian feminists and the literature of British Victorian women writers, especially George ELIOT. He was very sympathetic toward prostitutes and their plight.

After racial violence erupted across the United States in 1919, McKay wrote perhaps his most famous poem, "If We Must Die." The poem called for blacks to defend themselves against violent attacks by white supremacists. Winston Churchill would later quote from the poem to rally the British against the Nazis during World War II.

In 1929 McKay wrote a novel titled *Banjo: A Story without a Plot*. This story about an African musician in Paris deeply influenced leaders of the Negritude movement, including the Academy of Humanism laureate Léopold Senghor.

On October 11, 1944, suffering from hypertension, heart disease, and worsening health, and disillusioned with his secular worldview, McKay accepted baptism in the Roman Catholic Church. He moved from New York to Chicago to work for the Catholic Youth Organization. However, his contributions as a secular humanist continue to enlighten people throughout the world.

NORM R. ALLEN JR.

McQUEEN, BUTTERFLY (1911–1995), American atheist actress. Best known as the memorable character Prissy in *Gone With the Wind*, who spoke the immortal line, "Oh, Miss Scarlet, I don't know nuthin' 'bout birthin'

babies," Butterfly McQueen hated her given name, Thelma. The name "Butterfly" came from the way she waved her arms in a 1935 Harlem Theater group production of *A Midsummer Night's Dream*; she later had the name legalized.

McQueen was born an only child in Tampa, Florida. She attended public school in Augusta, Georgia, and graduated high school in Long Island, New York. In 1975, at the age of sixty-four, she earned a bachelor's degree in political science from the City College of New York.

McQueen played a maid in many of her roles, and worked as a maid in real life. From 1947 to 1951 she had a regular role on the controversial radio show *Beulah*, whose stereotypical portrayal of blacks as dim-witted, subservient, and inarticulate was criticized by activists, including the NAACP. She later starred on the television version of *Beulah*, also known as *The Beulah Show* (1950–52).

McQueen lamented the fact that she had to assume stereotypical roles. However, blacks simply were not respected as complete human beings by the Hollywood establishment throughout most of her career. Indeed, she could not attend the premiere of *Gone With the Wind* in 1939 because it was held at a whites-only theater.

Many of McQueen's roles, particularly her role as Prissy, have been the source of much black embarrassment and anger. The NAACP and other civil rights organizations boycotted *The Beulah Show*, and criticized McQueen and other black actors and actresses for taking demeaning roles.

McQueen had roles in other memorable productions, such as television productions of *The Adventures of Huckleberry Finn* in 1981 and 1985, and a television production of *The Green Pastures* in 1957. In 1980 she won an Emmy for her role in a children's production called *The Seven Wishes of a Rich Kid.*

McQueen was a lifelong atheist (see ATHEISM) and was a member of the Freedom From Religion Foundation from 1981 until her death in 1995. In 1989 the foundation awarded her a Freethought Heroine Award. In the same year, African Americans for Humanism contacted her to ask if she would be interested in working with the group to promote humanism among African Americans. She declined, saying that her hero, Booker T. Washington, was not listed as a great African American humanist in a partial list of black humanists in one of the group's brochures. (In fact, Washington was not a humanist—he was strongly religious.)

McQueen was highly critical of religion—particularly Christianity. She said that black slaves were attracted to Christianity because church attendance on Sundays was the only time they were permitted to dress up.

McQueen died in an accident caused by a fire. Her body was donated to medical science and she left the balance of her personal bank account to the Freedom From Religion Foundation.

NORM R. ALLEN JR.

McTAGGART, JOHN McTAGGART ELLIS (1866–1925), English philosopher. A Hegelian philosopher, John McTaggart Ellis McTaggart achieved the rare feat of combining a commitment to ATHEISM with an equally serious commitment to personal immortality. McTaggart's contribution to the development of twentieth-century atheism is more substantial than he is given credit for, although the fault for this omission lies with McTaggart himself.

McTaggart was the son of Francis and Caroline Ellis, the surname McTaggart being added by his father in order to fulfill a condition for an inheritance. The now-prosperous family sent young McTaggart to the prestigious Clifton School and to Trinity College, Cambridge. While visiting his widowed mother in New Zealand in 1892, McTaggart met Margaret Elizabeth Bird. The two married on his next visit to New Zealand in 1899. McTaggart's entire academic career (1897–1923) unfolded at Cambridge, where he developed his brilliant though idiosyncratic blend of Hegelian idealism and atheism. He died suddenly and unexpectedly in January 1925.

McTaggart presented his philosophy of religion primarily in his work *Some Dogmas of Religion* (1906) and *The Nature of Existence* (1921). He and G. E. Moore were good friends, despite the latter's role as the most influential critic of British Hegelianism. Along with Moore and Bertrand RUSSELL, McTaggart belonged to the irreverent Cambridge club known as the Apostles. And like Russell, he was happy for some of his speeches to be published by the RATIONALIST PRESS ASSOCIATION.

In *Some Dogmas of Religion*, McTaggart's justification for religion was dauntingly rigorous. Any religious belief, he argued, requires the prior belief that the universe is good. But there is no reliable method by which one can believe this other than dogmatically. And dogmas in turn require a metaphysical investigation for which most people lack the time or inclination. Therefore, regardless of whether any religion is actually true, the vast majority of people accept their religions on false grounds. This in turn leads to a larger number of people living without religion, but also without its consolations; and who will therefore be unhappy. Having said this, McTaggart was equally unconvinced of any link between religious belief and happiness.

Running counter to the naturalistic trend of this line of argument, McTaggart advocated a mitigated version of personal immortality. After criticizing most arguments

against, as well as many of those for, personal immortality, McTaggart advocated a concept of a disembodied mind linked with a universal spirit composed principally of love.

Among professional philosophers McTaggart is best remembered for his work in logic, which remains influential to this day. Outside of logic, McTaggart's thinking suffered from his almost complete ignorance of science and his inability to see its value. For instance, while his arguments against the existence of God were very powerful, they were predicated on his conviction of the unreality of time, which has not achieved general acceptance.

BILL COOKE

MECHANISM. Mechanism is the view that human beings are machines in a mechanical world. The idea that the whole universe is a vast machine was encouraged by the work of René DESCARTES and, especially, Sir Isaac Newton. Influential in the development of Enlightenment attitudes, it now has mainly historical interest.

Mechanism and Materialism. What is to count as a machine? If only systems powered by water, springs, steam, or oil are machines, mechanism is obviously false. If you count sophisticated computer-controlled robots as machines, mechanism may strike you as possibly true. If you count anything as a machine provided only that it works in accordance with the laws of physics, you may regard mechanism as scarcely open to serious challenge, since by that definition everything in the world is a machine—unless, as some maintain, consciousness or other aspects of the mind resist explanation on that basis. The view that all aspects of mentality are explicable in physical terms is materialism (see MATERIALISM, PHILOSOPHICAL; PHYSICALISM). Understood in the broad sense just noted, therefore, mechanism adds nothing to materialism.

Descartes thought that although all animal behavior and much human behavior was explicable mechanically, the most characteristic features of human behavior were not. If a machine were constructed to resemble a human being, two things would betray it. One is that it could not produce utterances suitable for the expression of thoughts appropriate to its situation. The other is more general: all its behavior would be seen to spring from built-in responses rather than from reason. (The behavior of computers does not generally consist of built-in responses; but there were no computers in the seventeenth century). On other grounds, too, he argued that human behavior could only be explained in terms of something utterly different from anything mechanical or, indeed, physical: an immaterial mind, interacting with the brain.

Gottfried Wilhelm Von LEIBNIZ argued that if thoughts and feelings could be explained "mechanically, that is, by means of shapes and movements," then we could imagine a suitable machine enlarged so as to allow us to enter it, just as we can enter a mill. But inside there would only be pieces of machinery turning or pushing against one another, and nothing—according to Leibniz—that could explain thoughts, feelings, or perceptions. In one form or another that reasoning remains influential, but it is hardly compelling. Leibniz seems just to have assumed that machines could not think. Why otherwise should he have expected that gazing at the machinery would reveal whether or not thinking and feeling were going on?

Turing Machines. It has become clear that the brain does not have the structure of a computer; so if mechanism implies we are just like computer-controlled robots, it is false. However, more general ways of defining machines were devised by Alan Turing. One type of "Turing machine" is a *finite deterministic automaton.* This has a finite number of possible states, a finite number of possible inputs, and a finite number of possible outputs. At any moment it is in one of those possible states and may be receiving one of those possible inputs. For each pair consisting of a state and an input, the system's next state and output are thereby determined. Although all systems of this kind are realizable by programmed computers, some might also be realized by very different structures, including human bodies.

Arguments Against. Two famous arguments have been thought to refute any variety of mechanism based on such ideas.

John Searle's "Chinese Room" argument attacks the view that a suitably programmed computer would be intelligent. If a certain program were supposed to make a computer understand Chinese, for example, then when he himself played the part of the computer, following instructions in English equivalent to the original program, that ought to make *him* understand Chinese. But it would not, since he would simply be shuffling what were, for him, meaningless squiggles. He concludes there could be no such program. His opponents object that it is beside the point that *he* does not understand Chinese; what matters is whether the whole system, of which he is only a part, understands Chinese. After all, none of his brain cells understands English, but the system of which they are components does.

Kurt Gödel proved it was impossible to devise a consistent set of axioms and rules (a "formal system") for generating all and only the truths of arithmetic. Some have attempted to use this result against mechanism, arguing that if we were machines of the sort in question, none of us would be able to do what any competent logician, by following Gödel's methods, could do. The argu-

ment depends on several problematic assumptions. One is that if we instantiated formal systems, they would be consistent. Another is that if a certain formal system successfully models the workings of a human body whose activities include doing arithmetic, then that formal system must itself be adequate for arithmetic. This may seem reasonable, especially when combined with another assumption popular in the early days of artificial intelligence (it no doubt influenced the Chinese Room argument): that human cognition can be appropriately modeled in terms of the processing of formulas resembling sentences or sentence parts. But the behavior of human bodies can be described and explained at different levels, including the atomic, the molecular, and the psychological. Conceivably, a formal system that was not itself adequate for arithmetic could successfully model the workings of a human body that, as a whole, engaged in sophisticated mathematics.

Conclusion. If you are convinced the world is purely physical, then you are a physicalist (materialist). Physicalism does not commit you to anything but the uninteresting version of mechanism noted in the second paragraph above. Good reasons for going beyond that are hard to find.

ROBERT KIRK

MENCKEN, HENRY LOUIS (1880–1956), American journalist and cultural critic. Best known for his scathing reports of the Scopes trial of 1925 (see EVOLUTION AND UNBELIEF), H. L. Mencken referred to himself as a "theological moron": he had "no sense whatever of the divine presence or of a divine personality," although he was quick to note that he was "anything but a militant atheist." In his youth, he and his brother were sent to a Sunday school by his father, although he claimed that this was only because his father wished to have some peace and quiet for afternoon naps. Mencken states that his father was "what Christendom abhors as an infidel," and it was no doubt from him that Mencken first derived his ANTICLERICALISM, later augmented by his study of Friedrich NIETZSCHE. He would later translate Nietzsche's *The Antichrist* (1920).

It is a vexing question whether Mencken was an actual atheist, "militant" or otherwise. In the late essay "What I Believe" (1930), he stated only that "I believe that religion, generally speaking, has been a curse to mankind—that its modest and greatly overestimated services on the ethical side have been more than overborne by the damage it has done to clear and honest thinking." He went on to declare flatly that "the evidence for immortality is no better than the evidence for witches, and deserves no more respect."

For the majority of his career, Mencken—as a columnist for the *Baltimore Evening Sun* (1906–48), coeditor of the *Smart Set* (1914–23), and founder and editor of the *American Mercury* (1924–33)—devoted his energies to attacking religion for the social, cultural, and political harm it causes. Much of his writing lampoons religion and religious figures with pungent satire and ridicule. He took particular aim at flamboyant religious figures such as the evangelist Billy Sunday (whose several revival meetings in Baltimore in 1916 Mencken attended), Aimée Semple McPherson (whom he saw during a visit to Los Angeles in 1926), and the "radio priest" Charles Coughlin. These individuals regaled him because they embodied, in the religious sphere, the entertaining buffoonery he found so richly prevalent in American politics.

Because his prime political concern was absolute freedom of speech, Mencken made no attempt to silence religious discourse or practice, even at its most preposterous and dangerous. He even condemned a Maryland law making it a misdemeanor for Christian Science "healers" to accept a fee for their services. He expressed little concern that such healers' "bungling" might cause grave injury or death to the persons they treated, since he felt that the prohibition of Christian Science teaching might lead to other and worse suppressions. Conversely, he spoke out strongly when Christian Scientists attempted to suppress the sale of a biography critical of its founder, Mary Baker Eddy, in 1929.

Early in his career Mencken waged incessant battle against local and national religious figures for their attempts to legislate morality, specifically with regard to

Sunday laws. Maryland was laboring under a particularly harsh statute of 1723 (extended in 1874) prohibiting a wide variety of activities on Sunday, ranging from playing golf to orchestra concerts. The onset of Prohibition in 1920 did nothing to assuage Mencken's fears that religion was becoming dangerously linked with government. He came to believe that the passage of the Eighteenth Amendment was largely a product of heavy lobbying by the Anti-Saloon League, itself the creature of the Baptist and Methodist churches. More controversially, Mencken also maintained that the rise of the Ku Klux Klan (whose objects of attack included not only African Americans but also Catholics, Jews, and secularists) was also largely a function of the Methodist and Baptist churches—a claim that has a nucleus of truth but which Mencken exaggerated considerably.

Mencken gained his greatest celebrity by his coverage of the Scopes trial in 1925. It is, however, not widely known that he remained in Dayton, Tennessee, only for the first week of the trial, missing Clarence DARROW's spectacular cross-examination of William Jennings Bryan in the trial's second week. Nevertheless, Mencken's numerous and extraordinarily mordant reports, widely syndicated, permanently affected the American people's perception of the trial and its ramifications. In these articles Mencken emphatically repeated his long-held position that religion was a kind of security blanket embraced by the ignorant and the timid as a shield against intellectual and social advances they could neither understand nor welcome. His famously vicious obituary of Bryan—first published as "Bryan" in the *Baltimore Evening Sun* in July 1925 revised as "William Jennings Bryan" in the *American Mercury* in October 1925, and revised again as "In Memoriam: W. J. B." in *Prejudices: Fifth Series* (1926)—has been criticized as an uncharitable attack on the dead, but Mencken was well aware of the dangers that Bryan's brand of fundamentalism posed to freedom of thought and expression.

Mencken's most exhaustive treatment of religion is found in *Treatise on the Gods* (1930), but this is an unwontedly sober and rather dry chronicle of the evolution of religion (specifically Christianity) from primitive thought, and its anthropology is now somewhat outdated. But Mencken remained a fierce battler of religion to the end: In "What Is to Be Done about Divorce" (1930), he asserted that the liberalization of divorce laws would not occur "until the discussion is purged of religious consideration." He also claimed that African Americans must free themselves from the influence of evangelical Christianity—which he identified as a holdover from the era of slavery—if they were to attain the civil and political rights they deserved.

S. T. JOSHI

MENDUM, JOSIAH P. (1811–1891), American FREETHOUGHT editor and publisher. Josiah P. Mendum was born in Kennebunk, Maine, on July 7, 1811. He was brought up in the tolerant Universalist tradition (see UNIVERSALISM TO 1961), but while still a young man was radicalized by the persecution of Abner KNEELAND, the editor of the rationalist newspaper the *BOSTON INVESTIGATOR* (see RATIONALISM). Kneeland was prosecuted for BLASPHEMY in 1834 and abruptly left Boston in 1838. The *Investigator* was saved from closure that year when Mendum became its publisher. Two years later he became sole owner.

Along with Horace SEAVER, Kneeland's successor as editor, Mendum oversaw a new look for the *Investigator*, broadening its scope to appeal in particular to working-class readers interested in questions of labor relations and social reform (see LABOR MOVEMENT AND UNBELIEF; SOCIALISM AND UNBELIEF). Mendum also improved the *Investigator*'s publishing arm by publishing new editions of the works of great freethinkers like VOLTAIRE, Baron d'HOLBACH, Thomas PAINE, Robert TAYLOR, and Constantin Volney.

Mendum was particularly enamored of Paine, and was the main force behind building the Paine Memorial Hall on Appleton Street in Boston. Mendum raised most of the money for the project and was its guiding spirit (see MONUMENTS TO UNBELIEF). He eventually passed the property on to his son, Ernest, who went on to sell his interest in the property to Ralph Chainey. Ernest, who was named after the pioneering feminist and freethinker Ernestine L. ROSE, also inherited the *Investigator* from his father. Ernest maintained it until it was consolidated with *THE TRUTH SEEKER* in 1904.

A slightly built man who usually sported a neat, brown beard, Mendum married Elizabeth Munn in New York in 1847. In addition to Ernest, the couple had three daughters. Elizabeth Mendum died on April 13, 1872, and Josiah on December 10, 1891.

BILL COOKE

MESLIER, JEAN (1664–1733), French atheist and apostate. Jean Meslier was born in Mazerny, the Ardennes region of France. (Some early sources place this date as late as 1678, but later scholarship has found the 1664 date to be correct). Meslier's father, Gerard, was a wool merchant, and the family was somewhat prosperous. As such, and despite his misgivings, Meslier's parents convinced him to become a priest. In 1688 he was appointed to a parish in Etrépigny, in the Champagne district.

Meslier was the typical country priest of the time, supported financially both by his family (as was the custom) and by a small tithe from his parishioners. He was known for his honorable ways and his charity toward his parishioners. He had some difficulty with Antoine de Touly, the noble of the village where Meslier's church was located. This seems to have started as a personal quarrel over noble privileges, and eventually became a dispute of the nobility versus peasants generally. In caring for the members of his "flock" in this manner, Meslier demonstrated what might be considered a political concern for their general welfare; some scholars have seen in his attitude a harbinger of the French Revolution, which would occur sixty years after Meslier's death. Others have viewed him as a possible precursor to the writings of Karl MARX.

Meslier became "notorious" after his death, with the discovery of three handwritten copies of a book he titled *Mon Testament* (My Testament). In it he described his lack of faith and asked for forgiveness from his parishioners for not being more forthcoming about his views. Meslier explained that he was not strong enough to reveal his apostasy during his lifetime, and feared retribution. He discussed various aspects of Christian dogma, showing them to be invalid under scrutiny.

Apologist scholars have characterized this work as possible revenge upon the church, which sided with Touly during Meslier's various disputes with him. Others have sought to marginalize Meslier by showing that he had little (if any) impact on the church itself.

Meslier's name is attached to other works, adding to confusion as to what he actually wrote. A book appearing in 1774 and titled *Le bon sense* was linked to Meslier. This work was eventually attributed to the Baron Paul Henri Thiry d'HOLBACH, who had in fact written it, but by then a publisher had already retitled the work *Le Bon Sense du Curé Meslier*. A later translation of d'Holbach's work titled *Superstition in All Ages* also misattributed it to Meslier. This is probably the best-known work attributed to Meslier, though his only actual written work remains *Mon Testament*.

Others have made use of his ideas and portrayed them in different ways. In 1762 VOLTAIRE wrote *Extrait des sentiments de Jean Meslier*, which admixed extracts of Meslier's thought with Volatire's own deistic thought (see DEISM). Not until 1864, with *Le Testament de Jean Meslier* edited by Rudolf Charles, did the full text of Meslier's *Testament* see publication.

TIMOTHY BINGA

MIDDLETON, CONYERS (1683–1750), English deist author. Conyers Middleton was born December 27, 1683, and educated at Trinity College, Cambridge. He was a curate near Cambridge for a while before serving as rector of Coveney. In 1721 he was appointed librarian of Trinity College, and from 1731 until 1734 he was Woodwardian professor there.

Middleton spent his career trying to find a theology of rational belief that was entirely free of supernaturalism and "enthusiasm," the term then used to mean excitable evangelicalism. His career is a prime example of what is called theological lying. This is David Berman's term for the sort of dissimulation forced upon heterodox writers in the ages before freedom of the press. In order to escape censure, ostracism, and even torture and death, heterodox writers resorted to different forms of subterfuge to disguise their real thoughts while hoping to insinuate themselves to the discerning reader. This could be done by beginning one's work with some conventional piety, then criticizing the foundations of that same piety. It could also be done by criticizing some other faith tradition and leaving it to the reader to see that the criticisms applied to Christianity as well.

Suspicions about Middleton's orthodoxy began as a result of his *Letter from Rome* (1729), which outlined the significant debt Christianity owed to paganism. These suspicions were confirmed by Middleton's next important written work, the *Letter to Dr. Waterland* (1738). Waterland had written a conventional reply to Matthew TINDAL's *Christianity as Old as Creation* (1730). *Letter to Dr. Waterland* is ostensibly a rebuke of Waterland for not having argued against DEISM with sufficient thoroughness and vigor. And yet Middleton's arguments are far tighter and penetrating against Waterland's orthodoxy than against the deism both men feigned to oppose.

Middleton's best-known and least controversial work was an adulatory two-volume *History of the Life of M. Tullius CICERO* (1741). While not being particularly original, the work sold well, as Cicero was something of a hero to educated people of the eighteenth century.

Middleton's last and most substantial work had the revealing title *Free Inquiry into the Miraculous Powers*

which are Supposed to Have Subsisted in the Christian Church from the Earliest Ages (1749). Middleton was careful not to express his views openly, but his SKEPTICISM of most elements of supernaturalism, miracles in particular (see MIRACLES, UNBELIEF IN), caused a sensation. The ostensible target of this book was the Roman Catholic Church, but few failed to notice that Middleton's criticisms of Rome were just as relevant to Christianity in general. David HUME's work on miracles had appeared in the previous year, so Middleton's work reignited a significant controversy. Middleton died on July 28, 1750, just as controversy over his latest work was building.

BILL COOKE

MILL, JOHN STUART (1806–1873), English utilitarian philosopher. Born in Pentonville, London, John Stuart Mill was the eldest son of the Scot immigrant James Mill, who was chief examiner of the East India Company. James Mill was a member of a radical school of thinkers that included Jeremy BENTHAM, the father of utilitarian moral philosophy. J. S. Mill was a child prodigy, educated by his father beginning at a very early age. His father's stated goal was to mold the young Mill into a genius capable of carrying on the utilitarian tradition after his and Bentham's demise. By the age of thirteen, Mill was reading Greek and Latin so that he could master the classics in their original languages. By fourteen, he had mastered much of history, the classics, economic theory, and had completed significant work in logic and mathematics. At eighteen he edited major manuscripts of the Benthamites at the direction of his father; steeped in their works, he began his own literary career. In 1823 his father helped him get a junior position in the East India Company. He was eventually promoted to his father's position of chief examiner. He visited France in 1820 and became fluent in French, which influenced him in becoming a student of French philosophy and history. In 1826 Mill became suddenly and seriously depressed. His depression continued for a number of months, although he continued his work. He began to believe that the strict training his father had given him had repressed his capacity for emotion, educating his mind at the neglect of his emotional life. Mill found that reading Wordsworth helped cure his depression and encouraged his developing internal emotional life. He is most noted for his contributions to utilitarian moral philosophy, specifically in his work *Utilitarianism*, and for his defense of free inquiry and free speech in *On Liberty*, which is still a staple for most students of philosophy and political science.

Mill was a product of the British Enlightenment (see ENLIGHTENMENT, UNBELIEF DURING THE), and was heavily influenced by his personal relationship with Bentham and his readings of Auguste COMTE and Claude-Henri Saint-Simon. The influence of Saint-Simon and Comte are evident in Mill's *On Liberty.* Among Saint-Simon's historical theories is the notion of "critical" and "organic" phases of history. During "critical" phases, society is in the process of breaking down old structures and institutions, and during "organic" phases, societies undergo a process of rebirth, building upon new thoughts, philosophies, ways of life, and the like. It is clear that Mill believed that he lived on the cusp of one of those "organic" phases, and that his life and works were part of the process of rebirth. He devoted much of his work following his breakdown to an apparent attempt to reconcile the works of the world of REASON he was raised in with the world of emotion he found in poetry, and in his long friendship and marriage to Harriet Taylor. His relationship with Taylor was considered scandalous, given that it began while she was married, was extremely close for twenty years, and concluded in marriage after the death of her husband. Mill's and Taylor's response was to flaunt it and ignore criticism. Their free and open relationship clearly stoked and inspired his creative process.

As with much of his thought, Mill was influenced by his father in his views on religion. Mill wrote in his autobiography: "Growing Up without God. Those who admit an omnipotent as well as perfectly just and benevolent maker and ruler of such a world as this, can say little against Christianity but what can, with at least equal force, be retorted against themselves. Finding, therefore, no halting place in Deism, he [Mill's father] remained in a state of perplexity, until, doubtless after many struggles, he yielded to the conviction that, concerning the origin of things nothing whatever can be known [see DEISM]."

Mill was almost certainly an atheist or agnostic, though he took great care to hide his own views, perhaps out of a very real concern that they would undermine his other philosophical works in the court of public opinion (see ATHEISM; AGNOSTICISM). In fact, his publicly stated opinions did at one time indict him in a very real court (see LAW, THE, AND UNBELIEF). Nonetheless, Mill's views were clearly a bit more tolerant toward religious belief than were those of his father, of whom he writes further, stating: "As it was, his aversion to religion, in the sense usually attached to the term, was of the same kind as that of LUCRETIUS; he regarded it with the feeling due not a mere mental delusion, but to a great moral evil. He looked upon it as the greatest enemy of morality; first by setting up factitious excellencies, belief in creeds, devotional feelings, and ceremonies, not connected with the good of human kind and causing these to be accepted

as substitutes for genuine virtues; but above all, by radically vitiating the standard of morals, making it consist in doing the will of a being, on whom it lavishes indeed all the phrases of adulation, but whom in sober truth it depicts as eminently hateful."

Mill's own view of religion was that it might be saved for utilitarian ends. As with American Enlightenment deists, he viewed the proper role of religion as molding people into better citizens and encouraging moral behavior. Despite his indictment for engaging in public speculation as to the meaning of the Trinity, he saw Christianity as, at its base, a force for good moral teaching, though in practice something else entirely. Again, writing about his father in his *Autobiography*:

> I have a hundred times heard him say that all ages and nations have represented their gods as wicked, in a constantly increasing progression, that mankind have gone on adding trait after trait till they reached the most perfect conception of wickedness which the human mind can devise, and have called this God, and prostrated themselves before it. This *ne plus ultra* of wickedness he considered to be embodied in what is commonly presented to mankind as the creed of Christianity. Think (he used to say) of a being who would make a hell—who would create the human race with the infallible foreknowledge, and therefore with the intention—that the great majority of them were to be consigned to horrible and everlasting torment.
>
> The time, I believe, is drawing near when this dreadful conception of an object of worship will no longer be identified with Christianity; and when all persons, with any sense of moral good and evil, will look upon it with the same indignation with which my father regarded it. . . . The world would be astonished if it knew how great a proportion of its brightest ornaments—of those most distinguished even in popular estimation for wisdom and virtue—are complete skeptics in religion.

While rejecting the dogma of Christianity, he promotes a cultivation of the best parts of its moral code in his essay "The Utility of Religion." He further argues that belief in a supernatural power may have at one time been useful in maintaining such a moral code, but that it is now no longer necessary and indeed harmful.

Influenced as he was by his breakdown and subsequent emotional and poetic reawakening, Mill also writes of an aesthetic role of religion, writing in "The Utility of Religion": "Religion and poetry address themselves, at least in one of their aspects, to the same part of the human constitution; they both supply the same want, that of ideal conceptions grander and more beautiful than we see realized in the prose of human life." But his first two essays in "The Utility of Religion" argue further that the aesthetic and moral role of supernatural religion should be replaced with a religion of "humanity." The final essay in this work argues less stringently against the existence of God per se, in order to press the point of his positive humanistic goals (see HUMANISM). Mill argues that there is room for divine creation of the present imperfect world, and that this creation leaves room for the work of human beings to improve both the world and themselves. "If man had not the power by the exercise of his own energies for the improvement both of himself and of his outward circumstances, to do for himself and other creatures vastly more than god had in the first instance done, the Being who called them into existence would deserve something very different from thanks at his hands."

He concludes that faith is not rational in light of the lack of evidence of the supernatural, but he leaves open the role of religion in fostering "hope." Mill criticizes appeals to the alleged evidence of miracles, arguing that there is absolutely no evidence to support these claims. He admits only that a benevolent deity might have indicated its intent to award a life after death to those who aspire to it, but that if no evidence supports that, then one might still hope. He allows then that Jesus was Christ, and that He brought such a message of "glad tidings" for the hopeful.

Despite Mill's argument that the proper rational attitude toward supernatural religion is neither atheism nor agnosticism, he concludes in the last essay of "The Utility of Religion" that "the whole domain of the supernatural is thus removed from the region of Belief into that of simple Hope." In this light, Mill is best characterized as a humanist with, at most, deistic leanings.

DAVID KOEPSELL

MIRACLES, UNBELIEF IN. Two Theistic Approaches to Miracles. Traditionally, theism has moved in two seemingly opposite directions regarding miracles. One branch emphasizes local miracles as divine intervention for someone's benefit or punishment; miracles are heaven's wonderworks and revelations brought to earth. The other branch of theism views nature with its dependable regularities as the creator's perpetual revelation of cosmos over chaos; the *orderly* universe itself is the one great miracle of grace that makes life and daily existence possible. Local miracles, therefore, threaten the designed stability and predictability.

A Dilemma. A miracle requires supportive miracles that require still more miracles, with no conspicuous end to the proliferation. But if the proliferation does not end, the value of miracles declines and perhaps the very definition of *miracle* collapses. In the early eighteenth century Anglican bishop George Berkeley, doubtless seeing the problem generated by Roman Catholic miracle claims, advanced the following thesis: While God gave all human mortals experiences, including sensations, directly, they *arrived fundamentally in an orderly, coherent manner*. To this orderly input operating with regularity he gave the name *Nature*. Learning from Berkeley and the deists (see DEISM), the founder of Boston Personalism, Borden Parker Bowne, contended that if miracles broke with all law, they would be nothing intelligible. Furthermore, if the regular connections between human actions and their consequences were suspended by the proliferation of miraculous interventions, moral responsibility would go on a permanent holiday. Not even the most dedicated believer in miracles would find meaning in such unpredictable chaos.

For Bowne, miracles were more like signs guiding the mind to find meanings and connections it might otherwise miss: "[W]e cannot suppose them wrought at random and without reference to antecedents and environments." Whereas the deists conceived of nature as something of a vast and complex watch or machine operating more or less on its own and with its own laws, Personalists like Bowne, Peter Bertocci, and E. S. Brightman viewed God as operating *perpetually* through the laws and the regularities he designed. Scientists, evolutionists, and naturalists were, therefore, welcomed as investigators of the continuity of law and rational connection: "Even admitting a miraculous factor, we should not expect any such magical departure from all the psychological and historical uniformities and continuities." Just as the human senses must be tested by critical inquiry, so reports of miracles must be critically tested. Sound religion is not advanced by uncritically embracing claims of a speaking ass, a talking serpent, a floating ax head, a male's rib becoming a woman, or a prophet's riding a flaming chariot from earth to heaven. Supernatural causality works through natural means and method.

A Question of Definition. Theists like C. S. Lewis and Richard Swinburne believed that if an omnipotent creator could create the entire universe, he could surely perform local miracles. Much of this argument seems to be a definition that goes something like this: Omnipotent God is by definition a miracle-working being. Therefore, if he exists, he performs miracles. Since creation out of nothing is among the earliest miracles, all other miracles on earth follow as needed. But does it follow that this deity could perform miracles once he sets up his program? Could he, for example, create a Savior who was also a rapist? If by *Savior* is meant, among other things, a supremely moral being, then the answer is that he could not. Not all things are possible. Even for an omnipotent creator, any program always rules out numerous options. After creating and programming a being to be a donkey, could omnipotence make that being converse rationally in Hebrew with a human prophet? Is there a point beyond which the putative modifications render the original being no longer the same being?

Many Jews and Christians have learned to view supposed miracles in the Bible as literary devices for expressing insights—some profound, others mundane, and still others entertaining. Some scholars believe the miracles of the book of Acts, for example, function as ingredients of an entertaining novel like those found in ancient Jewish and Greek novels.

In many ways, Fyodor Dostoyevsky's treatment of miracles is more profoundly telling than is David HUME's. Examining miracles as a general category tends to generate entanglements and elusiveness, whereas focusing on specific miracle claims proves more fruitful. The narrator of *The Brothers Karamazov* notes that the youngest brother, Alyosha, believed not only in the elder Zosima's power to work miracles, but also that a coffin flew out of the church. By making it clear that Alyosha's expectation of miracles to follow upon Zosima's death was falsified, the narrator raises the question of whether Zosima's healings were really a supernatural cure "or merely a natural remission." There can be little doubt that Dostoyevsky, a member of the Russian Orthodox Church, was personally troubled about the miracle question. In March 1854, when he was thirty-three, he wrote the following to the wife of a fellow prisoner: "I am a child of this century, a child of doubt and disbelief, I have always been and shall ever be (that I know), until they close the lid of my coffin."

One Miracle Usually Requires Others. As is often the case, to support one miracle, others have to be brought in as support. Miracles proliferate with surprising quickness. According to Acts 7 (possibly written also by the author of the Gospel of Luke), Stephen the deacon was on the verge of being attacked because of a long, religiously incorrect sermon he had just delivered: "Being full of the Holy Spirit, [Stephen] looked up to heaven and saw (*eiden*) God's glory, and Jesus standing at God's right hand. Look [or Behold](*idou*), I see heaven open and the Son of Man standing at God's right hand" (7:55–56).

This interesting story raises some crucial questions. Did Luke himself think that if others present had looked up, they would have seen the Son of Man? In short, for Luke, was the Son of Man's standing at God's right hand publicly observable at that particular time and place, or was it a case of "faces in the clouds?" Did Luke mean to imply that he, Luke, personally believed that Stephen literally saw the heavens part, and saw the Son of Man standing literally at God's literal right hand? Or was he merely reporting, or at least telling a story, about a man named Stephen who only *thought* he was looking at Jesus (and possibly God) in heaven? In this putative

account, is Stephen's "seeing" the resurrected Jesus the same kind of "seeing" as those reported in the Gospel of Luke? According to Acts 10:9–13, while Peter was hungry and waiting for the meal to be prepared, he fell into a trance and "saw" heaven open. From it descended a large sheet (or perhaps a tablecloth) containing all kinds of four-footed animals as well as reptiles and birds. A voice then told him to get up, kill, and eat.

Did Luke mean to suggest that Stephen, too, had fallen into a trance or perhaps hallucinated, thinking he saw heaven open and Jesus standing at God's right hand? According to Acts 16:9–10, Paul had a "vision" during the night of a Macedonian begging him to come to Macedonia. The question naturally emerges: did Luke make any distinctions between visions, actual public appearances of someone, dreams, hallucinations, and trances? Can the words for "see" be used in all these cases? If so, how do they functionally differ? Of course, we are faced with Thomas HOBBES's question: *What is the difference between saying God spoke to someone in a dream and saying he dreamed God spoke to him*?

According to Acts 16:10, "After Paul had seen the vision, we got ready at once to leave for Macedonia, concluding that God had called us to preach the gospel to them." This is truly a revealing passage. Is it perhaps an ordinary dream *interpreted* to be a divine revelation? Furthermore, whereas only one person had the dream, *more than one* interpreted it to be a deity's specific instructions. Moreover, readers must make their own interpretations of what actually happened or did not happen, but their interpretations depend partly on Luke's interpretation of what he believed did or did not happen. Who told him about Paul's vision? Was it a secondhand report? Firsthand? Fourthhand? Did he believe it? Or was he writing with a specific agenda that gave him a storyteller's license?

Luke goes out of his way to give the resurrected Jesus a body of flesh and bone. But the flesh cannot be ordinary flesh, otherwise it could not travel through the stratosphere en route to heaven. Temperatures far below freezing would turn the fleshly body into a frozen block. So several supplemental miracles are required to prevent freezing. At the same time, the oxygen above three miles would become too thin for him to breathe; hence, suitable lungs and blood cells would become necessary to keep the brain reasonably intact.

All these adjustments can be made in the world of miracles, just as necessary adjustments occur in the world of Harry Potter. For the sake of the story, however, authors must draw the line on adding the supplemental miracles or works of magic. Every wonderwork requires an expanding network of supplemental wonderworks to make it possible within the story. The stopping point is somewhat arbitrary.

Auxiliary Hypotheses. Theories cannot be absolutely falsified *if* we are willing to pay the price of making numerous revisions and calling on numerous auxiliary hypotheses for reinforcement. Reinforcements, however, can sometimes become so heavy as to sink our home theory or revise it beyond recognition. Some aspects of our theories do sometimes appear to be falsified unless we make drastic revisions and corrections. The job is to keep track of the revisions and to keep a record of *the severe prices paid to keep them*. Sometimes, as we work from two or more models, we begin somewhere along the way to think that one model is more fruitful and intellectually promising. The other model seems less credible. Once believers step into the arena of miracles, they face the problem of their proliferation and thus the proliferation of hypotheses not only to account for each of them, but also to expose the presumed miracles in rival religions as pseudomiracles.

The Problem of Containment. B. B. Warfield hoped to persuade his fellow evangelicals that miracles had ceased during the Apostolic Age, that is, roughly the first century. For him, miracles after that century were merely counterfeit. Challenging Warfield, in 1993 Protestant author Jon Ruthven wrote a defense of the perpetuity of miracles. He did not intend to wrestle profoundly with the question of where to draw the line determining what is a genuine miracle and what is not, nor does he seriously address the proliferation problem.

Two Apostles Who Failed to Recognize Jesus. One of the most puzzling aspects of the resurrected Jesus narratives can be found in Luke 24:13–32. Although two apostles on the road to Emmaus meet the resurrected Jesus and converse and dine with him, they do not recognize him. This is a strange little story. Did its author mean to suggest that despite having only recently been two of Jesus's followers, they neither recognized his body with their eyes nor recognized his voice with their ears? If he did not look like Jesus or sound like him, how could they be sure he was not someone else? If Jesus had undergone a radical facelift, the story might at least have some internal plausibility. According to Matthew 28:9, however, two women, each named Mary, *recognize him instantly* and worship him, holding him by the feet. (On the other hand, according to John 20:14–16, Mary of Magdala did not recognize him at first but thought she was talking with the gardener.) Of course, Luke had a point to make, namely, that those two Emmaus apostles, one of them named Cleopas, were so "foolish" and "slow of heart" that they could not recognize him. They would have had to be also dull mentally.

Luke wanted to impress on his readers that Jesus's resurrected body was flesh and bones. The Greek word is *sarx* (flesh), not *soma* (body): "I am myself. Feel me and see. A ghost does not have flesh and bones, as you see I have" (24:39). Luke has Jesus eating fish to prove he is no ghost. The ancient Greeks faced the question of their gods' bodily fluid. In the *Iliad*, the gods, lacking mortal blood (*anaimones, haima*), possess a different humor (*ikhor*). Since the fluid passing so copiously through the veins of the gods was produced by what they ate, the

Greek gods had their special diet, namely, ambrosia. It is noteworthy that the Gospel of Luke in particular, while emphasizing Jesus's flesh and bones, says nothing about retrieving his blood, which was presumably spilled earlier.

Luke's flesh-and-bones Jesus can suddenly disappear from the Emmaus apostles' sight after breaking bread at their table and handing it to them (24:30–31). A similar disappearance might be affirmed in Luke 4:30, but the passage can be interpreted differently.

The Gospel of John tells the story of Mary of Magdala, who, upon eventually recognizing the resurrected Jesus, apparently grabs his feet or is about to. "Do not hold on to me," Jesus says, "for I have not yet returned to the Father" (20:16–17). After that, Jesus makes a quick trip to the Heavenly Father and then returns to perform the miraculous sign of appearing to the disciples, who are behind locked doors (20:19, 30).

Prayers and Sacrifices. Some theists and polytheists have believed their prayers carried something akin to lobbying influence that increased the controlling power's propensity to bestow miraculous interventions. PLATO regarded this aspect of prayer as a lack of real piety. Ironically, some cultures have ritualized or instituted sacrifices and prayers on a regular basis in the hope of securing the *order* of the universe. Conversely, in times of war, conflicting prayers for soliciting miraculous advantages for one's side and disadvantages for the enemy would seem to contribute to chaos rather than cosmos.

JOE EDWARD BARNHART

MIRACULOUS PHENOMENA. The Anglican writer C. S. Lewis defined a miracle succinctly as "an interference with Nature by supernatural power." Supposed miracles have been reported since the most ancient times, and ironically—even in our own relatively enlightened culture—they continue to be touted, especially among Catholics and evangelical Protestants.

Many claims involve supposedly miraculous relics—objects associated with a saint or martyr. So prevalent had relic veneration become in Saint Augustine's time (about 400 CE) that he deplored "hypocrites in the garb of monks" for hawking the bones of martyrs, adding with due skepticism, "if indeed of martyrs." His contemporary Vigilantius of Toulouse condemned the veneration of relics as being nothing more than a form of idolatry, but Saint Jerome defended the practice on the basis that God works miracles through them.

Among the "miraculous" relics of Catholicism is the much publicized "blood" of San Gennaro—Saint Januarius—in Naples. Januarius was supposedly martyred during the persecution of Christians by Diocletian, although the church has never been able to verify his existence as an actual historical person. In any case, since the fourteenth century what is represented as the martyred saint's congealed blood periodically liquefies, in apparent contravention of nature's laws.

While outside researchers have never been permitted to conduct definitive tests on the material in the sealed vial, two modern investigative teams have nevertheless proposed solutions to the mystery. One, by three Italian chemists, involves a thixotropic gel (made by mixing chalk and hydrated iron chloride with a small amount of salt water) that liquefies when agitated and resolidifies when allowed to stand. The other, proposed by forensic analyst John F. Fischer and Joe Nickell, uses an oil-wax-pigment mixture that liquefies at even a slight increase in temperature. Although the actual formula may never be uncovered, it is important to note that the "blood" has occasionally liquefied on its own, without the usual prayerful entreaties and under circumstances (such as repair of its casket) that would seem unlikely for the working of a miracle. Also, since the fourteenth century there have been several additional saints' bloods that liquefy—all in the Naples area and thus suggestive of some regional secret.

Even more macabre relics exist—among them the allegedly "incorruptible" bodies of saints, that is, corpses that have "miraculously" failed to succumb to decay. Actually, however, in many cases artificial means, such as wax masks, have been employed to conceal their poor condition. Some appear merely to have become mummified (fostered by tomb rather than earthen burial), or otherwise preserved (as by burial in lime-impregnated soil, which converts the body fat into a hard, soaplike substance that resists putrefaction). It should also be noted that many instances of alleged incorruptibility cannot be verified—or, more importantly, are disproved by the

facts, the bodies eventually being reduced to bones or requiring extensive restoration in order to be placed on view.

Another important category of miracle claims involves images that are said either to be supernatural in origin or to exude some magical power. Among the former are simulacra—images seen, Rorschach-like, in random patterns. A classic of the genre is an image of Jesus discovered in the skillet burns of a tortilla in 1978 (as still preserved at the New Mexico home of Maria Rubio). This was followed by similar "miraculous" images that appeared in such unlikely locations as the foliage of a vine-covered tree (West Virginia, 1982), rust stains on a forty-foot-high soybean oil tank (Ohio, 1986), and a forkful of spaghetti illustrated on a billboard (Georgia, 1991). As well, portraits of the Virgin Mary have been seen in such diverse places as the stains on the bathroom floor of a Texas auto parts store (1990) and in the grime on a window in an Italian village (1987). These appeared not to be anything more than the result of what one priest termed "a pious imagination."

Other notorious effigies are the "weeping," "bleeding," and otherwise animated icons that surface from time to time and raise troubling questions even for religious believers. For in shifting from the view that a statue is only a *representation* to the belief that it is truly *animated* is to seemingly cross a line from veneration to idolatry. Invariably, however, these are either investigated and found to be pious frauds or they are withheld from scrutiny. An example of the former was the statue of Our Lady of Fatima at a Catholic church in Thornton, California, in 1981. The sculpted virgin not only changed the angle of her eyes and tilt of her chin, reported churchgoers, but also wept, and even moved about the church at night. A bishop's investigation, however, found that the movement of the eyes and chin were apparently only variations in photographic images, while the weeping and perambulations were branded a probable hoax.

As the Thornton case indicates, allegedly miraculous photographs are quite common. A few of these are blatant hoaxes, while most are photographic "glitches" of one sort or another. As "Investigative Files" columnist for the *Skeptical Inquirer* magazine, this author received in 1995 some "miracle" photos from the popular TV series *Unsolved Mysteries*. My subsequent investigation showed that one was a "Golden Door" photo common to Marian apparition sites and thought by pilgrims to be proof of the doorway to heaven mentioned in Revelation 4:1; in fact, the effect was caused by the lens aperture of the Polaroid One-Step camera. Another photograph's "angel wings" were caused by light leakage into the film pack, and so on.

Some Christian fundamentalists place special emphasis on what are called "charismatic gifts of the Spirit" which include, notably, speaking in tongues, prophesying, and even (among a distinct minority) demonstrating imperviousness to fire and poisons, including poisonous snakes.

Speaking in tongues—known as *glossolalia*—is an ancient practice, mentioned in the New Testament (Acts 2:1–4) and recurring in Christian revivals through the ages. Modern analysis, however shows that it is actually "linguistic nonsense." William T. Samarin, professor of anthropology and linguistics at the University of Toronto, conducted an exhaustive five-year study of the phenomenon on several continents and concluded: "Glossolalia consists of strings of meaningless syllables made up of sounds taken from those familiar to the speaker and put together more or less haphazardly. The speaker controls the rhythm, volume, speed and inflection of his speech so that the sounds emerge as pseudolanguage—in the form of words and sentences."

Another charismatic gift of the spirit is prophecy. Early Christians mined the richly metaphorical ore of the Old Testament to "discover" therein supposedly prophetic passages of Jesus Christ as the Messiah. For example, Isaac Asimov points to a passage in Matthew—one absent from the other gospels—"[w]hich may well have arisen merely out of Matthew's penchant for interpreting and describing everything in accordance with Old Testament prophecy, ritual, and idiom."

Among modern prophecies, the most attention-getting ones are those that predict the biblical apocalypse or other doomsday scenarios. For instance, consider the prophecy made by the founder of the Church Universal and Triumphant, Elizabeth Clare Prophet. She predicted that the world would end in a nuclear holocaust, and her followers located themselves on a Montana ranch where they busily built nuclear shelters and stockpiled weapons. She frequently postponed the date of Armaggedon and explained each change as the result of fervent church prayers. Countless such cases have occurred throughout history, not only attesting to the failure of prophecy but also bearing witness to the credulity of religious zealots.

Taking up serpents is a practice of certain fundamentalist Christians (who read literally the passage from Mark 16:16–18, "they will pick up snakes in their hands") that is too extreme even for many ardent Pentecostals. The practice is actually part of a regular church worship that includes fervent preaching, singing, "witnessing," and speaking in tongues. While poisonous snakes are indeed dangerous and must be handled carefully, the knowledge the rural folk bring to the practice can be most helpful. For example, unless snakes are hot, hungry, or frightened, they move little and are relatively nonaggressive. Snakes raised from hatchlings can become accustomed to handling. Large snakes grasped behind the head will be unable to bite, and whenever they are lifted from the ground they usually will not bite.

In the event a participant is bitten, it is attributed to lack of faith. The devout forgo any medical help for snakebite, but that does not mean they forgo all treat-

ment, which may consist of rest, the use of ice packs, and elevation of the wound to slow the spread of the poison and thus lessen the shock to the body. Even so, some who are bitten do succumb, including, ironically, "the original prophet of snake handling," George Went Hensley, who died in 1955 of a snakebite sustained during a religious service.

The same biblical passage that refers to taking up serpents also promises, "if they drink any deadly thing, it shall not hurt them." This informs the custom among certain independent "Holy Roller" churches of drinking strychnine. This often precedes snake handling, which is interesting in light of the fact that strychnine has been advocated to treat certain physiological effects resulting from snakebite. It would appear that a healthy person could sip a little dilute strychnine without serious harm and that, in the event of snakebite, its presence could actually be beneficial.

"Fire immunity" is sometimes practiced by members of the Free Pentecostal Holiness Church, and it usually takes the form of holding kerosene lamps improvised from bottles to their hands or feet, or even their chests and faces. Credulous writer Scott Rogo was impressed by this "type of 'miracle,'" but in fact the fire handlers invariably place their flesh *beside* rather than *above* the flames, keep their hands moving when they pass through the fire, and otherwise apply well-known principles of physics—just like firewalkers and fire eaters throughout history have done.

Among Catholics, an impressive variety of phenomena are held to be miraculous, including stigmata and visionary experiences. Stigmata, the supposedly miraculous duplication of Christ's wounds upon the body of a Christian, typically take the form of wounds in the hands—less commonly the feet, side, and brow (as from the nail and lance wounds and punctures from the crown of thorns). Some writers believe the explanation for stigmata is an autosuggested effect, although experimental attempts to duplicate the phenomenon, as with hypnosis, have been ultimately unsuccessful. The most likely explanation for most cases is pious hoaxing.

Catholicism has a long tradition of visionary experiences, including that of a Mexican peasant named Juan Diego. In 1531 he was allegedly visited by the Virgin Mary, who caused her self-portrait to appear miraculously upon his cloak. Miraculists claim that beneath the paint on the obviously traditional portrait is the divine image.

Among the Marian apparitions in the twentieth century, only the visions at Fatima, Portugal, in 1917 were declared authentic. They were reported by three shepherd children, only one of whom—ten-year-old Lucia de Jesus dos Santos, a fantasy-prone child who frequently claimed to see angels and other apparitions and whose own mother described her as "nothing but a fake who is leading half the world astray"—talked with the Virgin. The events culminated on a rainy October 13 with an estimated seventy thousand pilgrims in attendance. Suddenly, Lucia directed everyone's gaze upward as the sun appeared from behind clouds, whereupon many experienced what is known in the terminology of Marian apparitions as a "sun miracle." The effects are varyingly described, but many say the sun performed strange gyrations—none of which actually occurred, as astronomers know. The effects were surely optical ones; for example, because one cannot focus on an object so bright, the eyes may dart back and forth, thus creating, by the effect of image and afterimage, the appearance that the sun is "dancing," or the eyes may attempt to focus, retreat, again attempt, and so on, thereby giving the illusion that the sun is "pulsating." Sun miracles are still reported at modern-day sites such as those which began at Medjugorje, in the former Yugoslavia, in 1981, and in Conyers, Georgia, in 1990.

Other reported phenomena include rosaries that reportedly turn to gold. Examinations of many of these show them to have acquired a yellowish tarnish or to have their silver plating worn off so that the underlying brass showed through. An even more remarkable claim came from Conyers, where statues with heartbeats were alleged. Asked to investigate these (and other effects) by an Atlanta television station, I found that there were no heartbeats detectable by stethoscope. Apparently people reaching up to experience the pulsations were feeling the pulse in their own thumbs.

One of the most significant of the Marian apparitions was that allegedly seen in 1858 by fourteen-year-old Bernadette Soubirous (now Saint Bernadette) at a grotto near Lourdes, a town in the foothills of the Pyrenees. Although the parish curé branded the affair a hoax, Bernadette's several visions culminated in her being directed to a hidden spring in the cave that had "healing" waters. Despite "multitudinous failures" over the intervening years (one such failure being Bernadette herself, who suffered for many years from tuberculosis of the bone and died at age thirty-five), a few cases have been certified as miraculous. Independent medical investigators have found otherwise, however, observing that virtually all of the diseases that were supposedly cured were those that were susceptible to psychosomatic influences and/or were known to show spontaneous remissions. Emphasizing the uncertain nature of Lourdes's power, French writer Anatole France visited the site in the late nineteenth century and said, surveying all the discarded crutches, "What, what, no wooden legs?"

Uncertainty is characteristic of faith-healing cases in general. Healing occurs naturally in the body and as many as an estimated 75 percent of patients would get better even if they had no medical treatment. That fact—together with spontaneous remissions, illnesses that have been misdiagnosed or simply misreported, and other factors, including psychosomatic illnesses and even outright fraud—helps to explain the apparent success of so many faith healings. Quite often, the apparent success is

short lived and follow-ups often reveal that the old condition has resurfaced. So-called faith healing can even be deadly if it causes people to reject medical treatment. This has happened in all too many instances, notably among adherents of Christian Science.

Of course one cannot prove miracles do *not* exist, but—apart from the well-known difficulty of proving a negative—one does not have that burden, which actually lies upon the claimant. Invariably, when we subtract the cases which have been clearly disproved, or that have plausible counter-explanations, or that are inadmissible because they cannot be substantiated, there seems insufficient grounds for invoking a miracle. Instead we see how easily people are deceived—not only by pious frauds but also by their own wish-fulfilling natures.

MONUMENTS TO UNBELIEF. Across the United States and the world, varied statues, graves, and historic sites—marked and unmarked—attest to the colorful histories of ATHEISM, AGNOSTICISM, SECULARISM, FREETHOUGHT, and related movements of unbelief.

No freethought figure is more lavishly memorialized than Thomas PAINE. At Paine's birthplace in Thetford, Norfolk, England, stands a statue erected in 1964 by the mid-twentieth-century US atheist leader Joseph LEWIS. The site of Paine's birth bears a plaque donated by the Thomas Paine Society. Thetford's public library contains a large collection of Paine items. At New Rochelle, New Jersey, where Paine long resided, a bust of Paine by Wilson MacDonald stands atop a marble monument owned by the city. Also at New Rochelle is Paine's cottage, site of a troubled museum. The cottage is owned and administered by the adjacent Huguenot Historical Society; the museum is operated by the Thomas Paine National Historical Association. At this writing, the museum is in poor repair, much of the association's board has resigned, and an effort by management to sell key Paine artifacts is under investigation by the attorney general of the state of New York. At Burnham Park, Morristown, New Jersey, stands a full-length Paine statue by Georg Lober, a 1950 gift of Joseph Lewis. (Lewis also prevailed on the socialist government of France in 1936 to accept a statue of Paine sculpted by Gutzon Borglum, sculptor of Mount Rushmore; the statue was not dedicated until 1948, and stands today in Montsouris Park, Paris.) The site of the house where Paine died in New York City's Greenwich Village is marked by a plaque. A bust of Paine adorns the Hall of Fame at New York University. Another, by sculptor Samuel H. Morse, is displayed in the library of the American Philosophical Society in Philadelphia. This bust was commissioned by a freethought organization, the NATIONAL LIBERAL LEAGUE, in 1876; sponsors hoped to place it in Philadelphia's Independence Hall in conjunction with that year's national centennial celebration. Religious opposition caused the bust's rejection. Remarkably, it languished in obscurity until the late 1960s, when it was acquired by the Philosophical Society. In 1997, a new Paine statue sculpted by Lawrence Holofcener was dedicated at Bordentown, New Jersey. In October 1992 the US Congress authorized the erection of a Paine memorial statue on the National Mall; private fundraising is ongoing.

The subject of the next largest number of memorials is doubtless Robert Green INGERSOLL. While he lived, a small town in Bowie County, Texas (near Texarkana), was briefly named for him. Ingersoll, Texas, grew up in the mid-1870s around a sawmill apparently operated by freethinkers who chose the community's name. After a Christian revival converted most of the residents in 1886, renaming was urgently sought. A newly dug well was yielding red water, so the townspeople dubbed their community Redwater. The Redwater, Texas, post office was officially renamed in 1894, five years before Robert Ingersoll died. More substantive memorials include Ingersoll's grave, Site Number 1620 in Arlington National Cemetery, Arlington, Virginia. Ingersoll began his law career in Peoria, Illinois; in that city's Glen Oak Park stands a full-length statue by Fritz Triebel mounted on a stone plinth. Ingersoll's widow and other family members attended its dedication on October 28, 1911. Two memorial plaques have adorned the Gramercy Park Hotel, constructed in 1924 on the site of Ingersoll's former New York brownstone residence. The original plaque was vandalized; it was replaced in 1988 but removed during a 2006 renovation. The mansion where Ingersoll died stands at Dobbs Ferry, New York. Originally the residence of Ingersoll's daughter Eva and her husband, the building bears no historical marker. At Chico Springs, New Mexico, an eccentric desert compound built by picaresque politician Stephen W. Dorsey still stands. Dorsey was one of two plaintiffs whom Ingersoll defended in the Star Route trials (1882), among the most sensational corruption cases of the late nineteenth century. Dorsey

"paid" for Ingersoll's services by making Ingersoll a partner in a cattle company and building for him a log cabin mansion of eccentric design on one hundred twenty acres of desert rangeland. Ingersoll lived there for two months in the fall of 1884, just long enough to decide that either the rancher's life—or having Dorsey for a neighbor—did not agree with him. In the next year Ingersoll was forced to sell out his position in the cattle company at a loss. The site now operates as a Dorsey museum. Once part of the Museum of New Mexico, since 1987 the Dorsey Mansion State Monument has been privately operated.

The best-known Ingersoll memorial is his birthplace, a small two-story frame house at Dresden in New York's Finger Lakes district. Ingersoll lived there only for the first four months of his life. Twice the birthplace was restored—in 1921, and again in 1954 by Joseph Lewis—only to fall into disrepair. Near collapse in 1986, the house was purchased by the Council for Democratic and Secular Humanism, which raised $250,000 to rehabilitate the structure. On Memorial Day weekend in 1993, the Robert Green Ingersoll Birthplace Museum opened to the public as America's only freethought museum; it has been open each summer and fall weekend since. The museum's holdings include numerous Ingersoll artifacts and what is believed to be the most complete collection of printed works by and about Ingersoll.

In the nineteenth century, west-central New York State was a cauldron of social, political, and religious ferment—the Southern California of its age. The US woman suffrage movement (see Woman Suffrage Movement and Unbelief), Spiritualism (see Spiritualism and Unbelief), and the Mormon and Seventh-Day Adventist churches all originated there. The region is so rich with freethought sites that the Council for Secular Humanism (as the Ingersoll Museum's operator has been known since 1996) established an informal Freethought Trail of marked and unmarked sites within two hours' drive of Dresden.

Suffrage landmarks include the site of the 1848 Women's Rights Convention, wellspring of the suffrage movement. Part of the Wesleyan chapel in which the event was held still stands in downtown Seneca Falls; it is now a National Historic Park with an impressive adjacent museum established by the US Park Service. Most leaders of the women's rights movement were freethinkers, including Elizabeth Cady Stanton, Susan B. Anthony, and Matilda Joslyn Gage. Stanton's Seneca Falls home has been lavishly restored by the Park Service. Anthony's home in Rochester is a privately owned museum. The Gage home in Fayetteville is being restored by a foundation under the leadership of feminist historian Sally Roesch Wagner. It intermittently displays its holdings and hopes to establish a museum.

Other Freethought Trail sites include Elmira, where a statue of Mark Twain (see Clemens, Samuel Langhorne) and the octagon study in which he wrote many of his novels stand on the campus of Elmira College. Twain's grave lies in Elmira's Woodlawn Cemetery. The Syracuse home of abolitionist and regional freethought leader C. D. B. Mills, father of prominent suffragist Harriet May Mills, is undergoing restoration. The mansion of Andrew Dickson White—first president of the first secular university in the United States, Cornell, and the accidental immortalizer of the "military metaphor" of warfare between science and theology—stands on Cornell's Ithaca campus. It houses academic offices.

One of the richest locations along the Freethought Trail, though it contains no marked sites, is the village of Watkins Glen. Watkins, as the village was then known, was the site of the New York Freethinkers Convention of 1878, despite its name a national gathering. There D. M. Bennett, publisher of the influential freethought paper *The Truth Seeker*, was arrested with two others for selling Ezra Heywood's sex manual *Cupid's Yokes* (see also Sex Radicalism and Unbelief; Comstock, Anthony, and Unbelief). The arrest became a national cause célèbre that would come to involve figures including Ingersoll and US president Rutherford B. Hayes. Outdoor portions of the convention were held at the village park, which still exists along Fourth Street; indoor portions were held in a meeting hall that stands on the southeast corner of Fourth and Franklin streets. This was the site of Bennett's arrest. The impressive stone building is in fairly good repair. The upper floor, site of the meeting hall, is unoccupied; the ground floor houses several busy local restaurants. Indeed, the entire village center retains strong echoes of its nineteenth-century appearance. Armed with Bennett's *Truth Seeker* account of his arrival at Watkins by train, one can walk the eleven blocks down Franklin Street from the lakeside rail station (now also a restaurant) and past the meeting hall to Watkins Glen State Park. Many of the landmarks Bennett described remain recognizable, particularly the town's spectacular, eponymous gorge, which remains substantially as it was when Bennett toured it; his account is as good a guide to its uncommon rock formations and waterfalls as anything one might purchase at the park's gift shop.

Sites across the country memorialize the so-called Forty-Eighters, liberals and *freidenkers* (freethinkers) who fled Germany after the failed democratic revolution of 1848. Thousands settled in Wisconsin, Minnesota, Kansas, Missouri, and Texas, then undergoing rapid settlement. Opposed to slavery, *freidenkers* leapt into the controversies preceding the US Civil War; some historians believe *freidenker* agitation was critical in ensuring that Kansas entered the Union as a free rather than a slave state in 1861.

Thomas Cemetery, near Fergus Falls, Minnesota, is a rare freethinkers' cemetery, containing mostly remains of German *freidenkers*. Wisconsin sites include a Freethought Hall at Sauk City, now a Unitarian meeting hall, and a disused Freie Gemeinden (Free Congregation) hall on Jefferson Avenue in Milwaukee. A Freie Gemeinden hall at Dodier Street and Florissant Avenue in

St. Louis now serves as a community center. At Hermann, a German-American town in central Missouri, journalists Charles Strehly and Eduard Mühl published the German-language newspapers the *Hermanner Volksblatt* and the freethought paper *Licht Freund* (Friend of Light). Both were regionally influential voices of abolition and ANTICLERICALISM. Strehly's house stands and bears a historical marker. In 1880 poet-lawyer George Henry Walser established the "freethought town" of LIBERAL, MISSOURI, whose charter forbade the erection of churches or saloons. Though the town's nonreligious character did not survive the turn of the twentieth century, Liberal endures complete with streets named for Ingersoll, Paine, Charles DARWIN, and other freethought heroes. One educational institution from Liberal's heyday, the wholly secular Liberal University, survived into the twentieth century. In 1897 it moved to Silverton, Oregon, where it operated for a few years under the leadership of Thaddeus Burr WAKEMAN, also publishing the newspaper the *Torch of Reason.* At some point the institution moved to Kansas City, apparently expiring in 1903. At Silverton, one of the buildings used by the university survives, a large brick structure in the central business district.

Freidenkers also settled the Texas hill country, establishing Utopian socialist communities at Sisterdale, Boerne, and Comfort. A *freidenker* memorial at Comfort became a local bone of contention. In August 1998 a fifteen-foot stone monument or cenotaph acknowledging the *freidenkers* as Comfort's founders was installed in the town park. The monument had the approval of civic and public authorities, complete with a marker furnished by the Texas Historical Commission. Outraged Christian fundamentalists forced the town's chamber of commerce and its heritage foundation to reverse their previous support. The cenotaph was removed from the town park by a private contractor in December 2000 and dumped a few miles outside Comfort. After an interval it was installed on private property in the town's historic district.

Gravesites of freethinkers include the grave of D. M. BENNETT in Brooklyn's Green Wood Cemetery. *Boston Investigator* founder and birth control activist Abner KNEELAND (see BIRTH CONTROL AND UNBELIEF) was buried on his Iowa farm; in 1881 his grave was moved to a cemetery in nearby Farmington, its current location. The grave of Frances WRIGHT in Cincinnati's Spring Grove Cemetery bears an impressive monument that was restored in 1997 by the Feminist Caucus of the American Humanist Association, the Freedom From Religion Foundation, and the Free Inquiry Group of Cincinnati and Northern Kentucky. The ashes of Moncure CONWAY are interred in Kensico Cemetery at Kensico, New York.

Visitable graves of British freethinkers include those of Richard CARLILE and Henry HETHERINGTON in Kensal Green Cemetery, London; Carlile's grave is ill marked. Highgate Cemetery, London, contains the graves of numerous freethinkers including George Jacob and Austin HOLYOAKE, William Kingdon CLIFFORD, and Charles WATTS, as well as the grave of Karl MARX. Charles BRADLAUGH and William Stewart ROSS (Saladin) lie in the Nonconformists' section of the Brookwood Necropolis southwest of London. Thomas H. HUXLEY is buried in Marylebone Cemetery, Finchley.

Perhaps the best-known London building associated with unbelief is Conway Hall in Red Lion Square. It was built in 1929 to replace the South Place Chapel, whose facade was preserved in its construction. A handsome bust of Bertrand RUSSELL adorns Red Lion Square, the publicly owned courtyard outside. Conway Hall remains home to the SOUTH PLACE ETHICAL SOCIETY and the headquarters of the NATIONAL SECULAR SOCIETY.

Several unmarked locations near Fleet Street have freethought associations. The west corner of Fleet Street with Bouverie Street was the location of Carlile's shop, where he printed the books and magazines that sparked his various arrests. Carlile and Robert TAYLOR lectured at the Rotunda, which stood on Blackfriars Road at the corner of Stamford Street. Johnson's Court, a small street running between Fleet Street and the Samuel Johnson house, was for many years the site of the RATIONALIST PRESS ASSOCIATION's offices. George W. FOOTE's Progressive Publishing Company, at which the *FREETHINKER* magazine was founded, stood at 28 Stonecutter Street, another tiny lane off of Fleet. All these sites are occupied by newer buildings.

Two London sites of freethinker imprisonments can be visited. Off of Holloway Road stands the Holloway Gaol, where Foote served a year for BLASPHEMY. The Giltspur Street Compter (jail) at the corner of Giltspur and Newgate streets, where Carlile served several years, has been demolished; the site is marked by a plaque.

A life-size statue of Bradlaugh stands in the public square in Northampton, which he long represented in Parliament.

Though much diminished, the historically significant LEICESTER SECULAR SOCIETY continues to occupy its own building at Humberstone Gate, Leicester. Most of the building is rented out to non-freethought tenants.

In Australia, Joseph SYMES's Hall of Science in Melbourne remains almost wholly intact; now called Brenan Hall, it is an annex of Saint Vincent's Hospital. Ironically its survival is due to Melbourne's early twentieth-century Roman Catholic archbishop, who acquired the building circa 1913 and incorporated it into the expanding hospital. In Sydney, the former Freethought Hall or Lyceum still stands, now housing law offices.

The New Zealand Association of Rationalists and Humanists continues to operate from Rationalist House at 64 Symonds Street in Auckland. The 1912 building, originally a doctor's residence and surgery, was acquired by the association in 1960. In 1997 the building was named a Heritage Site by the Auckland City Council. The nearby Symonds Street Cemetery contains the grave of Charles SOUTHWELL.

Also noteworthy are a statue of Giordano BRUNO in

Rome's Piazza del Flora, where he was burned at the stake in 1600; and a very large statue of David HUME (for some reason portrayed wearing a Greco-Roman toga) unveiled in Edinburgh, Scotland, in 1997.

TOM FLYNN

MOORE, CHARLES CHILTON (1837–1906), American atheist publisher. Charles Chilton Moore received his early education at small schools in Kentucky, and from tutors. Eventually he attended Bethany College in Virginia, where upon graduation he was ordained to the ministry by Alexander Campbell, founder of the Disciples of Christ sect. Moore then began a two-and-a-half-year itinerant ministry in the mountains of eastern Kentucky, finally returning home to his widowed mother.

He met William J. Hatch, a Confederate soldier who was a distant kinsman. Hatch was scholarly and skeptical about religion (see SKEPTICISM), so Moore proposed that they make a study of the evidences for and against Christianity, which they did for six weeks, ten or twelve hours a day. The intense study caused Moore to become gravely ill of a fever, bedridden, unable to walk or sleep. As a result of his studies, Moore lost his faith in the Old Testament, and resolved to preach only from the New Testament.

He accepted a pastorate at the Christian church in Versailles, Kentucky, but eventually had to resign when further study caused him to discard the New Testament as well. At this time Moore was a deist; he later became an agnostic and finally an atheist, which he considered to represent the most advanced thought of the age (see DEISM; AGNOSTICISM; ATHEISM). Moore worked on the farm for a while, and then at various jobs in mills and banks, and even sold coffee for a year and a half.

He became a newspaper reporter, but was repeatedly dismissed by editors for his outspoken views against liquor and religion.

One night while walking home from Lexington, Moore decided to start his own paper so that he could say just what he wanted to. Thus was born the *Blue Grass Blade.* Early issues focused largely on alcohol prohibition with some FREETHOUGHT material; later issues were more centered on freethought with some prohibition articles. Moore's first book (1890) was *The Rational View*, a scholarly refutation of the Bible and theism in general.

In 1899 Moore was indicted for sending obscene material through the mails because of articles on marriage published in the *Blade.* He was accused of promoting free-love, which he abhorred (see SEX RADICALISM AND UNBELIEF); after a farcical trial, he was sentenced to two years in the federal prison in Columbus, Ohio. The real and unspoken reason he had been prosecuted was his atheism. After hundreds of petitions were sent to President William McKinley, Moore was pardoned after serving only five months. He came home to a hero's welcome; more than five hundred persons greeted him. While in prison, Moore wrote *Behind the Bars: 31498*, (1899—"31498" was his prisoner number), which is largely autobiographical and rich in Kentucky history.

In 1903 Moore embarked on a trip to the so-called Holy Land, his goal being to write a detailed exposé of the locales at which Bible stories had supposedly occurred, from the spot on which Lot's wife purportedly still stood to Jesus's tomb and the site of his alleged ascension. Moore felt that Mark Twain had made some exaggerations in his best-selling *Innocents Abroad* and wished to set the record straight. Moore also had much to say concerning the Muslims then in control of all the Christian artifacts and sites. The result was his final book, *Dog Fennel in the Orient* (1903).

In the fall of 1905, Moore developed congestive heart failure, from which he suffered greatly, dying on February 7, 1906. Well over a thousand people attended his funeral, at which the prominent freethinkers Josephine K. HENRY and J. B. Wilson delivered addresses.

MICHAEL ADCOCK

MORALITY FROM A HUMANIST POSITION. John Stuart MILL had a deep understanding of morality, in particular the centrality to it of consequence, of happiness,

and of (broadly speaking) "virtue." But he could not solve two basic problems. First, happiness cannot be the goal of moral action, because happiness is not always morally good: consider the successful confidence trickster. Second, the happiness of one individual is often incompatible with that of another; who should get the happiness? Mill acknowledged that pleasures can be graded as "higher" or "lower." But he provided no acceptable criterion for this evaluation; in the end, only total quantity counted in the utilitarian standard "the greatest amount of happiness altogether." This cannot be accepted for two reasons: first, there is no adequate basis for the quantification of happiness, or for its summation over many individuals; second, it allows the imposition of iniquitous suffering on one individual if sufficiently many benefit.

But Mill's basic idea was right: "Happiness is desirable, and the only thing desirable, as an end." Aristotle was looking in the same direction. He described *eudaimonia* as the "best, noblest, and most pleasant thing in the world." *Eudaimonia* was translated "happiness," now more usually "well-being." It is clear that the words *happiness*, *pleasure*, *satisfaction*, *well-being*, and *eudaimonia* point in various ways to the "good state." This is complex and ambiguous in human beings.

There are two problems. First, there is a fundamental ambiguity in the idea of "good": does it mean "good according to the person who enjoys it," or "good according to some external standard, such as morality"? No fundamental analysis of morality can simply assume an external standard; any standard must be justified. Thus, if "the good state" (for a person) is assumed as basic, it must be taken in the sense "good as self-evaluated." "The good state" in the sense "good as moral" requires further definition and justification. The second problem is that all the words that might be used here suffer pejorative overtones of superficiality or "mere hedonism." This is unfair, and corrosive of moral understanding. An individual's "happiness" may be critically dependent on the happiness of another person, and it may be guided by ideals and moral values. The concept is vital to us, but there is no "clean" term to express it.

The first of these problems can be resolved by stipulative definition: I use *happiness* to refer to whatever the individual feels as happiness. "Morally acceptable happiness" has a *moral* quality, whatever that is. Human good lies in *morally acceptable* happiness. As to the second, I just ask the reader to reject pejorative overtones.

Morality is the expression of concern for the good of other people. It is an amazing thing: How can it be that human beings find such odd ideas *important*? The only possible answer is that human beings have certain powers and propensities that led them to construct *ideas about* morality, and to feel the importance of these ideas. But these powers and propensities develop very differently in different communities. Has any community got "moral sensibility" right? I will show that there are objective criteria defining moral sensibility; and that proper deployment of these powers and propensities will lead us to *true* moral sensibility.

What Is Morality? No explicit definition is possible. Morality is, rather, defined implicitly by the moral aspiration, which characterizes the ideal of moral action:

> The ***Moral Aspiration***: That my actions should be guided by principles and supported by adequate understanding of the situation. The principles should express a concern for individuals that excludes no individual, and treats each fairly, insofar as this is possible in the situation. The criterion for the "fair" treatment of individuals should carry compelling importance. (This departs considerably from Rachels, but was inspired by him.)

My object is to pick out premises that are manifestly valid, and to construct a theory of morality that will affirm the principles of morality.

> *I here consider the morality of an action in abstraction from the morality of the agent in acting thus. Both are determined by the way things are, including the evaluations and agent-centered prerogatives of those involved. Neither is constrained by limitations to human knowledge.*

> **What Is Humanism?** I here require only three key points.

> ***Humanism*** claims: (1) The universe is naturalistic. (2) The principles of moral action derive from certain attributes (including evaluations) carried in human nature. (3) The importance of moral action derives from, on the one hand, the importance of individuals and of their happiness and suffering; and on the other, the significance of the human ability to respond meaningfully to this importance.

> The universe is ***naturalistic***: Values, purposes, and meanings derive only from evaluations by, and intentions of, natural beings.

> A ***natural being*** is a being capable of consciousness and limited by a material body.

This definition of *naturalistic* does not limit value to things actually evaluated by a natural being: It includes values that "derive from" the evaluations of natural beings. If one thing is valuable, and there is something that protects or secures that thing, then the second thing acquires value from the value of the first, whether the original evaluator recognizes it or not.

All meaningful ideas of God see him as not limited by a material body, and they also see him as valuing us and our actions. Therefore, if the universe is naturalistic, then

there is no meaningful "god." This premise also excludes an ontologically independent realm of values, such as the Platonic "the Good."

> Human beings have a propensity to develop a moral sensibility, not because it gave our forebears selective advantage, but because evolution gave us certain attributes each of which confers selective advantage. These together, if developed properly with intellectual and emotional effort, will lead us to the beliefs, evaluations, and propensities that constitute moral sensibility.

Developing Moral Theory: The Basis. People have beliefs and evaluations, mental capacities and dispositions; I will refer to these collectively as their "attributes."

"Morality" is a meaningful idea for normal human beings only because they have certain attributes. These lead people to a concern for other people's happiness and a concern for fairness, and these attributes also lead people to develop understanding of how people feel happiness, and of the logical and practical difficulties in this. And further, normal human beings have a tendency to develop their concern for people according to their understanding. This much is obvious. The following argument develops these points. It seems to me obvious that the general achievement of happiness will be enhanced if the level of understanding, and the degree of concern, increase. Therefore, *very broadly speaking*, it would be a good thing to increase understanding and concern: it is *morally* good to do so. To turn this idea into a fundamental theory of morality requires some further very general premises, and in particular an assumption concerning the sources of evaluation in the universe.

My analysis will follow an idealized moralist who is engaged in developing moral theory. I assign her the female gender, and give her the proper name ***Moralist***. At the start of her theorizing she has the moral aspiration, and she has the attributes, *to perfection*, which will enable her to understand the facts and evaluations which are relevant, and to draw valid inferences. So the judgments she will develop will fulfill the moral aspiration. They will be valid moral judgments. Further, Moralist has the evaluations implicit in the above, and no other evaluations. Unlike actual human beings, she has no personal values. Therefore her evaluations will express evaluations that are purely moral. This theoretical "perfect person" is an abstract aid to inquiry, rather like the physicist's idealized "frictionless pulley," or the Carnot Cycle. She does not exist in the real world.

The development of Moralist's theory expresses the development of her moral understanding. First she discovers the fundamental moral principles; then she applies them to particular situations. The fundamental principles depend on how things are in certain very general respects: in particular, the character of human nature, and the reality or otherwise of a god. We ordinary human beings can reproduce Moralist's derivation of the fundamental principles. We cannot follow her analysis of particular situations; but her theory illuminates practical morality for us, and we can apply it, subject to our limitations.

The structure of Moralist's theorizing is determined by the fact that the principles of morality are defined by conditions they must fulfill, stated by the moral aspiration, and not defined in any explicit sense. Moralist must find an explicit identification. Her analysis may be compared with an algebraist finding a number defined by an equation that must be solved. The algebraist uses x to represent the unknown number that fulfills the equation. Moralist uses "moral concern" as her unknown:

> ***Moral concern***: A concern that values the happiness and suffering of every individual as important, guided by principles of action that fulfill the criteria of the moral aspiration.

The algebraist and Moralist use these terms (x and *moral concern*) without knowing what they refer to. At the end of their analyses, the algebraist will have identified the number that fulfils the equation and Moralist the principles of action that satisfy the moral aspiration.

The critical point about Moral Concern is that it includes the principles of action that satisfy the Moral Aspiration. But Moralist introduces it as a hypothesis, without the principles of action being specified. She must identify them.

The first step in Moralist's analysis is to recognize that there are certain attributes any individual must have if those of his or her enterprises which do not involve moral considerations are to be effective:

> The ***Basic Attributes*** are those of the mental attributes established in the species nature of human beings that an individual must have if he or she is to achieve any of his or her desires that do not involve moral considerations.

> It is not relevant for me to list the Basic Attributes, but these are clearly essential:

The ***Basic Attributes*** include: (a) a drive to achieve knowledge; (b) a capacity to interact with reality, and to describe aspects of it and to recognize the significance of those aspects which are relevant to the fulfillment of one's desires (as I am here assuming humanism, Moralist will not discover any nonnaturalistic reality); (c) a capacity for understanding people's feelings (sympathy is here excluded); (d) a capacity to understand general principles; (e) a capacity to draw inferences from factual and evaluative statements; and (f) a drive to achieve coherence between one's knowledge, one's values, and one's life.

Each of these is necessary if one is to be successful in enterprises involving other people. But they are not sufficient to realize morality. A *concern* for other people's feelings is also essential. An understanding of another person may equally be used to exploit them and to benefit them. Normal human beings are born with a propensity to develop realizations of the basic attributes: Attributes (a) and (f) drive the development of human understanding and values, while (b), (c), and (d) guide it. Attributes (a) to (e) give knowledge. Attribute (f) leads one to internalize one's cognitive understanding of moral values. Internalization is critical; it is lacking in burglars. Burglars may know that theft is wrong, but they have not internalized the evaluation. Moralist therefore has a double development—of knowledge and of evaluations "internalized."

Ordinary people develop their beliefs and evaluations informally; often they "feel" things, and often they introduce false premises and invalid inferences. Thus they generate their personal "moral" values. Moralist is an ideal: She possesses the basic attributes to perfection, and also a concern for people, not merely understanding. Further, as she is a theoretical concept, I can give her the capacity to acquire knowledge of the particular facts and evaluations relevant to a particular situation. Thus her evaluations truly are *moral* evaluations, general and particular.

Developing Moral Theory: Argument. *The argument is based on five moves, which introduce matters of moral and factual substance*. These give the premises for Moralist's argument. She numbers conclusions that express knowledge gained; and she adds a star to conclusions, which express her evaluations, for example, (5*).

Moralist first considers moral sensibility. Its definition is:

> ***Moral Sensibility***: Those attributes that lead a person to act morally.

Moralist must identify the attributes that constitute moral sensibility. The concept may be taken in two ways: referring to the attributes that a normal human being has, well or ill developed, which lead him or her to behave more or less morally; and referring to the ideal.

Moralist defines these as ***Ideal Moral Sensibility*** and ***Personal Moral Sensibility***, respectively.

The first move: Moralist identifies Ideal Moral Sensibility in terms of moral concern (as yet unidentified) and the basic attributes.

Moralist first defines a concept that brings together the basic attributes and concern. This is a theoretical concept that applies only to ideal individuals who have the power to acquire perfect knowledge of particular facts and evaluations.

> The ***Perfected X Attributes***: (1) moral concern; (2) the basic attributes extended by the ability to acquire perfect knowledge of particular facts and of the evaluations made by ordinary individuals; and (3) attributes this ideal individual develops by his application of (1) and (2). This process also leads to the rejection of some attributes.

"X" reminds us that the concept carries moral concern, as yet unidentified.

An action that satisfies moral concern is a moral action. Then (1) below *follows tautologically from* these definitions.

> **(1)**: An individual with the perfected X attributes would know the facts appropriate to his or her situation, and evaluate them morally. Basic attribute (f) would then lead him or her to act morally.

The attributes that constitute the perfected X attributes constitute the attributes that constitute perfect moral sensibility. Because the latter attributes are defined as the attributes which lead an individual to act morally; and (1) establishes that possession of the former attributes would lead an individual to act thus.

> **(2)**: The perfected X attributes constitute ***Ideal Moral Sensibility***.

The second move: Moralist defines Personal Moral Sensibility.

> Ordinary human beings are endowed with the Basic Attributes, and also an unsophisticated concern for other people, as against Moral Concern. All too often, people develop their basic attributes with improper assumptions and muddled thinking. But people usually learn some sort of "personal moral sensibility" Moralist therefore establishes a weaker form of (1).

> **(3)**: Insofar as the evaluations and beliefs of an individual are *compatible with* Ideal Moral Sensibility perfectly developed for his or her situation, and include feeling the importance of satisfaction and suffering, and no other attributes cancel them, he or she will *tend to* act morally.

> **(4)**: Insofar as an individual's attributes fulfill the conditions specified in (3), those of them that contribute to this constitute his ***Personal Moral Sensibility***. I will omit "personal" where the context makes the qualification clear.

The third move: Moralist derives an evaluation. She first derives a cognitive conclusion from (3) and (4), using an implication of the definition of a "morally good" action: "It is morally good for a person to have attributes that lead him or her to moral action."

(5): It is morally good that an individual should have well-developed personal moral sensibility.

Such an individual will be more likely to act morally. Moralist's basic attribute (f) then leads her to accept this evaluation into her own evaluations:

(5*): It is good [i.e., moralist feels it to be good] that an individual should have well-developed personal moral sensibility.

(5*) suggests that it would be good to enhance the development of an individual's moral sensibility; but this does not follow. Such an action would have good consequences for other individuals; but would it be *fair* to the individual who suffers education? The Moral Aspiration requires that discrimination be justified by a *fair* criterion.

A standard for discrimination is ***fair*** if and only if:

(1) the necessary attributes can be acquired by a normal individual; (2) the standard is of adequate significance; (3) it can be recognized as such by normal individuals; and (4) it is impartial between individuals. Further, the criteria must be applied with sensitivity to human limitations.

The fourth move: Moralist recognizes that the attributes that constitute moral sensibility have the necessary significance to be the standard for *fairness*:

(6*): The human capacity to develop an effective personal moral sensibility can enable the general enhancement of human and animal flourishing. It therefore has an all-inclusive importance. These attributes when developed are the supreme expression of our humanity.

Therefore:

The degree of development of an individual's moral Sensibility, compared against ideal moral sensibility, is a ***morally fair*** criterion for discrimination in respect to him because: (1) Normal human beings can develop a degree of moral sensibility; (2) (6*) establishes the all-inclusive importance of moral sensibility as a human attribute; (3) normal human beings are born with a propensity to recognize its special importance; and (3) the ideal of moral sensibility does not involve the particularities of any individual.

The morality of an action depends on its outcome. Moralist can now define two categories of morally acceptable outcome. There are two ways in which one may benefit a group of individuals: by giving satisfaction to one of them, without damaging any of the others; by making one individual a better person (without being unfair to him or her), for then he or she will be more likely to benefit the others. (I simplify by supposing that only one individual is directly affected.) These alternative outcomes may be expressed more accurately:

(7*): If an individual's having a certain satisfaction is not implicated in prejudice to the moral sensibility of any individual (the given individual or any other), then it is in itself good.

(8*): If enhancing the moral sensibility of an individual does not involve denying him or her satisfaction disproportionate to the inadequacy of his or her moral sensibility, then it is in itself good.

Moral Satisfaction: A satisfaction that fulfills (7*).

Each of these outcomes expresses concern for members of the group. Each benefits one or more of the group without disbenefiting the others unfairly (insofar as the situation allows): each therefore is in itself good. But each excludes the other individuals, giving them no benefit. Fair application of both over time would not exclude any.

Moralist now poses the question: *Are (7*) and (8*), together, adequate?*

The fifth move: Humanism: The Sufficiency of the Natural World. *Moralist* employs a premise of the life stance within which the moral theory lives. In this article, humanism is assumed and Moralist therefore accepts that the universe is naturalistic. Therefore, moral evaluations derive from the evaluations and the attributes of natural beings, they are discovered by our ordinary faculties, and there is no God to give us knowledge or practical support. Therefore human beings do not require a specific faculty to discover moral evaluations. Further, it seems that moral sensibility is the only human attribute of such importance that achieving its enhancement or preventing its prejudice justifies discrimination. Finally, it is generally accepted that no individual human being or collection of human beings has the authority to establish moral evaluations. Therefore:

(9): **(a)** The Basic Attributes ideally strengthened, with a concern for all individuals, are sufficient for developing the principles of action for guiding moral judgments. **(b)** (7*) and (8*) are valid moral principles; for moral sensibility is the only ground which is adequate for rejecting an individual's happiness. **(c)** There are no further fundamental moral principles; for there are no other attributes independent of moral sensibility that could be relevant.

Therefore:

(10): (7*) and (8*) are the ***fundamental principles of morality***. They constitute the evaluative principles called for by the moral aspiration.

Moral concern can now be set out explicitly in terms of (7*) and (8*).

> ***Moral concern:*** A concern which values the happiness and suffering of every individual as important, guided by (7*) and (8*).

> ***Moral sensibility:*** Moral concern supported by the Basic Attributes developed for the particular situation.

(7*) and (8*) are defined without appeal to any undefined moral concept, for moral sensibility is defined in nonmoral terms, as above. These principles require one to evaluate an outcome according to the way it has affected the moral sensibilities of the individuals affected: An individual's moral sensibility is enhanced or prejudiced by enhancing or prejudicing any of his basic attributes, or his feeling for the importance of the happiness and suffering of individuals, or his concern for (7*) and (8*).

The recurrence of (7*) and (8*) expresses the fact that moral concern calls on one to follow out the consequences of one's actions, reiterating the same tests at each point, for each individual affected. The iteration of moral sensibility establishes that one must consider the impact of one's action on the moral sensibility of each of the individuals affected in the sequence of consequences, repeating the same tests. It does not allow that moral sensibility may involve some further concepts. Subject to the humanist claims, there are no concepts independent of the above that could be relevant to a fundamental theory of morality.

Moralist does not find criteria to decide which of two acceptable outcomes to seek, or which of two unacceptable outcomes; nor does she find criteria for "proportionate" in (8*). Further, actions normally lead to a number of outcomes, and Moralist does not find criteria to balance the significance of different outcomes. I do not believe there are general objective criteria for these decisions. I feel, however, that John Rawls's "veil of ignorance" provides a serviceable substitute.

> ***Moral action*** will lead to an outcome that fulfills (7*) or (8*) and avoids bad outcomes, insofar as such an outcome can be achieved in the circumstances.

It is particularly appropriate to enhance one's own moral sensibility. People can *enjoy* this. People also require their personal values and ideals.

Application. Moralist derives the fundamental principles of morality without needing ideal knowledge, so we can follow her. Indeed, we have just done so.

We cannot follow Moralist in analyzing the particularity of actual situations. Working out likely consequences for moral decisions is most difficult. But real situations demand action, and we must do the best we can, in morality as elsewhere. It is doubtful if consequences are determinate beyond a limited range. Moral argument beyond this point becomes absurd, for there is nothing there!

Few people think in terms of fundamentals. They use maxims such as "Do not lie." But fundamental principles are important, because principles justify and limit the maxims, and they may open unexpected possibilities. Whether abortion is murder or not depends on one's ontological assumptions. If a hearer accepts a lie, his or her actions are likely to turn out badly; if the hearer does not, his or her sense of reciprocity and trust are damaged. Either way, the lie prejudices his or her ability to act well. Thus lying is morally wrong, *unless* by lying one achieves a greater outcome, like hiding a Jew from the Gestapo.

The analysis shows why morality is authoritative: Moral sensibility is the supreme expression of our humanity, because it allows us to enhance the achievement of happiness in the world. This carries duty and motivation: one debases one's humanity by lying; unless by lying one achieves a greater outcome.

All conscious beings have rights, because they enjoy and suffer. Only beings with moral sensibility have responsibilities. We are responsible for lions; lions are not responsible for us.

MULTATULI (Eduard Douwes Dekker; 1820–1887), Dutch polemic novelist, author, and freethinker. Eduard Douwes Dekker was born on March 2, 1820, in Amsterdam. He died on February 19, 1887, in Germany. Dekker is one of the most important writers—if not the most important—the Netherlands has produced. He is known under the pseudonym Multatuli ("I suffered greatly").

He grew up in a middle-class family marked by the liberal tolerance of his Mennonite father, a ship captain. In secondary school he underachieved, failing his final exams. In 1838 he boarded his father's ship for the Dutch East Indies, seeking work in the colonial civil service. He secured a position in Natal (Sumatra) and began to rise through the ranks.

In 1846 he married Baroness Everdine (Tine) van Wijnbergen. Now holding a post in Mid-Java, he developed an abiding concern about the situation of the

natives. By 1851 Dekker's letters to friends in Holland suggest that he had moved from Christianity to AGNOSTICISM or ATHEISM.

By 1855 Dekker was assistant commissioner of Lebak, Western Java. He discovered that the native governor was corrupt and harshly exploiting the native population. Dekker accused the governor and his son-in-law of bribery and exploitation. Far from supporting Dekker, his superiors discharged him.

What next? Dekker could seek another civil service position, or he could write about colonial abuses in the Indies. He chose the latter. In Brussels, in a single month near the end of 1859, he wrote *Max Havelaar*, a fierce and satirical critique of the colonial system, under the pseudonym Multatuli. Multatuli sent copies of the manuscript to several acquaintances, some of whom promised him lucrative jobs if he would leave the novel unpublished; he refused because of his "passion for truth." *Max Havelaar* appeared in 1860. In its polemics and stylistic vigor it was unprecedented, creating an immediate sensation in Dutch letters, life, and politics.

Multatuli continued to write, again criticizing colonial abuses, arguing for womens' rights, and championing the working class. But his stance was neoliberal, and he never sympathized with Karl MARX or the socialist parties.

Through his brother Jan he made contact with the Dutch freethinkers society De Dageraad (Dawn). In its periodical he published "Het Gebed van den Onwetende" (Prayer of the Ignorant) in March 1861, inspiring generations of Dutch agnostics and atheists. Multatuli felt kinship with the freethinkers and their distaste for dogmatic thinking, Christian dogmatic thinking in particular. For the rest of his life Multatuli remained associated with De Dageraad.

In 1866 Multatuli went to Germany, where he wrote for Dutch journals and edited books. *Max Havelaar*, the semiautobiographical *Woutertje Pieterse*, and the play *De Vorstenschool* (Monarch's School) are his most admired writings.

Multatuli produced little during his final decade because of failing health. Upon his death in 1887 he was the first Dutchman to be cremated.

MURRAY, JON GARTH. See **O'HAIR, MADALYN MURRAY.**

NAGEL, ERNEST (1901–1985), American philosopher. Ernest Nagel was born on November 16, 1901, in Bohemia in the Austro-Hungarian Empire (now in the Czech Republic). He emigrated with his family to the United States in 1911, becoming an American citizen in 1919. He studied with Morris R. Cohen at the City College of New York, receiving a BS in 1923. Nagel then received his MA in 1925 and PhD in philosophy in 1930 from Columbia University, where his teachers included John DEWEY. Nagel was professor of philosophy at Columbia from 1931 until 1970; in 1955 his title became John Dewey Professor of Philosophy. He was president of the American Philosophical Association Eastern Division, and elected to the National Academy of Sciences. Nagel died on September 20, 1985, in New York City.

Nagel made major contributions to understanding the methodology of natural and social science, formal logic, and philosophy of logic and mathematics. He applied his views to problems such as realism versus idealism, free will versus DETERMINISM, and mechanism versus teleology. His admiration for Charles Peirce's logic of science, Dewey's atheistic NATURALISM (see also ATHEISM; HUMANISM), and the logical positivists' vision of the unity of science (see LOGICAL POSITIVISM) is central to several of his major writings. For a generation Nagel was the most prominent American philosopher of science and logic, and for several decades he was among the foremost representatives of naturalism.

With Cohen, Nagel wrote *Introduction to Logic and Scientific Method* (1934), an early and influential logic textbook notable for including symbolic deductive logic and inductive logic. Like Cohen, Nagel initially was a logical realist who held that logical axioms are a priori necessities which correspond to universal and unchanging structures of the world. By the mid-1940s Nagel had been converted by Dewey and logical positivism to the view that logical principles are instrumental rules of inference having no direct ontological implications. In essays such as "Logic without Ontology" (1944) and "Sovereign Reason" (1947) and in two books, *Sovereign Reason* (1954) and *Logic without Metaphysics* (1956), Nagel explored the pragmatist alternative of justifying logical principles by science itself. If the rules of

inference used by science cannot be independently justified by pure reason or metaphysics, they can still be justified by the empirical progress of scientific explanation. Nagel soon followed out a consequence of this scientific basis for logic, concluding that logical principles are revisable in the course of scientific progress and hence are more like a posteriori propositions.

Nagel's reunification of empiricism with naturalism, long delayed by empiricism's capture by subjective idealism, permitted him to reformulate naturalism in a striking way. By the early 1950s C. I. Lewis had already taken a pragmatic view of supposedly a priori principles, and W. V. Quine had rejected the analytic-synthetic dichotomy, but at that time both philosophers still believed that phenomenalism was a viable option. It was Nagel who forged ahead with a Deweyan confidence in scientific method in his "Naturalism Reconsidered" (1955), defining naturalism as a philosophy that declares reality as broad as the potential reach of scientific evidence and theory.

Nagel's greatest work, *The Structure of Science* (1961), attempts to describe the scientific methodology of hypothesis formulation and testing, often labeled the "deductive-nomological model," that must be common to every natural and social science. *The Structure of Science* also proposes how to accomplish the "reduction" of the entities and laws of one science to those of another by using "bridge laws." Although reductive materialists (like the later Quine) have confidently taken physics as definitive of reality, expecting that all other sciences will be reduced to physics, Nagel disavowed this restricted sort of naturalism. Naturalism should only require a common scientific methodology and not any specific results, and should accept the diverse plurality of contingent natural things without seeking any ultimate rational unity behind nature.

Nagel only sought a "contextual naturalism." This broad naturalism, which remains a widely attractive option in Anglo-American philosophy, would be strong enough to obstruct dualism and supernaturalism, yet flexible enough to permit the many interconnected empirical sciences to postulate explanatory natural processes without worrying whether they can be "reduced" to the terms of physics. The liberty of the sciences is not unlimited, however. Naturalism is violated whenever explanations appeal to powers or forces other than the properties of objects in space-time and their causally deterministic relations. For the sciences of biology and psychology, Nagel was especially concerned to forbid dangerous routes away from naturalism. In biology, he argued that teleological and functional explanations can be replaced by causal explanations; see *Teleology Revisited and Other Essays* (1979). In psychology, he argued that key mental properties (though not necessarily all) can be reduced to physical properties of the brain.

In accord with his naturalism, Nagel believed that most, if not all, religious beliefs are unwarranted and unnecessary. In "Philosophical Concepts of Atheism" (1976), Nagel held that empirical science will explain any alleged religious phenomena and never accept disembodied spirits.

JOHN R. SHOOK

NANSEN, FRIDTJOF (1861–1930), Norwegian scientist, explorer, diplomat, and author. Fridtjof Nansen was a zoologist who worked at the Bergen Museum and wrote scientific works including "The Structure and Combination of the Histological Elements of the Central Nervous System" (1827) and "A Protandric Hermaphrodite (*Myxine glutinosa*) among the Vertebrates" (1888). In 1895 Nansen explored the northernmost point at the North Pole aboard the research vessel *Fram* and wrote another book describing the adventure: Fram *across the Polar Sea* (1897).

At the end of World War I, Nansen was commissioned by the League of Nations to repatriate five hundred thousand prisoners and to assist the Red Cross in Russia. He gave a special passport—"Nansen's pass"—to thousands of refugees without nationality. In 1922 he received the Nobel Prize for Peace.

In matters of religion, Nansen was a humanist: "The religion of one age is, as a rule, the literary entertainment of the next," he once declared. Nansen maintained that whatever the citizens' religious views might be, everyone should, if possible, be given sound ethical ideas fitted to make him or her a useful and skillful member of the community—such ethical views necessarily being based on a scientific outlook.

JOSÉ MANUEL FERNÁNDEZ SANTANA

NATIONAL LIBERAL LEAGUE. An American FREETHOUGHT organization whose brief career encapsulates many of the ongoing challenges faced by such

groups, the National Liberal League was organized by a group of secularists (see SECULARISM) who met in the Concert Hall, Chestnut Street, Philadelphia, on July 1–4, 1876. The group adopted the Nine Demands of Liberalism, which were composed by the Unitarian Francis Ellingwood ABBOT in 1872. Taken collectively, the Nine Demands articulated a comprehensive separation of church and state and served for many years as a clarion call for American secularists.

The first annual congress of the league met at Rochester, New York, on October 26, 1877, and heard Henry Ward Beecher deliver what would become a famous sermon repudiating the doctrine of hell. Abbot served as the league's first president and restricted its activities to advocacy of the Nine Demands, which he interpreted relatively narrowly. Under Abbot, the league was reluctant to associate itself openly with freethought or to condemn all of the Comstock laws, a series of punitive regulations on moral issues whose noisiest champion was Anthony COMSTOCK, the longtime secretary of the New York Society for the Suppression of Vice. The league was vocal in its support of abolition and, to a lesser extent, women's rights (see WOMAN SUFFRAGE MOVEMENT AND UNBELIEF).

Its careful approach notwithstanding, the league was castigated by the religious press and caricatured as a nest of unbelievers and immoralists. The stridency of this opposition tended to encourage the very process of radicalization that Abbot was anxious to avoid. Within three years the league adopted a more radical secular stance, condemning the Comstock laws and sending D. M. BENNETT, editor of *THE TRUTH SEEKER*, as its delegate to the World Freethinkers' Congress in Brussels in August 1880. The vote against the Comstock laws was strongly opposed by Robert Green INGERSOLL, who thought the Comstock laws merited amendment rather than abolition. Ingersoll withdrew from active support of the organization after this. The league went on to gather between fifty and seventy thousand signatures calling for the repeal of the Comstock laws. Congress ignored the petition.

By 1885 it was clear that the league was not going to attract the middle ground. If much of its leadership consisted of Unitarians with patrician leanings, many of its members were German Americans with a strong tradition of freethought tinged with radical politics. The question of labor relations proved as divisive as the tensions between the materialist and the spiritualist wings of the movement (see LABOR MOVEMENT AND UNBELIEF). At the league's congress of October 9–11, 1885, in Cleveland, the National Liberal League renamed itself the AMERICAN SECULAR UNION. Ingersoll returned to become president, and the freethinking journalist Samuel Porter PUTNAM was named secretary. A rump group opposed to the name change lingered on until the turn of the twentieth century, but the initiative now lay with the American Secular Union.

In 1945 another attempt was made to form an organization called the National Liberal League under the presidency of the veteran Canadian freethinker Marshall GAUVIN. The reformed group never achieved the profile needed to attract significant funding and was weakened by factional dissension. It lasted about fifteen years.

BILL COOKE

***NATIONAL REFORMER*, THE.** The *National Reformer* was the major atheist paper during the second half of the nineteenth century in Britain. It was closely associated with Charles BRADLAUGH and the NATIONAL SECULAR SOCIETY (NSS).

A group of secularists in the north of England founded a company to establish a secularist paper in February 1860. The first issue came out in April 1860 as a demi-folio of eight pages priced at two pence. The coeditors were the young Bradlaugh and Joseph Barker, a former Methodist preacher and Chartist. Success led to weekly publication and a circulation of over five thousand after the first year. Barker left in 1861 after a disagreement with Bradlaugh over the publication of discussions of neo-Malthusianism (birth control: see BIRTH CONTROL AND UNBELIEF).

George Jacob HOLYOAKE became a chief contributor and John WATTS the subeditor. At a time of illness for Bradlaugh, John Watts took over and Charles WATTS became subeditor; John Watts subsequently died of consumption. The paper declined during this interregnum before Bradlaugh resumed the editorship in 1866, the year in which the NSS was founded with him as the first president. Bradlaugh edited the *National Reformer* until his death in 1891. It chronicled his radical FREETHOUGHT and political career, taking much of his energy and being "a sort of personal diary." John M. ROBERTSON took over from Bradlaugh and revived the paper for a while, but publication was discontinued for economic reasons in 1893.

Important contributors over the years included the economist and philosopher J. H. Levy; Edward Bibbins AVELING, a scientist with a particular interest in Darwin's ideas; and Bradlaugh protégée Annie BESANT, who became coeditor in 1881. There was much discussion as to what degree the *National Reformer* should be a freethought paper that debated religion or a general political journal. Bradlaugh wrote that it should be "an

avant-courier on political, social and sociological questions, but that it should never deal with one to the exclusion of others."

The peak of the *National Reformer*'s success was in the early 1880s, the time of Bradlaugh's struggle to enter Parliament. The critique of religion was always important and done on a more philosophical and countertheological level than the *Freethinker* with its reliance on biblical arguments. In its early years the Reform Bill to enlarge the suffrage for parliamentary elections, and republicanism to abolish the monarchy, were hotly debated. Later in the century Home Rule, to give self-rule to Ireland, and independence for India became important issues to Liberals such as Bradlaugh. Literature was not neglected; to the *National Reformer* belongs the honor of being first to publish James Thomson's "The City of Dreadful Night" (see ENGLISH LITERATURE, UNBELIEF IN). Also noteworthy is a perceptive article by G. W. FOOTE on William Blake.

A vigorous debate on socialism versus liberalism occupied the paper's columns—this issue divided Bradlaugh and Besant. The readership was largely working class until the later part of the century, when J. M. Robertson lamented the dumbing-down from the improving self-education of the Mutual Improvement Society to the light entertainment of the music halls. The heavy seriousness of the paper is a demonstration of the diligence and thoughtfulness of the self-taught freethinker of the time.

NATIONAL SECULAR SOCIETY. Founded in 1866, the National Secular Society (NSS) became the major organization campaigning for secularism in England in the second half of the nineteenth century. Its principles assert that this is the only life we have, and that we should work for its improvement. Morality, it is claimed, is social in origin, and secularists call for the complete separation of church and state. There is an overriding ambition to develop the freedom and dignity of humankind.

The coinage of *SECULARISM* came from G. J. HOLYOAKE, and the earliest secularist groups around the country developed out of "progressive" Owenite groups (see OWEN, ROBERT). Holyoake thought that *ATHEISM* came across as narrow and bigoted, and wanted to add affirmative aims. The failure of the Chartist movement left radical campaigners in disarray. By the 1860s there was a climate of greater radical action. Charles BRADLAUGH and Charles WATTS moved to create a national secular movement in 1866. Bradlaugh became the first president and Watts the first secretary of the NSS. Though it was primarily an organization for individuals, secularist groups and their members round the country also affiliated with it.

There was early success, but the impetus was not maintained. Ill health and political activities forced Bradlaugh to withdraw, leaving the society inactive in 1872. There was also some criticism of Bradlaugh's authoritarian style and his vigorous promotion of Annie BESANT as a secularist leader.

Bradlaugh's Struggle. In 1877 Bradlaugh and Besant were brought to trial for publishing *The Fruits of Philosophy*, a birth control booklet by the American doctor Charles KNOWLTON (see BIRTH CONTROL AND UNBELIEF). Besant and Bradlaugh were found guilty and sentenced to prison, but acquitted on appeal. This case caused division within the NSS, birth control being controversial even among secularists. A breakaway group led by Charles Watts became the British Secular Union. But there was inadequate support for two national secular groups, and the British Secular Union petered out.

The NSS became very concerned with Bradlaugh's struggle to enter Parliament. He was elected for Northampton in 1880 and was not allowed to take his seat because he could not be sworn in. Asked to swear on the Bible, Bradlaugh said this would have no meaning for him as an atheist. He asked to affirm rather than swear his oath of office, but was refused. It took six years of struggle until a new Parliament finally allowed him in. During this struggle secularism became a recognized social force: this period marked the peak of the society's action and influence. It was claimed that the NSS had six thousand members, including affiliated supporters. Secularist ideals were discussed in the national press and public debates.

In 1890 Bradlaugh resigned as president due to overwork and poor health. G. W. FOOTE took over, but the society had by now passed its peak. Individual membership declined from a peak of 3,792 in 1884 to 735 in 1900. Foote stated that the heroic period of freethought in England had come to an end. The development among young radicals of support for socialism (see SOCIALISM AND UNBELIEF), to which secularists were neutral or in some cases unsympathetic, lessened the remaining secularists' impact. Foote remained as NSS president, combining it with his long-standing role as editor of the *FREETHINKER* until his death in 1915. Agitation about the BLASPHEMY law, secular education, and the right to leave bequests to secular organizations were then among the NSS's principal concerns.

Chapman Cohen's Role. Chapman COHEN took over from Foote as editor of the *Freethinker* and president of the NSS, holding the former role until 1951 and the latter until 1949. He was a tireless lecturer and prolific writer,

particularly good at presenting philosophical ideas to the general public.

Two prominent presidents in the second half of the twentieth century were David Tribe and Barbara Smoker. During their terms the NSS shifted to more aggressive use of the media to gain publicity, for example, pressing complaints that the British Broadcasting Company was biased in favor of religion. The reforms of the 1960s in areas such as abortion, divorce, and homosexuality were supported, especially in the face of clerical opposition to those reforms. Under NSS executive director Keith Porteous Wood there was emphasis on parliamentary and legal issues together with an increased presence in the media. New areas of importance included the expansion of faith (denominational) schools and the increasing impact of religions other than Christianity. By the beginning of the twenty-first century, the NSS had experienced a revival of membership and activity.

JIM HERRICK

NATURALISM. Introduction. In its most familiar and general meaning, *naturalism* is the view that only natural entities and processes exist. Thus, naturalists repudiate all supernatural entities, powers, spirits, and occult forces such as ghosts, gods, devils, and demons. Let us call such a view ontological naturalism. Ontological naturalism can be contrasted with ethical naturalism, the view that ethical properties are either reducible to natural properties or dependent on them; epistemological naturalism, the view that epistemology is either a branch of psychology or is committed to no nonnatural properties; and methodological naturalism, the view that for the purposes of science, supernatural entities should not be assumed to exist. Because of space limitations, only ontological naturalism and methodological naturalism will be discussed here.

Characterizing Ontological Naturalism. *The Scientifically Explicable Account.* One standard approach to ontological naturalism is to characterize it in terms of what is in principle scientifically explicable. However, one problem with the thesis that the only entities that exist are those that are in principle explicable by science—let us call this the scientifically explicable account (SEA)—is that it is uncertain what will be explicable scientifically in the future. Phenomena that are now unexplained by science may be explained in the next several hundred years.

How serious a problem is this for SEA? Although it does not mean that SEA is useless as a test of the natural, it does mean that one must know how to use it. For if phenomenon P is not explainable at time t, it does not follow that P is not natural, since at time $t + 1$, P might be explainable. One will have to make a judgment based on the available evidence as to how likely it will be that P will become explainable in the future. Sometimes such judgments can easily be made. For example, the prospects are good that future science will explain out-of-body experiences (OBEs); indeed some investigators think that we already have the beginnings of an explanation of OBEs. So it is likely that OBEs are natural. Moreover, at present the prospects are very bad that future science will be able to explain the bodily resurrection of billions of persons in the Second Coming of Jesus Christ. Thus, one can say that if the bodily resurrections associated with the Second Coming were to occur, they would not be natural. Fortunately for naturalism, there is no reason to suppose that such bodily resurrections will occur and good inductive grounds to suppose that they will not.

A more serious problem with SEA is that many philosophers maintain that there is a realm of abstract objects consisting of numbers, sets, propositions, and so forth that cannot be explained in terms of science, although their existence must be presupposed in doing science. Does the existence of such a realm mean that ontological naturalism is not true? It might be supposed that one way to handle this problem is to show that the realm of abstract objects can be reduced to something else that is in principle explainable by science, but the prospects of such a reduction seem remote. A more plausible approach to the problem is to give a less expansive definition of ontological naturalism. It has been suggested that ontological naturalism is the view that everything with causal powers in the natural world can in principle be explained by science. Since abstract entities, unlike theological entities, have no causal powers, they pose no problem for ontological naturalism.

The Physical Dependency Account. Some naturalists have preferred to define ontological naturalism metaphysically, rather than in terms of scientific explicability. What may be called the physical dependency account (PDA) is that natural events are purely physical events, objects, or entities whose properties are completely dependent on physical events or objects. Thus, for example, even if thoughts, desires, and the like are not identical with physical objects or events, they may well be dependent on physical objects and events.

However, PDA also seems to have problems relative to the future. First, given our present understanding of the physical, it is uncertain whether certain phenomena such as near-death experiences will in the future be considered physical or not. Moreover, the present under-

standing of the physical might change, so that in a future science, some entities that are not now thought to be physical, although they are probably considered dependent on the physical, will be considered physical in some broadened account of the physical.

As in the case of SEA, one has to know how to apply PDA. If phenomenon *P* is discovered to be purely a physical phenomenon or completely determined by the physical, then it is natural. But suppose our evidence is inconclusive, and at time *t*, *P* is not established as physical or as dependent on the physical. It would not follow that *P* is nonnatural, for at time $t + 1$ the evidence might establish *P* as physical. Again a judgment based on the available evidence would have to be made about the likelihood of *P* being considered physical or dependent on the physical in the future development of science. For example, suppose parapsychology confirms that some genuine psychic phenomena exist (something it has not done so far). It seems that this would more likely be someday assimilated to PDA than would Jesus's alleged walking on water.

The abstract entity problem affects PDA as well. But again, one might say that ontological naturalism is the view that everything with causal powers in the natural world can in principle be explained in terms of physical entities or what is dependent on physical entities. Since abstract entities have no causal powers, they pose no problem.

The Spatial-Temporal Account. Other naturalists have opted for still a different account of ontological naturalism, namely, that the natural should be characterized in terms of being in space and in time. Thus, the spatial-temporal account (STA) holds that a natural event or object is one that is a spatial-temporal event or object. It might be thought that this adds nothing new to PDA, because all spatial-temporal objects are physical or dependent on the physical. But this criticism seems mistaken. An incarnated god such as Jesus Christ would presumably be a spatial-temporal object, but it would not meet the requirement of PDA at least in terms of our present understanding of the physical. The Jesus of the gospels was neither just a physical object nor completely dependent on the physical. He was more than this, for as the Son of God he was also a supernatural being. So the Incarnation would likely be a counterexample to ontological naturalism construed in terms of PDA, but it would not be a counterexample to it interpreted in terms of STA. This consequence shows however that there is something basically wrong with STA; for surely if anything is a supernatural event, it is the Incarnation. Again, fortunately for ontological naturalism, there is no reason to suppose that the Incarnation took place.

Ontological Naturalism and the Nature of Mind. Ontological naturalism is compatible with a variety of positions on the relationship between the mind and body (see COGNITIVE SCIENCE AND UNBELIEF). Ontological naturalism is certainly compatible with mind-body reductionism, according to which the mental is reducible to the physical. For example, it is compatible with analytical behaviorism, a conceptual reduction of the mental to the physical where statements about mental states are analyzed into and thus have the same meaning as statements about actual and hypothetical behavior. It is also compatible with the identity theory, in which mental states and brain states are contingently identical. On this view mental state terms do not have the same meaning as brain state terms, but they refer to the same thing.

Ontological naturalism is also compatible with eliminative MATERIALISM. On this view the mental is not reducible to the physical; rather, it is maintained that there are no such things as mental states, just as there are no such things as ghosts and Santa Claus. In a future science, talk of mental states will simply drop out and will presumably be replaced by a nonmental vocabulary. Eliminative materialism should not be confused with nonreductive naturalism, a position on the mind-body relationship that is also compatible with ontological naturalism. On this view it is maintained that mental properties supervene on physical ones; that is, all mental properties and truths are determined by physical properties and truths.

Atheism and Ontological Naturalism. Most religious thinkers today suppose that God is a supernatural being transcending the natural order, yet it is possible to hold a naturalistic view of god—in other words, to believe that there is a god and that this entity belongs to the natural order. In the twentieth century John DEWEY, for example, defined "God" as "the unity of all ideal ends arousing us to desire and action." In his eyes such a unity was explainable by scientific method and was part of the natural order. In the nineteenth century Auguste COMTE in his turn developed an organized religion completely within a naturalistic framework whose object of worship was humanity (see POSITIVISM). Comte sometimes referred to humanity as the supreme being, and this is compatible with ontological naturalism. Other philosophers, for example, Baruch SPINOZA in the seventeenth century, identified God with nature itself. Pantheistic views like his may well be compatible with ontological naturalism characterized in some of the ways specified above.

The acceptance of ontological naturalism does not exclude belief in god or gods interpreted in a nonsupernatural way. Nevertheless, such an interpretation tends to be misleading. By "God" most people mean a supernatural being, and by "atheism" most people mean a view that rejects God. If God only means what Dewey meant by this term, the famous atheists of history could well believe that God exists.

In any case, atheism does not entail ontological naturalism. Certain Eastern religions, such as Jainism, are atheistic in the sense that they do not assume the existence of an all-knowing, all-powerful, and all-good god, and yet the worldview presented in these religions is not obvi-

ously naturalistic. In Jainism the law of karma plays an important role, and it is unlikely that such a law, if it did exist, could be explainable by present or future science.

Defending Ontological Naturalism. How can the truth of ontological naturalism be defended? One powerful argument is to point to the success of science in various realms such as medicine, psychology, meteorology, geology, and astronomy. As science improves, fewer and fewer supernatural explanations are taken seriously by educated people and more and more natural explanations are accepted. Extrapolating from this data, one can inductively infer that there is reason to suppose that there are no sound supernatural explanations, and that eventually all supernatural explanations will be replaced by natural ones.

Keith Augustine has developed an interesting argument along these lines:

1. If after an intensive search of the natural world, scientists and historians have found no uncontroversial evidence for likely candidates for a supernatural event, then naturalism is probably true.
2. After an intensive search of the natural world, scientists and historians have found no uncontroversial evidence for likely candidates for a supernatural event.

---

3. Therefore, naturalism is probably true.

By "uncontroversial evidence," Augustine means evidence that is accepted by a consensus of experts doing research within the relevant empirical subject areas. Some may wonder if that requirement is too strong. Augustine maintains, however, that extraordinary claims require extraordinary evidence. This heuristic principle applies to the evaluation of claims about natural events that radically conflict with well-established scientific theories, and also to claims about supernatural events that in the light of our scientific background knowledge are initially very improbable. Augustine points out that they remain improbable even given eyewitness testimony, because empirical studies have shown time and again that such testimony is unreliable in accidents, robberies, and other ordinary events. Surely, then, there is no reason to suppose that it would be any more reliable in the case of eyewitness reports of supernatural events.

In addition to the argument from the success of science, there are atheological arguments that show that the existence of God is improbable and even impossible (see ATHEISM; EXISTENCE OF GOD, ARGUMENTS FOR AND AGAINST). But then the most common basis of supernaturalism, namely, that supernaturalism is based on belief in a theistic God, is false. To be sure, supernaturalism does not have to be based on theism, but the falsehood of theism removes a major support for supernaturalism.

In addition, there is reason to believe that the concept of the supernatural is incoherent. Thus, Gilbert Fulmer has examined the concept of a God who possesses the single attribute of being the creator of the universe, which includes being the creator of all natural laws. Fulmer argues that God's creation of the universe, including all natural laws, depends on the fact that what God wills is put into effect; in particular, it presupposes the natural law that provides that what God wills to be created is created. However, since God's creation of this natural law presupposes its prior existence, the attribute of creator of the universe is self-contradictory, and therefore a God who is creator of the universe does not and cannot exist. But since God's being creator of the universe is one of the major doctrines of the supernatural worldview, one of the major bases of supernaturalism is defeated.

Methodological Naturalism. It has sometimes been argued that science is committed to methodological rather than ontological naturalism. Methodological naturalism is a much weaker position than ontological naturalism, for it does not deny the existence of supernatural entities per se. It simply assumes for the purpose of inquiry that supernatural beings do not exist; that in the context of inquiry, only natural processes and events exist. Thus, it is compatible with theism and does not presume atheism.

The question arises: If one rejects ontological naturalism, how can methodological naturalism be justified? Methodological naturalism (MN) can be understood as the methodological rule:

> MN = In the context of science use only natural explanations!

Because it is a rule, methodological naturalism is neither true nor false. It can, however, be evaluated by pragmatic criteria. Thus one may ask what the consequences would be of following methodological naturalism in contrast to an alternative rule such as:

> MS = In the context of science assume that God is the direct or indirect explanation of everything!

There are at least five rationales for methodological naturalism: testability, the use of laws in explanations, fruitfulness, the promotion of agreement and cooperation, and the avoidance of blocked inquiry. However, the most plausible reason for adopting methodological naturalism is that supernatural explanations are "science stoppers," in that they block inquiry. This idea can be stated by the methodological rule:

> MR_1 = Do not use explanations in science that cut off further inquiry!

What is the justification for this rule? One might be inclined to argue for MR_1 on inductive grounds. However, the main argument for MR_1 is based not on induc-

tion but on vindication. Quite simply, one can never rule out the logical possibility that there is a scientific explanation of a phenomenon. Following MR_1 would not assure us that such an explanation would be discovered even in the long run, but operating with alternative rules could result in the loss of potential scientific explanations if they exist.

For example, suppose one adopted this alternative rule:

> MR_2 = Do not use explanations in science that cut off further inquiry unless inquiry-blocking explanations are the only plausible ones that can be thought of after twenty years of deliberation and research!

Following MR_2 would be unacceptable. Suppose there were an explanation that could be discovered only after more than twenty years of deliberation and research. Following MR_2 would prevent one from finding it. Other restricted methodological rules would have similar implications.

Despite the promise of MR_1 in providing a rationale for methodological naturalism, one problem remains—namely, we must make the assumption that naturalism in the context of science does not itself block inquiry. As it happens, this is not obvious. Certainly methodological naturalism does not entail MR_1. Indeed, there could be naturalistic explanations that are supposed to be brute facts, ultimate principles, and the like. Would not these block inquiry just as much as appealing to God's direct action? They would if they were allowed, but good scientific methodology should never permit anything to be more than a tentative brute fact or a provisional ultimate principle, since we can never be sure that what we think is an ultimate naturalistic explanation really is not.

Thus MR_1 can be understood as an independent constraint on MN, or MN can be revised to include this constraint. Thus we could characterize MN by the methodological rule:

> MN' = In the context of science assume that explanations can be explained naturalistically at least in the long run!

MN' is compatible with scientists acting for long periods of time as if certain explanations are ultimate, relative to their evidence and background theories. But such practice would not block inquiry, because in contrast to supernatural explanations, it would be possible for these explanations themselves to be explained as science progresses.

Conclusion. Ontological naturalism can be explicated in different ways: the scientifically explicable account (SEA), the physical dependency account (PDA), and the spatial-temporal account (STA). Although these explications raise important issues, none of them shows that ontological naturalism is untenable. Three rationales provide a strong case for ontological naturalism: the success of science, the case for atheism, and the incoherence of supernaturalism. Ontological naturalism is compatible with several positions on the mind-body problem, including analytical behaviorism, the identity theory, eliminative materialism, and nonreductive materialism. Although ontological naturalism is compatible with some pantheistic and humanistic views of God, it is incompatible with traditional theistic notions. There are several rationales for methodological naturalism, but the most plausible is that properly construed, it does not block inquiry.

NATURALISTIC FALLACY. G. E. Moore and David Hume. According to English philosopher G. E. MOORE, the naturalistic fallacy is the mistake of identifying *good* with any such naturalistic characteristic as well-being, freedom, survival, pleasure, or self-realization. In attacking subjectivism in ethics, Moore contended that neither divine commands nor any of the other reputed candidates qualify as *good*. To open the door for one contender at the exclusion of any or all of the others would be an arbitrary selection. Furthermore, it could not be an open question as to which natural properties suffice, since good is its own unique property. The sphere of ethics, Moore argued, must then define itself by reference to this simple, unanalyzable, indefinable property.

David HUME had earlier denied that moral duties could be derived from a description of natural facts. No moral *ought* can be deduced from what *is*, no ethical conclusion from factual premises. Moore's so-called Common Sense philosophy regards facts as objective by their existing independently of any private conscious-

ness. Good, too, he argued, has objective status and must be directly intuited, which means its reality does not derive from individual private, subjective attitudes. Good is unique and is not a composite of other qualities. As an intuitionist, Moore regarded as self-evident that it is morally wrong to knowingly commit an act that would make the world on the whole truly worse.

Intrinsic Value. In seeking to rise above moral subjectivism, Moore concluded that good is intrinsic and not instrumental to something else. Intrinsic value or intrinsic worth refers to the unique object or property *good*. Consequently, in asserting that an action is *the* best thing to do, we assert, said Moore, that it together with its consequences presents a sum of intrinsic value greater than any possible alternative.

Ordinary Language. While Moore helped to birth ordinary language analysis, especially in England, his analysis of ethics seems ironically to pay insufficient attention to the richness and subtlety of everyday language. He failed to grasp that the objective good as a distinct, unanalyzable property is a fiction. He did not see clearly that human morality must involve both the subjective and the objective. Without individual desires, wants and needs, morality and ethics would be both impossible and pointless. Moore asked us to imagine two worlds: one is filled with beauty; the other is a heap of filth. Which world is the better? The question makes no sense unless it presupposes the existence of an experiencing subject to experience it. Without at least the possibility of an experiencer, the choice between the alternative worlds would make no difference. For whom would it make a difference? At the same time, the physical conditions and social environment are the objective pole of morality. When we speak of a good community, good climate, good food, good colleagues, and even a good question to advance an argument, we involve both subjective and objective factors. A killer distinguishes a good rifle from a bad one. A good killer might prove to be a bad citizen. The careful study of ordinary language can throw far more light on ethics than Moore apparently realized.

Darwin and Natural History. Charles DARWIN devoted considerable thought to human morality, including love and the sense of oughtness. In chapter 4 of *The Descent of Man* he wrote that the moral sense or conscience is the major difference between our species and other species. In particular, this refers to the philosopher Immanuel KANT, who drew a sharp line between our sense of oughtness on the one side, and our desires and appetites on the other side. Darwin set out to understand moral consciousness by probing what he called natural history, raising the question of whether the study of other animals could cast light on the human conscience. Moore raised doubts about any attempt to become informed of the content of goodness by studying other species. He granted that Darwin had written profoundly of social instincts and sociability among various species. From such descriptions, no matter how accurate, however, no moral duties for humans can be derived, Moore argued. Many species engage also in aggressive conflict, demonstrating considerable hostility toward outsiders. From that fact, can we derive the conclusion that human beings, too, *ought* to engage in hostilities toward outsiders?

Herbert Spencer's Naturalistic Hedonism. Moore discussed at length the evolutionary theory of Darwin's friend Herbert SPENCER, who recognized two critical facts about a great variety of species: (1) the members of a species tend to form small groups that provide mutual support and reinforcement, and (2) the groups tend to develop hostility toward members of other groups of the same species. Given the two facts, which of them provides our species with information about the content of the good? Assuming that Spencer's *description* of other animals' behavior is reasonably accurate, we still face the *ought* question. Ought we as human beings take what Spencer regarded as the amity-enmity complex and cultivate it as a moral principle for ourselves?

Moore charged that in assuming the ethic of naturalistic hedonism (maximizing pleasure) to be self-evident, Spencer commited the naturalistic fallacy. While acknowledging that his fellow Englishman's descriptions may make a valuable contribution to the field of ethics, Moore insisted that what is needed is a clear discussion of the "fundamental principles of Ethics." He replaced naturalistic hedonism with "good" and then insisted that it denotes a unique, indefinable quality that is self-evident.

Some philosophers in the tradition of ARISTOTLE regard self-realization as the self-evident base of ethics. Other thinkers advance different candidates. John Hospers in *Human Conduct* defends a version of utilitarian hedonism, which is greatly different from the Cyrenaic school, which emphasizes maximum pleasure in the present without regard for tomorrow. A hedonist might ask Moore, Aristotle, Kant, and others the following two questions: Would you want or approve of a world filled with goodness, self-realization, goodwill, divine commands, or rational freedom if that world were devoid of all pleasure and all hope of pleasure? Could such a world exist?

Fruitful Inquiry. Karl POPPER suggested that the quest for the manifest truth or self-evident truth of this or that claim has much in common with the quest for the infallible source of truth. While no self-evident principle or source in ethics has materialized, the quest and its accompanying criticism have nevertheless stimulated new directions of inquiry and generated fruitful ideas that have thrown light on the course of human commitments and values. A study of the natural history of our own species suggests that at any moment in time, our institutions and traditions have generated both horror and values. Popper noted that they imposed limitations on our creative freedom and on our powers of rational

criticism. The same institutions and traditions have provided us numerous values we might not choose to abandon—including that of criticizing and modifying our institutions and traditions, not by the dictates of an infallible source or criterion, but by the accumulation of wisdom and insights that comes through free exchanges in an open society.

NEPAL, UNBELIEF IN. Nepal is centrally located on the southern slope of the Great Himalayan Range in south central Asia, commonly known as the Hindu Kush. Bound by China to the north and India to the east, west, and south, it is the location of Mount Everest and Kathmandu. Before characterizing unbelief in Nepal, which comprises both explicit humanist activism (see HUMANISM) and a broader social resistance against traditional social structures often mediated by religion, we must explore the existing social and religious context of this complex society.

The social fabric of Nepali society is based on the caste system and a fatalism for which Hindu religion provides the ideological superstructure. Until very recently, orthodox Hinduism was the traditional basis of state polity and of interethnic relations, and the various caste and ethnic groups exist in a hierarchical structure with the Hindu high-caste groups at its apex. The two highest Hindu caste groups of *Brahmin* and *Chhetri* have traditionally exercised economic and political dominance in the society, and this advantage is also shared by one Tibeto-Burman ethnic group, the *Newar*, who mostly come from the agriculturally fertile valley of Kathmandu and have traditionally benefited from its commercial and political significance.

Peoples. The cultural landscape of Nepal is characterized by a north-south horizontal divide consisting of the Tibetan cultural tradition in the north, a spillover of the Indo-Gangetic (Indian) civilization in the southern plains, and an admixture of the two in the middle hills. Similarly, the society is also characterized by a vertical divide between Hindu caste groups on one hand and various Tibeto-Burman ethnic groups on the other, the latter traditionally identified with specific geographic subregions of the country. There are sixty recognized ethnic/caste groups in Nepal, though the method of characterizing them is inconsistent. Most of the settlements in the country are ethnically mixed; they are generally shared by various Hindu high-caste groups, Tibeto-Burman ethnic groups, and the traditionally untouchable Hindu low-caste occupational groups, now generically known as *Dalits*, who mostly earn their livelihood by rendering specialized services and unskilled labor to other households in an age-old patron-client relationship.

Religion and Society. Religion occupies an integral position in Nepali life and society. Until very recently, Nepal was the only constitutionally declared Hindu state in the world; there is, however, a great deal of intermingling of Hindu and Buddhist beliefs. The constitution of 1990 provided for freedom of religion and permitted the practice of all religions with some restrictions, though the government generally has not interfered with the practice of other religions. The constitution described the country as a "Hindu Kingdom," which meant that the state did not treat all religions on an equal footing, but this scenario has changed with the proclamation of Nepal as a secular state by its House of Representatives following the historic democratic movement of 2006. The Nepali government formed after the democratic movement of 2006 is in the process of holding an election for Constituent Assembly which will draft a new constitution presumably institutionalizing all proclamations of the House of Representatives, including that concerning secular statehood. Nepal has begun its journey toward secular democracy, but it has not yet reached its destination.

Those who convert to other religions from Hinduism may face isolated incidents of violence or some social ostracism, but generally do not fear admitting their affiliations in public. The US government discusses religious freedom issues with the government of Nepal in the context of its overall dialogue and policy of promoting human rights. The US Embassy maintains regular contact with Hindu, Christian, Buddhist, Jewish, Baha'i, and other religious groups.

For decades, dozens of Christian missionary hospitals, welfare organizations, and schools have operated in the country. These organizations have been criticized for proselytizing the poor hill ethnic groups. Yet missionary schools are among the most respected institutions of secondary education in the country; many of the country's governing and business elite, including the top rebel Maoist leader, graduated from Jesuit high schools.

Societal Attitudes. The adherents of the country's many religions generally coexist peacefully and respect all places of worship. Most Hindus respect Buddhist shrines located throughout the country; Buddhists accord Hindu shrines the same respect. Buddha's birthplace in Nepal is an important pilgrimage site for Hindus, and Buddha's birthday is a national holiday.

Some Christian groups report that Hindu extremism has increased in recent years. Of particular concern are the Nepali affiliates of the India-based Hindu political party Shiv Sena, locally known as Pashupati Sena, Shiv Sena Nepal, and Nepal Shivsena. During late 2001, Muslim leaders complained that Hindu fundamentalists increased their campaigns of anti-Islamic pamphleteering and graffiti. Government policy apparently does not support Hindu extremism, although some political figures have made public statements critical of Christian missionary activities.

Although discrimination is prohibited by the constitution, the caste system strongly influences society. Societal discrimination and government inaction against members of higher castes remains widespread and persistent. Hindu religious tradition long prohibited members of the lower caste from entering certain temples. Due to the persistent pressure of HUMAN, Nepal's national humanist group (see below), and the Center for Inquiry/Nepal, the government was forced to announce that caste-based discrimination is illegal. This has to some extent facilitated temple access for members of the lower castes.

Social Reform and Religious Opposition. Hindu religion has not only provided the metaphysical base for perpetuating the social oppression of the *Dalit* castes but also has seriously hindered the social reform movement attempted in the past to socially integrate these castes. Even after the advent of democracy in 1990, the conditions and the fate of untouchable castes have not changed. Realizing the need for a strong organizational base to effectively carry out the progressive interventions in every aspect of social life, *Dalits* and other low-caste groups have formed many organizations with a view to create greater space for their participation in political and social process. They have initiated and provided some leadership toward a progressive social reform movement. Organized humanism has significantly contributed to the rise of this reform movement, particularly by campaigning against oppression of untouchables.

Ethnic activism can be seen as another important and potentially powerful movement for social change. Ethnic activism arose in Nepal in the aftermath of the 1990 people's movement, prior to which it was widely assumed that the subjugated people had previously accepted the inevitability of their fate, perhaps generations ago. As a platform for the common cause, a federation of ethnic groups was formed (Janajati Mahasangh). It includes twenty-two mostly non-Hindu ethnic groups, many of which were represented at the National Convention of Nepali Indigenous People in April 1993.

The 1990 constitution declared Nepal as a multiethnic and multilingual state despite retaining the holdover title of "Hindu Kingdom." The freedom whereby subjects have become citizens has unleashed new political pressures.

Organized Humanism. Because Hindu beliefs and tradition so strongly anchor Nepalis in ancient and abusive structures such as the caste system, it is reasonable that only a strong humanist and social reform movement could rupture the traditional bondage of Hindu casteism and push Nepali society toward progressive transformation. The Humanist Association of Nepal (HUMAN) was established in 1997 with the objective of disseminating humanist values, principles, and ideals through secular humanist education campaign activities. Its founding president was Gopi Upreti, a professor at Tribhuvan University, Nepal, a teacher of ecological agriculture and horticulture at Institute of Agriculture and Animal Sciences (IAAS), and principal founder of the Nepal Institute of Health Sciences (NIHS) at Purbanchal University, Nepal.

The Center for Inquiry/Nepal (CFI/Nepal) was formed as an affiliate organization of the Center for Inquiry/Transnational in 2004. Since its formation CFI/Nepal has been very active in its campaign for secular democracy, the use of science and reason to guide human behavior, tolerance and social harmony, and the elimination of religion and caste-based discrimination in Nepal. HUMAN and CFI/Nepal share fundamentally the same humanist philosophy, values, and principles, and operate collaboratively.

HUMAN and CFI/Nepal each came into existence with the objectives of upholding and promoting scientific rationality, human dignity, and freedom through humanist education and secular democracy. They have become the frontline organizations in fighting against superstitions, paranormal practices, fatalism, the caste system and untouchability, the dowry system for marriage, and religious and political fundamentalisms. Calling for unqualified respect for the fundamental human rights of all citizens, they have spearheaded a campaign for the secularization and democratization of Nepali society. This is evident from the significant roles they have played in the democratic movement of 2006, particularly in nurturing the concept of secular democracy and statehood. This is, indeed, a matter of great pride.

HUMAN and CFI/Nepal have contributed significantly to the drafting of legislation to protect untouchables and other innocents from varied social malpractices induced by religious and superstitious worldviews. In conjunction with human rights activists, *Dalit* organizations, women's organizations, political parties, and the young, HUMAN and CFI/Nepal have initiated a movement of secular democratization of Nepali society that deserves the continuing support of the world humanist movement.

HUMAN and CFI/Nepal are increasingly concerned about an emerging phenomenon of religious proselytizing by well-organized and funded religious missionary organizations following the historic proclamation of secular statehood. A number of Muslim and Christian missionary organizations, long present in Nepal, have now become very active. The proclamation that Nepal is a secular state has also given an excellent pretext for Hindu fundamentalists and erstwhile royalists to organize and protest against the realization of secular democracy. The task of HUMAN and CFI/Nepal will become even more challenging in the days to come, both in helping to continue the secularization and democratization of Nepali society, and in creating an environment that can promote social harmony and tolerance among different religious and ethnic communities.

GOPI UPRETI

NETHERLANDS, THE, HUMANISM IN. "The capacity to give meaning to and shape one's own existence characterizes the Netherlands from the past to the present, and from bottom to top. Reclaiming land from the sea, building up an international trading network, establishing freedom and tolerance in a world of violence and religious fanaticism: in other words, making a paradise from a swamp." This is how Rob Tielman, a sociologist and former chairman of both the Dutch Humanist Association and the INTERNATIONAL HUMANIST AND ETHICAL UNION (IHEU), described the Netherlands back in 1994. This image of paradise has taken a few knocks between then and 2005. The nation's more than sixteen million inhabitants live in a society that is characterized by "abundance and unease" or "[t]he embarrassment of riches." In a financial, economic, and social sense, there is considerable abundance, albeit distributed less than perfectly among the population. In a cultural, political, and moral sense, the unease can be observed in problems of integrating immigrants into society, fundamentalism from Left to Right and from believer to unbeliever, a loss of confidence in politics, declining tolerance, as well as in a quest for new or different ways of giving meaning to life.

In the Netherlands, no fixed frameworks for the meaning of life have existed for some decades. Whereas in 1966 some 64 percent of the population were churchgoers, in 2005 only 37 percent of the Dutch population belonged to a church, and of these, 60 percent were marginal members, attending church only a couple of times a year and believing in the church's positions on matters such as the existence of heaven and hell only to a very limited extent. Of the population born after 1960, no more than 27 percent belonged to a church. Conversely, 39 percent of the population had a system of values that was largely consistent with the core values of HUMANISM—self-determination, equality, responsibility, tolerance, and the like—and also feel affinity with organized humanism. More specifically, approximately one million people eighteen years of age and over living in the Netherlands can be said to show tangible evidence of active affinity with the humanist movement. This makes humanism the third-largest LIFE STANCE movement in the Netherlands, after Protestantism and Catholicism. However, the official number of organized humanists (registered members of one of the two large humanist organizations) is far lower, and is even declining: approximately twenty-eight thousand members. Nevertheless, organized humanism offers a broad and comprehensive package of services, which, although largely paid for by the government, is completely independent of the government in terms of content. Understanding this paradoxical situation requires some knowledge of the history of the Netherlands.

Religion and Secularization. The Dutch have a long tradition of religious tolerance and pluralism, and especially of religious freedom, from the Napoleonic period in the early nineteenth century. The preceding two centuries were dominated by the Dutch Reformed Church, although other religious traditions were tolerated. More to the point, the Dutch have a strong humanist tradition drawn from Desiderius ERASMUS, Dirck Volckertszoon Coornhert, and Baruch SPINOZA; the first Dutch constitution of 1798 incorporated several essential principles for building a secular democratic constitutional state. The most important of these were: "Every citizen has the freedom to serve his god in accordance with the conviction of his heart," and a radical separation of church and state. The Calvinists, who separated from the Reformed Church in the nineteenth century, and the Catholics felt that they were being treated as second-class citizens in

the second half of the nineteenth century, and started to organize themselves separately. They can be viewed as social movements based on religion. Their aim for emancipation was based on the principle of equal rights. These emancipation processes resulted in a typically Dutch solution: "the ideological separation of society," which is also referred to as the "pillarized society." Society was divided into different religious "pillars," a metaphor for pillars standing side by side, without contact except by way of the roof that they are supporting. Each pillar had its own institutions including political parties, trade unions, newspapers, hospitals, broadcasting stations, and social work institutions. The social life of citizens was often restricted to their own community. At the end of the nineteenth century there were two large communities, or pillars, based on worldview: the Catholics and the Protestants. A third pillar consisted of nonreligious groups, such as liberals, socialists, and freethinkers (see FREETHOUGHT), or humanists; this was called the neutral pillar. This social constellation was possible because of two simultaneously acting principles: on the one hand, pacification and nonintervention in one another's spheres of influence; and on the other hand, the principle of equal entitlements, which meant that the different communities would receive identical rights and services. One reason this could work is that the pillars were numerically roughly equal. Until approximately 1960, the pillarized system worked well, but then disintegrated rapidly as a consequence of the all-embracing modernization process in society, which was characterized by rationalization, individualization, and SECULARIZATION. The traditional communities fell apart and lost influence. The pillars and the related institutions were dismantled at a rapid pace by this process, with the exception of parts of the healthcare, education, and broadcasting sectors.

An essential point for the current position of organized humanism is that between 1945 and about 1989, it had been able to benefit from the equal entitlement principle mentioned above by setting up a variety of organizations for practical activities, from social work and education to broadcasting, which were largely paid for by the government. This happened despite the fact that humanists were and are opposed in principle to dividing society into pillarized blocs.

Organized Humanism. The founding in 1856 of the freethinkers association De Dageraad, currently De Vrije Gedachte (see NETHERLANDS, THE, UNBELIEF IN), marked the beginning of the modern organized humanist movement in the Netherlands. Shortly after the end of World War II in May 1945, two humanist organizations were founded independently of each other: in May 1945 Humanitas, and in February 1946 the Humanistisch Verbond (HV).

Humanitas is an organization for social services on a humanist basis. Its founders, predominantly social democrats, wanted to provide churchless people with an alternative for the social assistance traditionally provided by the churches. They mainly offered practical help to people in need. For them, *humanism* was translated as seeing the person as an individual, but at the same time as a part of society. The focus was on both personal responsibility and care for other people, which was substantially different from church-based charity. Humanitas expanded considerably in a short time and organized itself into local departments. A characteristic feature of Humanitas was, and still is, that a substantial part of its work is carried out by self-trained volunteers. Over the years, this work evolved from providing individual social services more toward community development. The number of members declined between 1980 and 1994, while many subsidies have stopped, and Humanitas is in search of new ways forward. These ways are being found in the promotion of community development, especially that based on "empowerment": supporting people in marginal positions to acquire a substantive place in society through their own efforts and with their own, possibly limited, resources. In 2005 the work was carried out by approximately ten thousand volunteers in five districts and eighty local departments. Humanitas has approximately fifteen thousand paying members, and the volunteers are supported by approximately two hundred paid executive staff. In addition, Humanitas itself is spawning several large independent humanist organizations in the fields of child daycare and care for the elderly, with more than three thousand workers and eight hundred volunteers. The Humanitas motto is "Do what you have to do," which is a good example of an extremely practical form of humanism.

The Humanistisch Verbond (HV, Dutch Humanist Association), founded on February 17, 1946, gave both substantial and organizational direction to organized humanism in the Netherlands between 1946 and 2000. The two most important motives for founding the *Verbond* were described by Jaap van PRAGG, the undisputed "father of modern Dutch humanism," as "the major and the minor struggle." The "major struggle" was concerned with supporting and providing a life stance "roof" for the large group of people that the church had abandoned and who had a mainly implicit humanist worldview, if any: they were at risk of sliding into futility and nihilism (moral indifference), partly in response to memories of the horrors of World War II. The minor struggle was for the emancipation of churchless people seeking a full-fledged position in society. The minor struggle in particular was conducted with verve, and made grateful use of the same weapons that its opponents, especially the Catholics and Protestants, had developed in their own emancipation struggles. These weapons included pacification and nonintervention in one another's spheres of influence and the principle of equal rights for separate ideological groups. Despite the Verbond's small membership, because of considerable hard work, effective lobbying on the part of a strategically formed board, and by

keeping in step with Dutch civil society without causing offense, the Verbond's struggle had delivered many successes by around 1970. Conspicuous were equal state-funded entitlements in humanist counseling, broadcasting, development aid, and education. A milestone was reached in 1965 with a government declaration that explicitly recognized both the Judeo-Christian tradition and humanism as the basis of society.

The secularization of society also had a direct influence on the course of the Verbond. From 1966, the HV had considerable difficulty in finding a new mission and a new humanist program that could command enthusiasm in what was becoming an increasingly humanist society. Under the chairmanship of Rob Tielman, the HV had a clear identity as an organization that favored a worldview based on the principle of self-determination of individuals, worked for legalizing abortion and euthanasia, opposed discrimination against homosexuals, and promoted the emancipation of women. After this period came a long episode in which the HV searched for form and content. This coincided with the loss of subsidies and a considerable fall in the number of members. In 2005 the HV was concentrating on the association itself (forty-three departments); providing services, such as speeches at funerals, humanist counseling, and relationship celebrations; and propagating a humanism centered on individual freedom of choice and responsibility. The motto of the Humanistisch Verbond is "Think independently, live in fellowship."

It is possible to defend the assertion that what van Praag called the "major struggle"—against nihilism and for the moral resilience of the public—never really took off, but is actually where a great need exists in the current time of abundance and unease. The HV is now trying to satisfy this need in the Humanistische Alliantie (Humanist Alliance), which was founded in 2001 and is reviewed below.

For the HV, humanist counseling (a sort of secular chaplaincy) was an important practical form of humanism. It became established after 1950 in the army, prisons, and the healthcare sector. In the 1970s army, prison, and hospital counseling were spun off into separate organizations still under the supervision of the HV. Since 1989 counselors have been trained at the University for Humanistics in Utrecht, which is fully state-financed as an accredited university, like the Roman Catholic and Protestant theological universities (see NETHERLANDS, THE, HUMANIST EDUCATION IN). As of 2005 some 250 humanist counselors work on a professional basis.

Other Organizations. Hivos (Humanist Institute for Development Aid), founded by the HV and De Vrije Gedachte in 1968, is a humanist development organization that stands for emancipation, democratization, and poverty reduction in developing countries. The reason for founding Hivos was the complete absence of a state-supported development organization that worked from a non-Christian ideology and explicitly used non-Christian channels to deliver aid. As an official nongovernmental organization, Hivos spends more than 70 million yearly in support of local organizations and initiatives in developing countries: currently in more than thirty countries in Africa, Asia, and Latin America. Among the priority areas are human rights and AIDS, the environment and development, gender, and women. The IHEU is an important link for Hivos in supporting humanist-oriented organizations in developing countries.

From around 1946, the sound of humanism has been heard on national radio and later on national television. In 2005 the Humanistische Omroep (Humanist Radio and TV) operates an independent foundation under the Verbond, with approximately twenty paid staff providing 208 hours of radio and 39 hours of television a year. Characteristically programming focuses on topics such as world citizenship, culture, autonomy, and social engagement. In addition, the humanist movement has two explicitly humanist periodicals that are independent of the direct influence of any organization. The *Humanist* is a bimonthly magazine aimed at a general public, with articles on the broad areas of giving of meaning to life and worldview. The *Journal for Humanistics* can be considered an academic journal. Published four times a year, it focuses on the interface between social developments, cultural issues, and existential themes.

A fairly recent branch of the humanist organizations' family tree is the Humanist Archives, founded in 1996 as a center for the archiving and documentation of history with respect to humanism in the Netherlands from 1850 to the present. In addition to managing archives such as the IHEU archive, the Humanist Archives collect publications and maintain a heavily used Web site.

All the explicitly humanist organizations, mentioned above or otherwise, form a complex weave of theoretical and practical orientations that cover a large number of social fields including healthcare, education, mass media, human rights, development aid, social work, and dealing with the existential concerns of individuals. The roots of this family tree are formed by De Vrije Gedachte, Humanitas, and the Humanistisch Verbond.

Renewal of Organized Humanism. A renewal effort for organized humanism was urgently called for. Because the core values of humanism had been widely accepted and a high level of individual emancipation had been achieved in Dutch society, organized humanism needed to redefine its mission. In addition, there had been a sharp decline in the number of organized humanists and an almost total disappearance of state subsidies. This renewal effort is currently proceeding along two lines.

The Humanistische Alliantie (Humanist Alliance, a federation of humanist organizations), founded in 2001, aims to act as a "network organization" to strengthen humanism and the humanist movement, among other things by jointly developing humanist-inspired visions and practices, promoting common interests in the world of politics and society, conducting joint communication

activities, and coordinating fundraising activities. Above all, they aim to give humanism in the Netherlands a voice in societal debates. All large humanist organizations and others belong to the Alliantie, comprising (as of 2004) seventeen member organizations and about twenty-five partner organizations, encompassing some 12,870 volunteers, 57,550 members/donors, and 6,410 paid staff.

The second line of innovation is related to the content of humanism as a worldview. "The" humanism is no longer a clearly defined entity in the Netherlands, having splintered in recent decades into substantially different "humanisms." Besides the traditional humanism as a life stance and worldview, oriented toward giving meaning to life, there is "political" humanism, which sets out to achieve the humanization of society from moral and political motives and is rapidly gaining ground. Nor have atheistic humanism or RELIGIOUS HUMANISM disappeared. At the same time, humanism has spread far and wide in society. Although the number belonging to humanist organizations has declined, humanism as a social principle is clearly on the rise.

Though a relatively small percentage of the population counts itself part of the humanist movement, a far larger percentage feels affinity with humanist ideals, while the values shared by an even larger fraction of the population reflect such humanist core values as self-determination, equality, responsibility, tolerance, and the like.

BERT GASENBEEK

NETHERLANDS, THE, HUMANIST EDUCATION IN. The Netherlands is one of the most secular societies in the Western world. Half of the Dutch are atheists or agnostics (see NETHERLANDS, THE, UNBELIEF IN). Humanism is accepted constitutionally as an alternative LIFE STANCE with equal status to any of the theistic religions, including the right to found state-funded humanist schools. The humanist movement in the Netherlands is one of the strongest in the world: 40 percent of all Dutch adults identify themselves as humanists, and 17 percent of all Dutch pupils attend humanist education (see below) in pluralist (public) schools (see NETHERLANDS, THE, HUMANISM IN).

The Dutch humanist movement has always been in favor of pluralist schools attended by pupils of different life stances. No religion is imposed upon others, and information about various life stances is taught as objectively as possible. Pluralist education is not value neutral, because it recognizes that values play an important role in daily life. Students are encouraged to give meaning and shape to their lives in a nondogmatic and tolerant way.

Though the Dutch humanist movement was legally able to found humanist schools, it chose not to do so out of concern that life stance–based schools might become dogmatic and indoctrinate children in their parents' philosophy of life. From a humanist perspective, children are not the possession of their parents but only of themselves. This implies that parents and educators have to guide children in such a way that they are increasingly empowered to create their own lifestyles. This human right to self-determination is so fundamental that children should understand it at an early age. Humanists support this process by offering optional humanist education classes as an alternative to the similarly optional religious education classes already offered in a pluralist school system.

The Dutch school system implements the separation of church and state, but does offer parents and children the choice of optional humanist or religion education during set hours in pluralist schools. Humanist educators conduct humanist education classes under the jurisdiction of Dutch humanist organizations. Optional religious education is taught under the jurisdiction of the various churches, mosques, and synagogues. All life stance education is supervised by school inspectors. Mandatory education in factual knowledge on all important life stances is the responsibility of the pluralist schools in the Netherlands. By this division of jurisdictions, the Dutch state can guarantee the separation of church and state and at the same time offer an opportunity to give life stance–based education within constitutional limits to those who want it.

In the past, many humanists assumed that education in itself guaranteed the development of an ethically responsible world. Their assumption was that spreading knowledge was equivalent to spreading ethical awareness. In

reality, what happened instead is that theocracy tended to be replaced by technocracy. Democracy is more than spreading information freely. It demands the concrete training of individuals' capacity to give meaning and shape to life. In the battle between theocracy and technocracy, humanists defend democracy. Ethical education is therefore essential.

Science is a necessary but insufficient condition for humanist education. Most Dutch humanist educators do not believe in the dogma of scientific and economic "progress" as a natural law, though this does not mean that they oppose progress as such. While many Dutch humanist educators would describe themselves as postmodern in their viewpoints, postmodernism is not monolithic. We must distinguish between at least two types: antimodernism and neomodernism. Antimodernism assumes that all science is bad; its clarion call of "back to nature" means the elimination of human values as basic principles. In contrast, neomodernism incorporates nature without making it sacred, recognizing that we are free and responsible to give meaning to our existence. Neomodernism embraces the best of the Renaissance and Enlightenment (see ENLIGHTENMENT, UNBELIEF DURING THE) with their humanistic traditions of self-determination.

In Dutch humanist education, the ideals of the French and American revolutions play an important role. Freedom is not considered to be the absence of rules but rather the presence of self-determination. Equality does not mean uniformity but rather equal access to human rights by all people. Solidarity is not imposed but rather seen as the consequence of implementing self-determination: the concept of enlightened self-interest. Freedom is frequently misinterpreted as the right to discriminate against others, whereas equality implies the right not to be discriminated against. This dilemma can only be solved by a principle higher than freedom or equality. That higher principle is self-determination.

Self-determination means the right to give meaning and shape to one's own life as long as others are not prohibited from exercising their own rights to self-determination. More practical than the concepts of freedom and equality, the principle of self-determination is able to settle tensions among individuals and between minorities. It is very understandable why the Dutch people chose to incorporate this principle as the leading concept guiding their constitution. The Netherlands has a long tradition of dealing with religious, ethnic, and other minorities, and most Dutch are aware of the fact that they themselves belong to various minorities. When all citizens recognize their minority status and their need for minority rights, they will become more sensitive in defending minority rights for everyone else so long as others are not harmed. This awareness can help to guarantee a true pluralist democracy.

This tolerant perspective has faced a new challenge with the rise of Islamic fundamentalism in the Netherlands. Should democracies be so tolerant as to allow intolerant activities? Democracy is not the dictatorship of the majority, but the implementation of the right to self-determination. Fundamentalist parties that seek to take over power in order to end democracy should therefore not be tolerated in democratic elections. But it is a mistake to think that all Muslims are fundamentalists. Most Dutch Muslims are not; indeed, the Netherlands has a long liberal Islamic past in its former colony, Indonesia (see INDONESIA AND SOME OTHER ISLAMIC COUNTRIES, UNBELIEF IN). By excluding Islamic religious education from neutral public schools, as in France, one creates a vacuum that fundamentalists can easily exploit. By allowing optional Islamic religious education under the same human rights–based democratic conditions in pluralist schools, we support the integration of minorities in society.

We could speak of an integration paradox. By excluding religious education from neutral public schools we create a vacuum that supports segregating fundamentalist tendencies. By including religious education in public schools without making it optional, we violate the rights of nonbelievers such as humanists. By integrating both religious and humanist education in an optional way in pluralist schools we prevent both theocratic and technocratic tendencies and strengthen democracy. In fact, many pupils of Islamic background make a free choice for humanist education in Dutch pluralist schools. Comparing the Netherlands with Northern Ireland, Iraq, and the former Yugoslavia, one can understand the importance of life stance–pluralist education for human rights–based democracy.

The Dutch humanist movement implements these principles in daily life in a practical and pragmatic way. Practical humanism assumes that people act according to their own life stance based upon self-determination. The task of the humanist movement is not to attack religions but to create a positive alternative to theism. Humanists try to guide people in such a way that they will be as free and as responsible as possible. In the Netherlands about 400 humanists are educating young people in humanist life stance and life styles. Over 250 humanist professionals are counseling people in hospitals, prisons, and the army in finding solutions to their existential problems. Some twenty journalists present humanist ideas to the general public through humanist media, including the Humanist Broadcasting Company. More than ten professors are now employed full time in humanist studies, taking responsibility for the training of humanist professionals in various universities all over the country. In addition, the state-funded University for Humanistics in Utrecht has eight professors and more than three hundred students who are trained as humanist professionals in counseling, education, research, and related fields. And the *Journal for Humanistics* gives the necessary professional information and guidance.

ROB TIELMAN

NETHERLANDS, THE, UNBELIEF IN. In the Netherlands, native country of the internationally famous humanist Desiderius ERASMUS, the first real freethinker probably was Herman van Rijswijk, who in 1512 was burned at the stake because of his liberal ideas. Other forerunners of the FREETHOUGHT movement were the humanist Dirck Volckertszoon Coornhert, an advocate of religious tolerance; and the philosopher Baruch SPINOZA.

Nineteenth-century Dutch freethought history begins with a book—and ever since, Dutch freethinkers have been prodigious writers and readers. In 1854 Franz Junghuhn published *Licht- en schaduwbeelden uit de binnenlanden van Java* (Images of Light and Shadow from Inner Java). In this moving and influential study, the author expressed his indignation at the way missionaries in the Dutch Indies propagated their ideas. Junghuhn rated the native religions, based on nature and reason, at least on a par with Christianity and saw the Christian faith as destructive.

In October 1855 Junghuhn and publisher Frans Christiaan Günst launched the freethinker periodical *De Dageraad* (Dawn). One year later, on October 4, 1856, a society of the same name was founded by Günst and some fellow members of the unorthodox Amsterdam masonic lodge *Post Nubila Lux* (After Darkness the Light). The ubiquitous light-and-dark metaphor refers to the contrast between the obscurity of the Christian revelation and the enlightenment associated with human reason, science, and the autonomy of mankind.

The "heroes" of De Dageraad were Spinoza, the polemical author MULTATULI, Jacob Moleschott, and Johannes van Vloten, as well as the German materialists Ludwig FEUERBACH and Ludwig BÜCHNER.

The theoretical base of the freethought movement in the Netherlands was twofold. The majority adhered to the materialist monism of philosophers like Feuerbach, Büchner, and Moleschott. A small minority supported the spiritual monism of Spinoza, Felix Ortt, and Bart de Ligt, for whom not only the organic world but also the inorganic realm was "animated": even, as Gustav Fechner asserted, the whole cosmos.

In the first decade after 1856 most members of De Dageraad were deists (see DEISM) and socially conservative. In the latter part of the century, ATHEISM spread. A considerable minority inclined toward social revolution, while others, such as Adrien Henri Gerhard, became social democrats. In 1883–84 the tension between the followers of a more social approach and the so-called hard atheists came to a head. The radicals, among them the anarcho-socialist Ferdinand Domela Nieuwenhuis, left De Dageraad. Among the more moderate stay-behinds were men like Gerhard, who would in 1894 be prominent among the founding fathers of the Dutch Labour Party SDAP.

Prior to the gradual introduction of a national social security system (starting in about 1900), De Dageraad founded its own life insurance company, Aurora, in 1887; a relief fund for poor freethinker families in 1888; and an orphans' fund to place orphans of freethinkers into freethinkers' families or in a free orphans' house in 1896.

By the early 1900s De Dageraad membership had declined to around five hundred members, though this number included many celebrities. The group's fifieth anniversary in 1906 marked a revival, and by 1908 a new and independent freethought periodical, once again called *De Dageraad*, had joined the existing *De Vrije Gedachte* (Freethought). In 1909 De Dageraad organized protest meetings against the murder of the Spanish anarchist and secular school reformer Fernando FERRER. In 1911 a permanent Commission for Separation from the Church was instituted, whose members gave free legal support to people who wanted to leave their church. Pieter Frowein and Domela Nieuwenhuis were very active at international freethought congresses.

When the freethinker C. J. Vaillant died in 1914, he had himself illegally cremated. The executors of his will, fellow members of De Dageraad, were prosecuted, but in the end the high court acquitted them. From then on, anyone in the Netherlands could demand to be cremated.

From about 1912 De Dageraad mounted growing protests against growing militarism, nationalism, and colonialism across Europe. After the outbreak of war, freethinkers such as the clergymen de Ligt and N. J. C. Schermerhorn and feminist Wilhelmina Drucker vehemently denounced war atrocities. After 1918 this pacifist and antimilitarist movement remained strong among freethinkers, and many became active in the International Anti-Militarist Union.

The postwar years were a boom period for De Dageraad, with increasing membership and new programs including Sunday morning lectures, public debates, brochures, and extensive propaganda tours. Half a dozen printing houses published a steady stream of freethought books. In 1928, a Freethinkers' Broadcasting Society was organized. Among the radio speakers were De Dageraad celebrities such as Gerhard, the jurist and philosopher Leo Polak, and Jan Hoving, the inspiring president of De Dageraad from 1917 until 1938.

As the activities of De Dageraad increased, this prompted opposition from the religious. Confessional groups launched specialized periodicals to fight De Dageraad, such as *De Middaghoogte* (Mid-day Zenith). De Dageraad tried to penetrate the homogenously Catholic southern province of Limburg, where Catholic bishops and priests controlled trade unions, political parties, schools, and the press—a very inhospitable setting for freethinkers and social democrats. The "atheists" from the north were often met with aggressive, sometimes violent counterprotests led by priests.

Major targets of Dageraad protests in the 1920s included the imprisonment of conscientious objectors in the army, the execution of the anarchists Nicola Sacco and Bartolomeo Vanzetti in the United States, Benito Mussolini's fascism, and the pope, because of his 1929

"concordat" with Mussolini. In the 1930s De Dageraad spearheaded the attack on anti-Semitism in Europe. It organized meetings, issued pamphlets, and broadcast radio speeches denouncing all sorts of nationalism and fascism in Germany, Italy, and Spain. Politically and intellectually, 1933 was De Dageraad's "finest hour," and its membership in that year—twenty-seven hundred—has never been equaled. However, in that same year the government forbade all civil servants to belong to "subversive organizations," and De Dageraad was number one on the red list. Repression came not only from Catholics but also from the National Socialist Party. By 1936 the freethinkers' radio broadcasts, always subject to censorship, were prohibited altogether.

However, De Dageraad members remained active, campaigning for the right to say a solemn pledge instead of swearing an oath on the Bible; advocating human-centered morality and education ("humanity first"), a more enlightened approach to sexual morality, and nondiscriminatory marriage legislation; promoting birth control, cremation, the antivivisection movement, and vegetarianism; and pursuing the humanization of criminal law.

After the German invasion of the Netherlands in May 1940, De Dageraad, with its anti-Nazi record, instantly dissolved itself. After the war De Dageraad resurfaced, its periodical *De Vrijdenker* resumed publication, and program activities recommenced. However, two kindred humanist organizations were soon founded: Humanitas (Social Work) in May 1945 and the Humanistisch Verbond (Humanist League) in February 1946. Both appealed explicitly to people outside the churches, but without identifying their position with atheism (see NETHERLANDS, THE, HUMANISM IN). Both humanist organizations soon grew larger than De Dageraad, which today has some twelve hundred members. Relations between humanists and freethinkers, though mutually benevolently critical, can be described as cooperative.

In 1958 De Dageraad changed its name to De Vrije Gedachte (Freethought), and the name of its main periodical into *Bevrijdend Denken* (Liberating Thought). Since 1978 its periodical has been called *De Vrije Gedachte*.

Freethinkers and unbelievers in the Netherlands stand for a nondogmatic, independent, rational, and human way of thinking. Their ideal was and is a combination of freethought and solidarity.

JO NABUURS

NEW ZEALAND, UNBELIEF IN. New Zealand is one of the most secular societies on earth (see SECULARISM). The nationwide census of 2001 revealed a post-Christian society in the making. Of the 3,737,277 census responses to the question of religious affiliation, 1,028,052 described themselves as having no religion and a further 239,241 exercised their right to object to the question. And the vast majority of those who acknowledged some religious affiliation do so in a purely nominal way. At the end of the twentieth century, regular churchgoers accounted for little more than about 15 percent of the population, and those who attended monthly or more frequently are fewer still. Regular churchgoers are usually in the older age cohorts, with those in their twenties being only half as likely to attend church as those over sixty.

While 67 percent of New Zealanders believe in some sort of god, only 47 percent believe in a soul and 43 percent in life after death (see IMMORTALITY, UNBELIEF IN). Sin, hell, and the devil all register much lower levels of adherence. And of those who make some profession of belief in god, a significant proportion attend church never or very rarely.

Most mainline denominations are experiencing consistent decline in membership. The Church of England, once the heavyweight on the New Zealand religious scene, has shrunk the most noticeably. In 1926, 575,731—40 percent of census respondents—claimed adherence to the Church of England, but in 2001, despite a fourfold increase in the country's population, Anglican numbers were just 584,793, or about 21 percent.

The secular nature of New Zealand society is also apparent in the country's politics. Of the twenty-four cabinet ministers who took their posts in 1999, only two swore their oaths on the Bible, and one of those subsequently lost his job over a scandal involving sex with an underage girl. At the time of writing, neither the country's prime minister nor the leader of the opposition is religious. The prime minister's AGNOSTICISM is public knowledge and has never been a relevant issue for the vast majority of voters.

Since the late 1980s there has been an attempt to construct an American-style Religious Right in New Zealand politics, but it has failed to make significant headway. In 1996 an alliance of two right-wing Christian parties formed a coalition to exploit the new proportional representation system New Zealand had adopted, but failed to get the required 5 percent threshold to be represented in parliament. The coalition soon broke up amid acrimony; the Christian Heritage party, its more uncompromising component, rarely rose above 2 percent approval ratings. In 2005 Graham Capill, its leader from 1989 until 2003, was found guilty of the sexual exploitation of underage girls.

By contrast, the United Future Party took pains to describe itself as a secular party of the political center. On this platform it did well in the 2002 election, securing 6.9 percent of the vote and ensuring a place in parliament. But the party soon squandered its election night vote with a series of muddles and scandals, and its voter rating dropped to levels as low as that of the Christian Heritage Party. In July 2003 a still more radical fundamentalist party, called Destiny New Zealand, was formed. It seized attention with a march through Wellington in October 2004 in which its male marchers wore black shirts.

New Zealand has no established church. Among the intellectually oriented of the mostly English and Scottish immigrants who created the modern state in the nineteenth century, the two most influential thinkers were John Stuart MILL and Herbert SPENCER, both staunch agnostics. The influence of these thinkers, and the ascendancy at the time of agnosticism and SECULARISM, were well timed to have a formative influence on the developing national psyche. Some of the most eminent of the early prime ministers of New Zealand were freethinkers. Perhaps the earliest premier whose views were unorthodox was Alfred Domett, who played a formative role in developing New Zealand's secular education system. Domett served as premier between 1862 and 1863. Later in the century rose John BALLANCE and Sir Robert STOUT. Ballance was influential, even after his death, in the long-lived Liberal government of 1890–1906, which did much to shape the growing sense of New Zealand identity. And into the twentieth century, two of the country's most significant prime ministers, Michael Joseph Savage and Peter Fraser, were rationalists (see RATIONALISM). Savage led the Labor Party to a landslide victory in 1935 and enacted a series of sweeping economic and social reforms that helped to drag the country out of the Depression and to construct a comprehensive welfare state. Following Savage, Fraser solidified these reforms and led the country through World War II. Fraser also helped found the New Zealand Symphony Orchestra.

By contrast, very few of the country's prime ministers had been known to be overtly religious. One of the most religious of the country's leaders was Bill Massey, who had links to the bitterly anti-Catholic Protestant Political Association.

The longest-lasting issue that divides religious from secular-minded New Zealanders is the role of religion in schools. The notion of free, secular, and compulsory education is as old as government in New Zealand. The formula was introduced into the province of Nelson in the 1840s, and was developed by Domett into a model the rest of the country would follow in 1877, when, after the demise of the provincial form of government, New Zealand developed a national education policy. The 1877 Education Act was passed by a coalition that represented a wide range of viewpoints. As well as the small groups of agnostics and Jews, a large number of nominally religious people were anxious to create conditions whereby no one religion would exercise unchallenged control in the nation's schools. The safest solution, they reasoned, was that no religion should enter the schools.

Church groups have remained unreconciled to this legislation since its enactment. In 1897 they managed to insert a half-hour slot of religious instruction, during which time the school was deemed to be closed. The questionable legality of this stratagem was in dispute until it was finally legitimized in the 1964 Education Act. Religious instruction is theoretically required to avoid any form of indoctrination and disparagement of other religions, but in practice both of these go on. Bible in Schools, as this program is commonly known, is offered only in primary schools, which teach children up to ten years of age, and only at schools that choose to offer it—it is not compulsory for all New Zealand schools. Parents have the option to withdraw their children from the program, and many do.

The secular nature of New Zealand has posed a tricky set of problems for the country's humanist movement (see HUMANISM). The first problem is how to arouse any interest in the sort of questions that have traditionally motivated humanists. In a society as secular as New Zealand, very few people feel the need to belong to an organization catering to them as nonreligious people. The movement has responded in various ways. The five principal FREETHOUGHT organizations are divided by their respective attitudes toward religion, in particular the degree to which they believe it should be subjected to criticism.

The Skeptics organization is based in Christchurch and focuses on pseudoscience in medicine, the media, and politics. It generally says little about religion. The Skeptics has the best media presence of all the freethought groups in the country. Criticism of religion, promoting the humanist alternative, and defending the secular state have become the main preserve of the Auckland-based New Zealand Association of Rationalists and Humanists. This is the oldest and most well-funded of all the New Zealand freethought organizations. The smaller Humanist Society, restricted to the Wellington region, deals with similar issues. The main organization catering

for religious humanism is the Sea of Faith. This movement was founded by the heterodox English churchman Don Cupitt in 1984 on the strength of a book by that title. It was transplanted into New Zealand shortly afterward by Lloyd Geering, the country's best-known theologian, a radical religious humanist (see RELIGIOUS HUMANISM). There are also small Unitarian communities (see UNITARIAN UNIVERSALISM) that cater to a similar constituency. There is a significant crossover of members between these organizations. Other issues in which humanists have played a part include the debate over voluntary euthanasia, capital punishment, BLASPHEMY laws, and religious pluralism.

BILL COOKE

NEWTON, HUEY P. (1942–1989), African American activist. Huey P. Newton led an erratic and maddeningly inconsistent life in which he constantly vacillated between criminality and heroism. Newton was born in Louisiana, moving with his family to Oakland, California, at age three. He was arrested many times for petty crimes beginning at age fourteen. At twenty-two he was convicted of assault with a deadly weapon and spent most of his six-month sentence in solitary confinement.

Newton eventually taught himself how to read well and attended several Bay Area colleges, earning two associates degrees and helping to found Oakland City College's first black history course. He studied Malcolm X, Mao Tse-tung, Che Guevara, Frantz Fanon, and other revolutionary thinkers.

In 1966 Newton helped found the Black Panther Party (BPP), becoming the group's minister of defense. At its peak, the Panthers had more than two thousand members in chapters in several cities throughout the United States. Though primarily known for its militancy and engaging in shootouts with the police, the BPP also operated valuable social services. Panther ideology was based on Marxist-Leninist ideals, a theory that Newton called revolutionary HUMANISM. It included a wholly secular ten-point program of self-determination, full employment, decent housing, education, healthcare, and the like. Newton detested the reactionary bigotry of cultural nationalist groups such as the Nation of Islam, believing that black-led revolutionary organizations must work with poor and progressive whites, Latinos, Native Americans, and other groups.

Newton argued that while people might feel the need for religion in the beginning, science and reason would eventually fill the void created when the folly of religion became manifest. Nonetheless the BPP sometimes formed uneasy tactical alliances with black churches. In his book *Revolutionary Suicide* (1973), Newton eulogized fellow Panther George Jackson, murdered in San Quentin, writing that a person's spirit lives after his physical death, but not "in the superstitious sense." Rather, the person's ideas can be carried forward and others can emulate his or her actions.

Achievement and criminality continued to alternate in Newton's life. In 1968 he was found guilty of killing an Oakland police officer in a shootout, but the case was dropped on a technicality. In 1974 Newton was arrested several times, once on charges of murdering a prostitute. He fled to Cuba, returning in 1977 when he believed a fair trial was possible. Two trials ended in hung juries and he was freed. In 1980 Newton received a PhD in social philosophy from the University of California. The title of his dissertation was "War against the Panthers: A Study in Repression in America." In the 1980s he twice faced charges of embezzling from Panther community programs and was convicted in 1989. Later that year a drug dealer shot him to death in Oakland.

Newton's legacy is kept alive by various Web sites and the Commemoration Committee for the Black Panther Party in Oakland. Despite the sad state of his later life, the photograph of a confident, defiant, and courageous revolutionary Huey P. Newton posing with a gun in his right hand and a spear in his left continues to leave a lasting impression on the minds of millions.

NORM R. ALLEN JR.

NIETZSCHE, FRIEDRICH WILHELM (1844–1900), German philosopher. In 1882 Friedrich Nietzsche wrote, "God is dead." Nietzsche was an enemy of all religions, but particularly of the religion that surrounded him in nineteenth-century Europe, Christianity. His engagement with Christianity goes far beyond the vitriolic attacks for which he is known, however. It is a theme he returned to again and again throughout his published works: in his criticism of Christian morality, in his analysis of the psychological and cultural impact of Christianity, and in his creation of a compelling portrait of a life without Christianity.

Life. Nietzsche was born near Leipzig, Germany, on October 15, 1844. His family was solidly Protestant—his father and both grandfathers were employed as ministers in the Lutheran Church—but the family was not fanatically religious. When Nietzsche was four years old his father died, an event that left a deep impression on the young boy. In keeping with his passionate and sensitive nature, Nietzsche had been an earnestly pious boy, but by age eighteen he was already an unbeliever.

Nietzsche achieved early recognition as a brilliant scholar of the Latin and Greek classics, being appointed to the chair in classical philology at the University of Basel when he was only twenty-four. As his interests shifted toward philosophy and the analysis of culture, however, his professional colleagues were increasingly baffled by his writing. At first he was able to find an audience among people who shared his admiration for the philosopher Arthur SCHOPENHAUER and the composer Richard Wagner. After his philosophy diverged from these influences, however, he became increasingly intellectually isolated, until eventually there was almost no one among his contemporaries who sympathized with his work.

During his adult life Nietzsche suffered from frequent, debilitating migraine headaches and other illnesses that forced him to resign his professorship at Basel in 1879. After that he lived a seminomadic and largely solitary existence, staying in boarding houses in the Swiss Alps during the summer and in southern France or Italy during the winter. Once he had distanced himself from the academic community and from Wagner's sphere of influence, the elements of his mature philosophy emerged quickly. In between bouts of illness he wrote continually, existing in an almost constant fever of creativity for ten years. His major works were all written during this period.

In January 1889 he suffered a mental breakdown from which he never recovered. From periods of lucidity punctuated by violent outbursts, his condition gradually deteriorated until he was entirely unresponsive, apparently capable of neither thought nor emotion. He died on August 25, 1900. Nietzsche's madness accomplished what his brilliant writing had not: it brought his ideas to the attention of the reading public. In 1888 an influential critic had begun to comment on his work, and, aided by the romantic image of their author in the grip of insanity, his books quickly rose in popularity.

Critique of Christianity. Nietzsche's scathing criticism of Christianity is directed toward precisely that element of Christianity that people usually find the most appealing, namely, its moral code. Nietzsche saw Christian morality as based on two fundamental principles, both of which he condemned. First, Christianity values altruism: sacrificing one's own good for the good of others is praised. Second, Christianity defends the weak against the strong: dominating people weaker than oneself is condemned.

Nietzsche's objection to altruism is based on his analysis of its psychological consequences for the person acting altruistically. The Christian demand that people ignore their own needs and selfish desires in favor of helping others ends up destroying the altruist's independence and individuality, Nietzsche believed. The result is what he calls "herd men" or "last men": people so alienated from their own desires that they are unable to set goals for themselves. They are dependent on the authority of God or society to tell them what to do, and incapable of the sort of productive selfishness that leads to great art or new ideas.

Nietzsche's objection to Christianity's defense of the weak is based on his theory of the will to power. In his view, the defining characteristic of the living human being is the desire to make the world around oneself reflect one's unique personality. Nietzsche called this desire to exert influence on the world the "will to power." Christians are expected to suppress their own desire for power; in Nietzsche's view, this amounts to a form of self-mutilation. The weak, whose will to power is exhausted, are already mutilated in this way, and Nietzsche seemed to have little hope that they could regain their human potential.

Nietzsche's perception that Christianity favors people who are half-destroyed over people who still contain the possibility for greatness gave rise to his most fundamental criticism of Christianity: that it is permeated by contempt for the life we really have here on earth. Christians view life on earth as an inferior prelude to an ideal afterlife in which they will dwell in eternal bliss, freed from the sufferings and unruly desires of their mortal bodies. Nietzsche's concept of the "eternal recurrence" is meant as a counterideal to this concept of a heavenly afterlife. Someone who truly loved life, Nietzsche contended, would not desire the eternity promised by Christianity, but would rather desire the life he or she actually experienced, with all the suffering and unfairness that accompany any human life, repeated over and over again eternally. The first edition of *The Gay Science* ends with

this question: "How well disposed would you have to become to yourself and to life *to crave nothing more fervently* than this ultimate eternal confirmation and seal?"

Values without Christianity. Nietzsche's rejection of the Christian life immediately raises the question of what sort of life would be better. In *Thus Spoke Zarathustra*, Nietzsche borrowed the messianic rhetoric of the Bible to describe the sort of person who represents his ideal, the *Übermensch*, or superhuman (often rendered in English as "Overman"). One characteristic of the *Übermensch* has already been mentioned, namely, the ability to confront the suffering in one's life honestly and yet joyfully embrace that life as a whole. In addition, the *Übermensch* is able to choose independently what values will guide his or her life rather than living in accordance with a moral code dictated by an outside authority. These two characteristics are deeply intertwined, since one's values are the standard by which one judges whether or not one's life has been good. Nietzsche conceived the *Übermensch* as an individualist whose life goals are the result of a complex interplay between an honest assessment of the unique person he or she is and a vision of the person he or she could be.

The picture of life without Christianity embodied in the *Übermensch* concept provides only a formal criterion by which to assess whether one has led a good life: one's personality, one's values, and the events in one's life must form a coherent whole. However, this criterion seems to permit some sorts of life that most people would find reprehensible, for example, a life dedicated to the enjoyment of other people's pain. This possibility is particularly worrying in light of Nietzsche's rejection of Christian morality, which had placed strict limits on the acceptable treatment of other people. Nietzsche's motivation for holding this disturbing position is best understood by examining his claim that God is dead.

In proclaiming the death of God, Nietzsche was not only celebrating the independence of the unbeliever, but also responding to the cultural circumstances of modernity. He thought that an intellectually honest belief in God is no longer possible, and his philosophy is in part an attempt to come to terms with the implications of this fact. The significance of the death of God is twofold. First, it means that there is no one with the authority to demand conformity to any particular set of values. The individual's free commitment to them is the only real ground for the principles that guide his or her choices. This commitment must be responsive to the peculiarities of the individual's situation and personality, so there can be no universally applicable rules about what sorts of life are permissible. Second, Nietzsche believed that an authentic commitment to the altruistic moral code of Christianity is impossible because this code requires the individual to reject the needs and desires that form the basis of his or her unique identity. To accept the Christian ideal as the model of a good life is to will one's own death.

The nineteenth-century atheists who were Nietzsche's contemporaries believed that they could renounce belief in God without giving up the moral framework that gave meaningful structure to their lives. Nietzsche predicted that this moral framework would crumble without God at its center. His ultimate message to his reader is this: If your life is to be meaningful, you must create that meaning yourself.

NIHILISM. In his poem "McDougal Street Blues," Jack Kerouac wrote, "Nobody believes that there's nothing to believe in." But there actually have been people over the eons who have literally believed in nothing. Called Nihilists, they give new meaning to the word *unbelief*. *Nihilism* (from the Latin *nihilo*, meaning "nothing") has been an important worldview for several centuries and has been a central concern to philosophers, theologians, novelists, poets, and psychologists since at least the late nineteenth century, when Friedrich NIETZSCHE wrote: "God is dead and we have killed Him."

There are various types of nihilism that must be differentiated, including the following: (1) epistemological nihilism, the denial that there are any objective or reliable grounds of determining what is true; (2) ethical nihilism, the denial that there are any objective moral norms or systems that one must accept; (3) political nihilism, the denial that there are any political structures or laws to which one must pay allegiance; (4) metaphysical nihilism, the theory that the universe is meaningless; (5) axiological nihilism, the theory that nothing has any value; (6) praxiological nihilism, the theory that nothing is worth doing; and (7) semantic nihilism, the theory that

language is so imprecise that all statements are ultimately meaningless. What all of these have in common is the view that, as the rock group Queen put it in their song "Bohemian Rhapsody," nothing really matters.

One of the earliest discussions of nihilism is found in PLATO's dialogue *The Gorgias*. In it, the Sophist Gorgias (see SOPHISM), famed for his rhetorical skills and his ability to make the most absurd position seem plausible, declares that human beings cannot know if anything exists at all, and even if we could, we would not be able to communicate this knowledge, due to the inadequacy of human language. While Gorgias seems not to take his own argument seriously, other Ancient Greek philosophers, especially the Skeptics (see SKEPTICISM), were apparently in earnest when they made similar claims. Cratylus, for instance, was said to have refused to answer any questions, since he could not be certain of their meaning, and would only wiggle his finger to indicate that he did acknowledge receiving some sort of stimuli in the air. Even this concession was too much for the most extreme Skeptics.

Such discussions remained purely theoretical until the rise of modern philosophy in the seventeenth century. René DESCARTES's methodological skepticism called into question all beliefs about the external world, including God's existence. While Descartes thought he could restore such beliefs on a step-by-step basis through logical argumentation built upon a foundation of certain knowledge, there were those who found his philosophy a liberating approach to all dogmatic thinking (which is one reason why his works were placed on the Vatican's Index of Forbidden Books). Cartesianism thereby made epistemological nihilism one of the most troubling puzzles for students of cognition ever since. As Senator Howard Baker would phrase it during the Watergate trials, What do we know and when do we know it? And how can we know if what we know is true?

It was Nietzsche who made ethical nihilism a major concern for moralists. If God is dead, he argued (meaning not a literal supreme being but rather the belief in such a being), then any moral system sanctioned by God must also be dead. Or, as Fyodor Dostoyevsky (the most famous novelist to grapple with nihilism) put it in his masterpiece *The Brothers Karamazov*, "If God is dead, everything is permitted." Such a nihilistic view of morality has been attributed to Nietzsche himself, but it is important to note that Nietzsche was an opponent of nihilism, which he felt to be ultimately a worldview that led only to despair and inaction. For him, the will to power and the desire to bring about a life-form superior to present-day humans (the *Übermensch* or Overman) were inspirational moral codes based upon the natural laws of the universe. These would replace the Christian concepts of compassion and the role model of a suffering Christ. Nietzsche was sympathetic to the Buddhist notion of nothingness, but found it too anemic and too pacifistic for his own taste. But he recognized that without some belief system to guide them, humans would necessarily come face to face with the void, and the likely outcome would be horrifying. To replace the Christian concept of an afterlife, he proposed the idea of eternal return, the view that one leads the exact same life over and over, and thus is never really dead. Nietzsche scholars have debated ever since whether he was sincere (which is to say, did he *really* believe this?) or whether he was offering up one myth to replace another.

Political nihilism was a force identified with the Russian radical Mikhail BAKUNIN, who extolled the virtue of violence and the need to overthrow all political systems. The Russian novelist Ivan Turgenev captured this attitude in the character of Bazarov in his 1862 book *Fathers and Sons*, thereby creating the most noted fictional nihilist. There were close connections between nihilism and the anarchist movement of the nineteenth and early twentieth centuries (see ANARCHISM AND UNBELIEF), several of whose members assassinated such world political leaders as Czar Alexander II of Russia, US president William McKinley, French president Sadi Carnot, and the Empress Elizabeth of Austria. But not all anarchists were necessarily nihilists—most believed in the natural goodness of human beings and eschewed violence. And not all political nihilists were necessarily anarchists—if all political systems are corrupt, what is the use of overthrowing them, just to have them replaced by ones equally untenable? No government can be just as bad as any government. Cynicism is also compatible with political nihilism, as is passivity. What difference would it make to change political regimes if nothing really matters at all?

The German philosopher Martin Heidegger gave perhaps the strongest arguments for metaphysical nihilism, in his 1927 work *Being and Time* (which directly influenced the Existentialist philosophers, particularly Jean-Paul SARTRE, who furthered the discussion in his 1943 work *Being and Nothingness*). Heidegger followed from Nietzsche's lead, but claimed that Nietzsche himself had not worked out the full implications of what it means to look into the abyss, that is, to try to grapple with the very meaning of "Nothingness." Nietzsche's will to power is a metaphysical dodge, an attempt to replace God with an equally Unconditioned Force whose origin remains mysterious. Philosophy must confront the meaninglessness of the world, and try to understand what existence itself means. Existentialists like Sartre and Albert CAMUS took up the challenge by advocating living authentic lives in defiance of an absurd universe (see EXISTENTIALISM), but Heidegger himself retreated into mysticism, noting in an interview (significantly, published posthumously) that "[o]nly a God can save us now." Although he spoke often of death as a person's final project, philosopher Paul EDWARDS, in his book *Heidegger's Confusions*, shows that he left open the possibility of survival after death. Thus, Heidegger was guilty of the same offense he accused Nietzsche of committing—not having the courage of his own convictions.

Axiological and praxiological nihilism are interconnected—if there is no value in the universe, it follows that there is nothing worth doing. Camus, who said that the only real philosophical question remains "Why not commit suicide?" offered up the myth of Sisyphus in response—while we may be doomed to perform actions that outwardly have no meaning or significance, we still inwardly feel that such actions have worth. We authenticate ourselves through freely choosing our own identities. To avoid doing so, to try to take on social roles just to please others, is, Sartre further argued, to be guilty of bad faith. Still, even the existentialists were found wanting by more hard-core nihilists, such as the punk rock group the Sex Pistols, who announced the end of hope and sang, "There's no future for you." But, pragmatically speaking, such a literal dead-end was not sincerely embraced by many, who preferred to sing about rather than jump into the void. Even Sex Pistol Sid Vicious seems to have died of an accidental drug overdose, not by deliberate suicide. If nothing matters, then why write songs about it? Surprisingly enough, nihilism was one of the main motivating forces for artists of the late twentieth century. In the words of the Nobel Prize winner Samuel Beckett—the premier absurdist writer of that period—"I Can't Go On . . . I'll Go On."

As for semantic nihilism, philosophy in the twentieth century was dominated by the analysis of language (what Richard Rorty called "the Linguistic Turn"). But it soon became clear—as Plato had understood many centuries earlier—that the correspondence between words and things is tenuous at best. Perhaps the best example of semantic nihilism was found in Ludwig WITTGENSTEIN's 1922 *Tractatus Logico-Philosophicus*, which argued that the limit of our language is the limit of our world, and that the most important matters of life cannot be put into words. A nihilist could well take this to mark the death of all writing, yet somehow the publishing industry did not come to a halt, and in fact the number of books written about Wittgenstein and language is sufficiently large to fill a good-sized library.

When all is said and done, nihilism in its many versions remains a conundrum. Like the Cyclops blinded in Homer's *Odyssey*, who cries out loudly that "Nobody" blinded him, all thoughtful truth seekers must admit, when asked what most troubles them, that the answer is "nothing at all."

TIMOTHY J. MADIGAN

NOAH'S FLOOD AND UNBELIEF. Noah's Flood refers to an event described principally in Genesis 6–8 of the Bible. According to Genesis 6:1–4, divine beings seduced or raped human women who consequently produced a mutant race called the *Nephilim.* The biblical god, Yahweh, thereafter decided to destroy all life, except the righteous Noah and his family.

Late Antiquity and the Middle Ages. Perhaps the earliest recorded instance of unbelief in Noah's Flood is found, albeit opaquely, in the Bible itself (e.g., Matt. 24:37–39). But it is in *Against Celsus*, the famous pro-Christian manual written by Origen, that we find the earliest report of substantive attacks on the biblical Flood story. According to Origen, the anti-Christian polemicist Celsus made at least three arguments: (1) Its monstrous size renders the Ark unseaworthy; (2) the Ark could not contain so many animals; and (3) the story seems borrowed from the Greek story of Deucalion.

The influential theologian Augustine also recorded skeptical comments in his *City of God*, including the improbability that rain could fall on the highest mountains given that clouds are too light to hold together at such a height. Augustine himself argued that not every animal needed to be on the Ark, especially those that can be produced by spontaneous generation. The existence of animals on distant islands also troubled Augustine; he suggested the possibility that angels transported those animals.

Meanwhile, Jewish writers also recorded bothersome questions about the Flood. In *Antiquities of the Jews* (first century), the Jewish historian Flavius Josephus cites a number of Babylonian sources including Berossus, a Babylonian priest of the fourth century BCE, in an apparent attempt to confirm the authenticity of the biblical account. The great medieval Jewish commentator Rashi asked why God would ask Noah to build an ark when there were so many other ways to save him.

The Renaissance and the Enlightenment. The discovery of the New World during the Renaissance produced a new set of problems for belief in Noah's Flood. Skepticism originated less in antibiblical writers than in writers who attempted to harmonize biblical accounts with Europeans' encounters with animal species and peoples in the New World and in Australia. Some asked why these animals weren't found in the Old World. How did animals manage to arrive at Noah's Ark from isolated and distant areas such as Australia? One response to such questions is elaborate mathematical calculations designed to defend the feasibility of Noah's Flood. Thus, Johannes Buteo in *De Arca Noe* calculated that the interior of the Ark contained 350,000 cubic cubits of usable space, and so could accommodate any species known. A local flood,

rather than a worldwide inundation, began to be envisioned in order to suppress questions about the amount of water that would have been required for water to rise fifteen cubits above the tallest mountains.

The Nineteenth Century. By the early nineteenth century, the science of geology had matured sufficiently to pose a direct challenge to belief in Noah's Flood. It was becoming obvious that most extinct species represented by fossils, many of which had been conceived as remnants of Noah's Flood, were never accompanied by traces of human presence. Thus, some scholars reasoned that there were prehuman extinctions, as well as a lengthy history of the earth prior to human habitation.

One early pioneer of geology, the Frenchman Georges Cuvier, synthesized scientific evidence showing that the earth had sustained a series of catastrophic events that had extinguished some forms of life, and that these were followed by the appearance of unprecedented forms. Though Cuvier would still identify the latest of these catastrophes with Noah's Flood, he diminished the privileged position of the Flood in explaining extinctions. By 1831 Adam Segdwick, the influential president of the Geological Society (England) had openly decried the folly of giving credence to Mosaic accounts at the expense of what is observed in nature.

"Christian Geology." The revolution in geology in the nineteenth century resulted in the vigorous promotion of a pro-Christian version of geology in the twentieth century, especially in the United States. One of the most famous proponents was George McCready Price, a Seventh-Day Adventist who wrote *The New Geology* (1923) and founded the Deluge Geology Society. His most prominent successors were John C. Whitcomb and Henry Morris, authors of *The Genesis Flood* (1961), which became the standard statement of what is sometimes known as "Flood Geology," itself part of a broader response to evolution. Many creationists argue that Noah's Flood can explain the order of all fossils in the stratigraphic record.

Modern Archaeology. Archaeology confirms that there exists no global discontinuity in human habitation at the time to which most believers date the Flood (10,000–5000 BCE). A single archaeological stratum should be correlated around the globe recording such an interruption in human habitation. The famous British archaeologist Sir Leonard Woolley did claim to find evidence of Noah's Flood at Ur in Mesopotamia. But this announcement was soon reversed when it became obvious that even other parts of that city had not suffered flooding. Nonetheless, Woolley's premature claim is cited in many Christian apologetic books.

Modern Biblical Scholarship. Detecting the multiple and contradictory sources behind the biblical account of Noah's Flood is probably the main contribution of modern biblical scholarship, which had crystallized by the late nineteenth century. For example, in Genesis 6:19, Noah is commanded to bring aboard the Ark one male and one female member of every kind of animal. In 6:22 the author informs us that Noah completed this task ("Noah did this"), but Genesis 7:2 introduces a new command to bring aboard *seven* pairs of clean and one pair of unclean animals, which is nonsensical if there was already one pair of every kind aboard. For these and other reasons, the consensus of modern scholarship is that variant flood stories have been combined.

The discovery of Mesopotamian flood stories, beginning in the nineteenth century, confirmed that biblical accounts were variants of earlier nonbiblical flood stories reaching back to the third millennium BCE. The most famous of these is found in the epic of Gilgamesh, a copy of which was found in the library of the Assyrian king Ashurbanipal at Niniveh. That story also features a hero, Utnapishtim, who is told to build a boat to save himself from a flood about to be sent by hostile gods. After the flood subsides, Utnapishtim sends out three birds (Noah sends two), and the boat comes to rest on a mountain. As in the case of Noah, Utnapishtim offers sacrifices after his exit from the boat.

The Mass Media and Unbelief in Noah's Flood. The mass media has become another venue for debate about Noah's Flood. One interesting example is the television "documentary" *The Incredible Discovery of Noah's Ark* (1993), produced by Sun Pictures under the aegis of David Balsiger, author of other dubious efforts to support biblical beliefs. Soon after the program's broadcast on CBS, skeptic George Jammal announced that he had manufactured some of the items that were touted as relics of Noah's Ark in that program. Jammal helped to expose the fact that many Christian apologists, including the noted creationist John Morris (who, at one point, apparently accepted Jammal's artifacts as authentic), were uncritical in evaluating data.

Otherwise, there have been many sensationalized reports of sightings or visits to the Ark. In the 1950s French businessman Fernand Navarra, author of *Noah's Ark: I Touched It* (1974), claimed to have visited the Ark and brought back wood from it. The American astronaut James Irwin, who walked on the moon as part of the Apollo 15 mission in 1971, mounted a few expeditions to Mount Ararat in the 1980s and wrote *More Than an Ark on Ararat* (1985).

Recent Developments. In 1998 two oceanographers, William Ryan and Walter Pitman, published *Noah's Flood: The New Scientific Discoveries about the Event That Changed History*, which argued that a real inundation that created the Black Sea around 5600 BCE underlies both the Mesopotamian and the biblical accounts. Ryan and Pitman claim that most people survived this flood because there was enough time to flee to safer areas. However, among other problems, Ryan and Pitman provide no scientific criteria to distinguish a genuinely preserved memory from a subsequent literary creation. For example, why is there a "memory" about a boat on top of a mountain if thousands of people had no need to escape in a boat at all?

Conclusion. The tsunami of 2004 shows that catastrophes involving water are a recurrent part of the human experience. Therefore, it is not surprising to find flood stories all over the world. Insofar as Noah's Flood is concerned, the fact remains that there has never been found either a single layer of flood destruction that can be correlated around the globe, or definitive evidence of an ark on a mountain. In short, there is no evidence for the occurrence of Noah's Flood, while a veritable flood of evidence points to its legendary character.

HECTOR AVALOS

NONCOGNITIVISM. Noncognitivism is the philosophical view that certain classes of sentences are not cognitive (or cognitively meaningful). For a sentence to be cognitive, it needs to be the kind that can express knowledge, which implies expressing a proposition. (A proposition is any set of ideas that is true or false, can be believed or disbelieved, asserted, and employed in reasoning, and which can be regarded as the meaning of a declarative sentence. An example would be the proposition that snow is white.) When noncognitivism claims that certain classes of sentences are not cognitive in that sense, it is saying that their declarative form is misleading, concealing their true import. Instead of stating something true or false, as they appear to do, such sentences actually fail to convey any literal meaning. The main candidates for the classes of sentences deemed to be noncognitive are value judgments and religious utterances. When dealing with unbelief, the focus is on declarative sentences that contain the word *God* (sometimes referred to as God-talk). Noncognitivism in this context (theological noncognitivism) is the view that God-talk is noncognitive; in other words, it fails to express any proposition or anything that is true or false.

Noncognitivism needs to be distinguished from ATHEISM, taken as the view that God does not exist (sometimes called positive atheism). According to atheism in that sense, the sentence "God exists" does express a proposition but a false one. In contrast, noncognitivism says that the sentence "God exists" expresses no proposition whatever. Whereas atheists maintain that people's concept of God does not match anything in reality, noncognitivists maintain that there is no such thing as a concept of God, the word "God" itself being literally meaningless. On the other hand, if atheism were instead simply defined as the absence of theistic belief (sometimes referred to as negative atheism), then it would include noncognitivism (along with AGNOSTICISM and positive atheism). The earliest defense of noncognitivism was by Charles BRADLAUGH, though he referred to it as atheism. The earliest use of the term *noncognitivist* was by Rudolf Carnap.

The view most closely associated with noncognitivism is LOGICAL POSITIVISM, which advocates the principle that a statement is literally meaningful (i.e., cognitive) if and only if it is either analytic or empirically testable, as stated by Sir Alfred Jules AYER. This principle is objectionable for many reasons. First, it is unclear what a statement is supposed to be. If it is a proposition, then it is not the sort of thing that could be called meaningful or meaningless (since it is already a meaning of a certain sort). And if it is a sentence, then it is not the sort of thing that could be said to be testable (or verifiable), those terms being applicable only to propositions. Second, since only propositions could correctly be said to be untestable, the untestability of something cannot be used to show that it fails to express a proposition. In other words, if there is no proposition there, then there is nothing there that could be said to be untestable, so testability/untestability cannot be a criterion of cognitivity/noncognitivity. A third objection often raised is that, for various reasons, it is unclear just what it is for something to be empirically testable. A good critique of logical positivism is given by Paul Edwards.

The question might be raised whether contradictions are cognitive. As *cognitive* is defined above (requiring merely that there be a proposition expressed), contradictions are indeed cognitive, for they do express propositions and are usually regarded as false. (Every contradiction is a conjunction of two propositions, and every conjunction of two propositions is itself a proposition.) The logical positivists regarded analytic sentences to be cognitive. If *analytic* includes analytically false as well as analytically true, then contradictions would be included, for they are analytically false. On the other hand, the term *cognitive* might be taken to mean "expressing a thinkable (or conceivable) proposition," in which case contradictions would be excluded. This alternate usage of cognitive is discussed elsewhere; let us disregard it here, as it is not the most common usage and it would take us too far afield.

A Transcendent God. Whether or not God-talk is cognitive (expressive of propositions) depends on how God is defined. Consider the following definition (call it D1):

> D1: God is the omnipotent, omniscient, transcendent, nonphysical, personal being who created the universe out of nothing and currently sustains and rules it.

Is the sentence "God exists" cognitive when God is defined as in D1? In other words, does the sentence

express a proposition? It might be argued that some of the given properties are incompatible with each other. For example, being omnipotent might be incompatible with being omniscient, since an omnipotent being can make himself ignorant, whereas an omniscient being cannot do that. Consider also the property of being transcendent, that is, existing outside (or independent of) space and time. It might be argued that a personal being cannot possibly be transcendent since a personal being needs to be a particular entity that is able to perform physical actions within space and time, whereas something that is transcendent cannot be or do such things. (Similar considerations could be raised with regard to the property of being nonphysical.)

The issue of whether the properties in definition D1 are compatible with one another will not be pursued here. Even if they are incompatible, the sentence "God exists" would still express a proposition (albeit a necessarily false one). It need not be a contradiction (or analytically false), as there are other kinds of incompatibilities between properties, but there would definitely be a false proposition there, indeed one which could be proven false. Hence, the sentence "God exists," taking God as in D1, would still be cognitive (or literally or cognitively meaningful) even if the properties in the definition were incompatible with one another.

In order to prove that the given sentence fails to express any proposition whatever, one would need to show that at least one of the individual terms within D1 is itself incomprehensible. Some have argued that *omnipotent* or *omniscient* is meaningless. However, if that just means that the given term is self-contradictory, then we are back to the situation of incompatible properties. For example, suppose it is argued that "omnipotent" is meaningless because an omnipotent being would need to be able to make himself weak, but for an omnipotent being to be weak would be a contradiction. Even if this were a good argument, all it would show is that "omnipotent" is a self-contradictory concept, which would make "God exists," as understood in terms of D1, a self-contradictory statement. As seen above, that is not enough to make the sentence noncognitive.

A more likely target would be the term *transcendent*. What possible sense could be attached to "being outside (or independent of) space and time"? Even physicists who speak of other forms of time do not go so far as to speak of something being totally outside (or independent of) space and time. Maybe a sense could be attached to the term if it is applied to abstractions. Might it be said of numbers, for example, that they are independent of space and time? It is a controversial issue, but let us be charitable and say that there are things (abstract entities such as numbers) that are transcendent. At least that would allow the term "transcendent" to have some meaning or use and would make a sentence of the form "X is transcendent" cognitive, for there would then be some proposition expressed by it. Of course, there would remain the problem of whether "X is transcendent" is compatible with "X is a personal being," but that is a separate issue, and, as shown above, not relevant to the cognitivity of "God exists," as understood in terms of definition D1. The verdict is still out, but there is reason to maintain the cognitivity of "God exists," understood in the given way.

Other Definitions. Consider the following three alternate definitions of God:

> D2: God is that being which is absolutely perfect in every way.
>
> D3: God is that being which is self-existent, that is, which contains the explanation for its own existence within itself.
>
> D4: God is the ultimate ground of Being, which cannot be positively characterized in any way.

Each of these presents additional problems. The question for each definition is whether or not it would allow the sentence "God exists" to express a proposition. If "being perfect" is a subjective predicate, as seems reasonable, then it appears that definition D2 would fail in that regard. The sentence "God exists," taken in that way, would turn out to be noncognitive.

Similarly, definition D3 would be a failure if no literal meaning could be assigned to "X contains the explanation for its own existence within itself." Philosophers and theologians have made some effort toward clarifying that clause, but their work remains dubious and controversial. If they fail, then "God exists," taking God as in D3, would also need to be regarded as noncognitive.

As for definition D4, several problems arise. There is, first, the problem of comprehending what Being is supposed to be. Then there is the problem of understanding the idea of an ultimate ground and, in particular, the expression "the ultimate ground of Being." Finally, there is the question whether any concept is defined when no positive characteristics are assigned to it. If all we are told is that God is not this and not that, and so on, running through every predicate in the language, then what are we left with? Philosophers have complained that the so-called *via negativa* necessarily fails to define any concept, and the complaint seems legitimate. In that case, no proposition is expressed by "God exists" when God is defined by D4, and the sentence is properly characterized as noncognitive.

Each of these issues is complex and ongoing, but there certainly is point to the charge that "God exists" is sometimes noncognitive. There is merit to the hypothesis that although the anthropomorphic God-talk of everyday people in ordinary language is cognitive, at least some of the arcane God-talk of theologians (and some philosophers) is noncognitive. In any event, the issue of the cognitivity of God-talk needs to be addressed on a case-by-

case basis, with very close attention given to the exact definition of God supplied.

We are left with a question of statistics: What proportion of the uses of the word "God" by people speaking or writing English would allow the sentence "God exists" to express a proposition and thereby be cognitive? In other words, what proportion of God-talk are cognitivists right about, and what proportion of it are noncognitivists right about? There have been no specific studies directed at these questions, but the proportion in each case seems to be significantly greater than 0 percent and significantly less than 100 percent. My own rough guess is that about half of all God-talk that actually occurs is cognitive and another half (mainly in the speech and writings of theologians and philosophers) is noncognitive.

THEODORE DRANGE

NORWAY, UNBELIEF IN. In 2000 Norway had a population of about 4.5 million. The official religion is Evangelical Lutheranism, to which 86.2 percent of the population belonged in 1999. Other Protestant and Catholic groups had 3.8 percent; other religious groups, 5.2 percent; and "none," 4.8 percent.

ATHEISM was slow in coming to Norway. Jo Gjende, an early freethinker (see FREETHOUGHT), seems to have been a deist (see DEISM) from about 1830 on. Marcus M. Thrane, "the first Norwegian socialist" and another early freethinker, claimed to believe in God, but his concept of God was so devoid of content that Thrane undoubtedly was very close to atheism. Søren Jaabæk, a well-known peasant politician, was a sharp critic of organized religion, but he continued to believe in God.

The famous playwright Henrik Ibsen seems to have been an atheist as an adolescent, but later seemingly became a deist. Another famous author, Knut Hamsun, seems to have been an atheist as a young man, and perhaps also later in life, but in old age he seemingly returned to his childhood religious faith.

A few stable forms of atheism established themselves in Norway from around 1870 on. The biologist Gerhard Henrik Armauer Hansen seems to have been an atheist from around 1870 to the end of his life. He was influenced by Charles DARWIN, as was the zoologist, explorer, and humanitarian Fritjof NANSEN, an atheist most of his life.

The author Arne Garborg seems to have been a reluctant atheist from about 1873 on. He arrived at his basic beliefs through religious thinking and religious doubt. The author Alexander Kielland was a sharp critic of organized religion and seems to have been an atheist from the 1880s on. Another radical author, Hans Jæger, seems to have been an atheist from about 1878 on.

The shipowner and politician Christian Michelsen, prime minister of Norway between 1905 and 1907, can probably be best described as an agnostic for most of his adult life.

Throughout most of the nineteenth century, there was very limited freedom of expression and no real freedom of religion in Norway. Everyone was expected to be Lutheran. Widespread suspicion was directed against everyone who was not, particularly against Jews, Catholics (especially Jesuits), and of course freethinkers and atheists. Until sometime between 1850 and 1870, atheism was commonly considered unthinkable and popularly linked with immoral behavior. For the rest of the century atheism remained a rare phenomenon. Even in the first decades of the twentieth century, atheism was rarely advocated openly and continued to be associated by its adversaries with immoral behavior.

The growth of atheism was stimulated by Darwinism, by religious doubts for which no satisfactory answers could be found, by a growing awareness of the multiplicity of religions all claiming to represent the truth, and by internal and external criticism of religion, including Marxist criticism (see MARXISM). Friedrich Nietzsche's atheism, known in Norway since about 1890, stimulated the growth of Norwegian atheism only to a very limited extent.

Beginning in or just before the 1920s, atheism came to be taken for granted in some circles, often stimulated by Marxism, growing knowledge of the natural sciences, astronomical discoveries, common sense, and rising awareness of the existence of moral systems without any religious foundation.

Apart from some freethought clubs that sprung up between 1911 and 1915, nonpolitical atheism generally remained unorganized in Norway until the Human-Etisk Forbund (Human-Ethical Society) was established in

1956. Then, in 1974, Det Norske Hedning-Samfunn (Norwegian Society of Heathens) was established. Both organizations still exist. Human-Etisk Forbund, with about sixty thousand current members, may be the largest freethought society in the world, whereas there are about three hundred registered Heathens.

According to Norway's Central Bureau of Statistics, in 1999, 86.2 percent of Norwegians belonged to the Norwegian Lutheran State Church, as noted above. This means that in that year, 13.8 percent of the Norwegian population did not belong to the state church. These nonmembers belonged either to another religious organization, or organizations such as Human-Etisk Forbund and Hedningsamfunnet, or did not belong at all. (As recently as 1970, as much as 95.1 percent of the population belonged to the Norwegian Lutheran State Church.)

Survey studies of the Norwegian population suggest that in the 1990s about 70 percent of the population had a religious belief of some kind, believing in a personal god, spirit, or life force, whereas about 30 percent did not have such a belief. About 30 percent of the population believed in a personal god, that is, a god who cares about the fate of each individual. Also, up to 30 percent of the population did not believe in any god, and thus were atheists in the broad sense of the word.

Survey studies indicate that in 1997, 16.9 percent of the members of the state church were atheists in the sense of not believing in any god.

NYSTRÖM, ANTON (1842–1931). See **SWEDEN, UNBELIEF IN.**

OFFEN, BENJAMIN (1772–1848), American freethought activist, lecturer, and author. Benjamin Offen was born in Sussex, England, to a farming family on December 30, 1772. He was self-educated and worked on his family's farm until the age of nineteen, when he then began training as a shoemaker. At the age of twenty-two he completed his training and eventually moved to London to ply his new trade. After opening a shop and trying several religions (he was unsatisfied with those he experienced) he and his family immigrated to West Point, New York, and later moved to New York City in 1824.

Upon his arrival in New York City, Offen began his vocation as a freethinker. In 1827 he helped create the Freethought Press Association (FPA) and became its president. He began to lecture and debate on various freethought topics, but his specialty seemed to be BIBLICAL CRITICISM. The FPA disappeared in 1829, and Offen reappeared as a contributor and lecturer for the Society of Moral Philanthropists.

The Society of Moral Philanthropists conducted lectures and debates on Sundays in Tammany Hall, and Offen was a regular lecturer for over ten years. Offen also went on speaking tours, mostly in upstate New York, and continued these "missions" until the early 1840s. During these tours he lectured, debated clergy, and sold freethought books and subscriptions to the various freethought publications published in New York and Boston. His own book on biblical criticism, *A Legacy to the Friends of Free Discussion* (1846), wasn't available until after he ended his speaking tours. Offen was a regular contributor to such freethought publications as the *BOSTON INVESTIGATOR*, *Correspondent*, and the *Beacon*.

Offen worked tirelessly to promote freethought, to the detriment of his shoemaking business, which he seemingly ignored for great stretches of time as a result of his freethought activities. Some of his freethought colleagues (including Gilbert VALE and Frances WRIGHT) held a benefit for him in 1839 to raise funds for him to live on. Despite this lack of funds, Offen retired from shoemaking at the age of seventy. Offen was the impetus for Vale's purchase of sixty acres of Thomas PAINE's farm as a haven for destitute freethinkers.

TIMOTHY BINGA

O'HAIR, MADALYN MURRAY (1919–1995), American atheist activist. Courageous, intelligent, and good company on the right day, Madalyn Murray O'Hair was also abusive, divisive, and a source of strength for the enemies of ATHEISM. Born Madalyn Evalyn Mays on April 13, 1919, in Pittsburgh, Pennsylvania, she was the second child of John Irvin and Lena Christina Mays. The family was quarrelsome and forever short of money, forcing it to move often, either in search of work or to dodge creditors.

World War II opened up a new range of opportunities for people like Madalyn Mays. After a brief marriage to John Henry Roths in 1941, Madalyn enlisted with the Women's Auxiliary Army Corps in January 1943 and found her war service liberating and exhilarating. She returned to the United States in 1945, pregnant following an affair with William Murray, a Catholic officer who then disowned her. The baby, William Joseph Murray III, was born on May 25, 1946. After a while Madalyn started calling herself Madalyn Murray.

Far too intelligent and restless for the narrow range of choices available to women of her generation and background, Murray moved around—physically, emotionally, and intellectually. Having inherited her feisty intelligence from her mother, she graduated with a BA from Ashland College in Ohio in 1948 and a law degree from South Texas College of Law in 1952. Madalyn's second child, Jon Garth Murray, was born on November 16, 1954, the product of a brief liaison with a work colleague after she moved to Baltimore. In 1965 Murray married Richard O'Hair, a shady character with an excessive love of drink. Like all of her relationships, her marriage to Richard O'Hair was turbulent and had long broken down when Richard was diagnosed with cancer in 1977. In the final act of their love-hate relationship, Madalyn nursed Richard right up until his death in 1978.

It was in the mid-1950s, after flirting with communism and trade unionism (see SOCIALISM AND UNBELIEF; LABOR MOVEMENT AND UNBELIEF), that Madalyn Murray found her vocation in atheism. She had concluded that organized Christianity was behind much of the hypocrisy, shallowness, and conformism of American life. The rest of her life was concerned with an idiosyncratic blend of self-promotion and dedication to an unpopular cause.

Madalyn Murray O'Hair, as she came to be known, claimed to be the most significant legal figure of the twentieth century. While this is far from being the case, nothing can diminish her courage during the long struggle that led to the June 17, 1963, Supreme Court decision in *Murray v. Curlett*, which ruled that school prayer was indeed unconstitutional. This decision was hugely important for American education, law, and politics. It helped reshape the American cultural landscape, but was achieved at a high personal cost. O'Hair and her family were the target of ongoing harassment and abuse. Characteristically, though, O'Hair squandered her moral authority as a victim of persecution for her beliefs by advancing a selective account of the legal battle, in particular an unseemly squabble for priority with a concurrent case, *Abington Township v. Schempp*, in which the plaintiffs were practicing Unitarians (see UNITARIAN UNIVERSALISM). O'Hair later claimed that the Supreme Court decision, which responded to both cases together, was an attempt to deny O'Hair and atheism the kudos for the victory.

On the strength of the *Murray v. Curlett* decision, O'Hair founded American Atheists, although a predecessor organization had been founded in 1959. Over the next thirty years O'Hair became one of the best-known opponents of Christianity in American history. In contrast to most other significant non-Christian leaders, O'Hair attracted quite a lot of media attention. This was a double-edged sword for the movement. If all publicity is indeed good publicity, O'Hair's exposure could only be a good thing. But viewed from the perspective of combating old prejudices about atheism, O'Hair's media exposure was to say the least unhelpful.

O'Hair was not reticent in advancing her claims for priority. The O'Hairs were frequently referred to in their own literature as the First Family of Atheism. More specifically, O'Hair described herself as the best-educated, most widely known atheist leader in the United States. Elsewhere, she described herself not simply as *an* atheist, but as *the* Atheist. Declarations such as this were backed up by regular purges of members who were thought to have forgotten that fact. These histrionics notwithstanding, O'Hair did occasionally get it right, as with *O'Hair v. Hill* (1984), where she successfully overturned the discriminatory practice in Texas of requiring state employees and potential jurors to vow a belief in God.

The most serious reversal for O'Hair was the defection of Bill Murray, her son and the person in whose interest *Murray v. Curlett* was originally brought. Bill had never been able to find his feet. He drank heavily and drifted from job to job and woman to woman. Occasionally he returned to O'Hair and American Atheists, only to argue once again with his mother and storm off. He fathered a daughter, Robin, whom O'Hair filed to adopt in 1967, raising her as Robin Murray-O'Hair. Bill "found God" in 1980 and set about forging a career that revolved around trading on his past. With that in mind, in 1982 he published a self-serving tell-all account of his years as an atheist. There were some famous arguments within the ranks of atheism as well. George H. Smith, author of the Objectivist-inclined *Atheism: The Case against God*, was an early casualty. Others came and went, not infrequently people who had won awards at American Atheists conventions only the year before.

Perhaps the most ill-judged, expensive, and counterproductive of O'Hair's legal battles was over the fate of THE TRUTH SEEKER. Once the United States' greatest freethought paper, *The Truth Seeker* was a shadow of its former self in 1981 when O'Hair suggested to James Hervey JOHNSON that she take the paper over and inherit its substantial capital assets. Johnson turned the offer down. O'Hair ruminated on this for several years before engineering a takeover of the paper in 1987 that provoked a squalid contest that was still under way when the O'Hairs disappeared in 1995. O'Hair made every possible error of judgment during this case and the only winners were the lawyers.

By the early 1990s it was apparent that American Atheists was in serious trouble. In October 1991 O'Hair had a serious heart attack; she never recovered her former health and vitality. Her weakened condition exacerbated growing tensions and quarrels. This was brought to a head early in 1992, when O'Hair dissolved the regional chapters and centralized the organization. The main reasons for this were chronic infighting in the chapters and their tendency to challenge O'Hair's primacy. Problems also grew for *American Atheist* magazine,

which had improved considerably between 1988 and 1992. Under growing financial and health pressures, the journal staggered and in 1992 collapsed. It was replaced by an expanded newsletter.

By the time Madalyn, Jon Garth, and Robin Murray-O'Hair disappeared in September 1995, the organization was in severe difficulty. Not least of its woes was the ever-dwindling number and quality of people prepared to work for it. Everyone else had left, bitterly estranged by the time David Waters, a career criminal with convictions for a range of brutal crimes, was employed as typesetter and office manager. It was Waters, along with two accomplices, who bore responsibility for the abduction and murder of the O'Hairs. The most likely date of their death is September 29, 1995, although it is possible that Robin died four days previously.

Madalyn Murray O'Hair's legacy is mixed. *American Atheist* had its ups and downs, but in its day was a good magazine. One strength was its historical awareness, particularly with respect to freethought history. But such an orientation serves to give a journal a backward-looking emphasis, which contributes in turn to the generally hostile and uncomprehending attitude to the world as it actually is. Less successful were the books American Atheists chose to publish, which pursued eccentric theses or were poorly written. More valuable were the pamphlets, which were concise and well designed for their target market.

O'Hair made three great contributions to the progress of atheism: two of them marked by what she did, the other by what she didn't do. The first of the positive contributions was the *Murray v. Curlett* case, which helped change cultural conditions in America forever. The second positive contribution was to advance the cause of atheism in a way nonspecialists could appreciate. For all the valid criticisms made of American Atheists during her lifetime, that organization was a refuge for many people who had seen the discriminatory side of religion and who wanted a full-bodied rejection of religion. O'Hair was one of the greatest promoters of popular atheism since Joseph McCabe and Chapman Cohen.

O'Hair's other major contribution was in what she didn't do. At no time did she give any comfort to the fundamentalists who sought to portray atheism or HUMANISM as a religion. If O'Hair's rejection of religion was often unhelpfully expressed and easily used by opponents to portray atheism as extreme negativity, it never fell into the trap of painting atheism as a "me too" substitute to religion.

Balanced against these positive contributions are the negatives. O'Hair's legendary vulgarity served only to confirm the prejudices of those who would equate atheism with a breakdown in morality. It also drove away many who might otherwise have been worthwhile allies. Her high media profile was as much due her ability to single-handedly damage the atheist position as to any recognition of her eminence. More damaging still was her destructive bunker mentality, which also served to alienate friends and strengthen enemies.

These personal flaws may well have been surmountable, but they were exacerbated by intellectual flaws of similar magnitude. The greatest of these was in not seeing the intellectual limitations of atheism. Atheism is not enough of a foundation on which a viable nonreligious system can be built. Atheism states only what one does not believe in; the next step is to move forward and determine what one does believe in. Exploring the realms of NATURALISM and humanism are essential to giving atheism a positive orientation. Organizations united only by what they hate or fear rarely prosper long without feuding and dissension. But more important than mere organizational tension, such an approach misunderstands and fatally undersells humanism as a viable way of living without religion. Humanism is much more than mere rejection of religion, and here Madalyn Murray O'Hair made no positive contribution whatever.

O'HAIR, ROBIN MURRAY. See **O'HAIR, MADALYN MURRAY.**

ORWELL, GEORGE (ERIC ARTHUR BLAIR; 1903–1950), English author. Eric Arthur Blair, who later adopted the pseudonym "George Orwell," was born in India as the son of a civil servant. In 1904 his mother took him and his sister to England for their education. He later described his childhood loneliness and said he felt "isolated and undervalued." The misery of his life in preparatory school is described in "Such, Such Were the Joys" (1953), which was so scathing it could not be published even overseas until after his death. Young Eric qualified as a King's Scholar at Eton, but seems to have done little during the next four years except to read whatever he pleased. He did not apply for university, but in 1922 went to Burma to join the Indian Imperial Police. In his introduction to the French edition of *Down and Out in Paris and London* (1935), he describes himself as "totally unsuited" for police work. In that same introduction, he makes the point, so important for interpretation

of his whole work, that although his theme, the misery of the human condition, is unpleasant, and although he writes directly and honestly, it does not follow that his memories of his own life are necessarily unpleasant. He seems to have found his place as a writer early in life, and although commercial success was slow in coming, there is every indication that he relished his life as a writer.

In England on leave in 1928, he resigned to devote himself to writing, a career he pursued with mixed success to the end of his life. Orwell's works include novels, documentary books, journalism, and poetry, but he is today most widely known for the concepts presented in *Animal Farm* (1945) and in *Nineteen Eighty-Four* (1949), specifically the way that language can and has been used to control thought, a process Walter Lippmann had earlier called the "manufacture of consent" and that has since become universally known as Orwellian abuse of language, through such techniques as insisting on the use of Newspeak as opposed to the ordinary traditional speech and engaging in doublethink, the ability to maintain contradictory ideas simultaneously.

Nineteen Eighty-Four is a warning, if not a prediction, with regard to the future, but it is also a satire on the England of the year it was finished—1948—with the last two digits reversed, as is documented in W. J. West's *The Larger Evils.* It also reflects Orwell's concern for the disregard for objective truth going back at least to his experiences in the Spanish Civil War.

Orwell's View of Religion. Orwell wrote a good deal about religion, but his remarks are scattered about in his writings. More importantly, almost all his work bears on aspects of the human condition that must be of concern to anyone interested in religion and the critique of religion. The state of the church as portrayed in *A Clergyman's Daughter* (1935) and the state of the poor as presented in *Down and Out in Paris and London* (1933) and in *The Road to Wigan Pier* (1937) are essential background to any theology or antitheology.

Orwell was an atheist (see ATHEISM), but because of his knowledge of, sympathy for, and fairness toward the religion of his native England, some commentators have presented him as at least a partial believer. A more accurate view is that Orwell was a tough-minded atheist who saw the difficulty inherent in all positions on the religious question and who had a profound understanding of what it is about human life that has made traditional religion so appealing to so many for so long.

Proof of Orwell's Atheism. According to biographer Bernard Crick, Orwell was "a clear Humanist, even a Rationalist with a pronounced anti-Catholicism, even though one with an ironic attachment to the liturgy, the humane political compromises and the traditions of the Church of England" (see HUMANISM; RATIONALISM; ANTICLERICALISM). The depth of Orwell's atheism is evidenced by his remark to David Astor that anyone who claimed to believe in life after death was being dishonest. Orwell was assigned to write the 1947 volume *The English People* in the popular *Britain in Pictures* series. He began the second chapter by pointing out that since about 1800, religion for almost all of the English people had been little more than the formalities of marriage and burial and acceptance of an ethic of loving one's neighbor, all of which applied to him personally. He went on to say English people "do not know the Bible stories even as *stories.*"

His "Religious" Belief. Orwell referred to an *unspoken* doctrine of the church, which he said was held by the bulk of the common people and by himself, but not by the upper classes. That doctrine is that might is not necessarily right. "If there is hope, it lies with the proles," he wrote in *Nineteen Eighty-Four.* The proles are "uneducated" and so they still assume that truth is one thing and what is said by those in power is another. The modern, educated classes know otherwise. Fear of punishment after death sustained this belief in objective reality in the past, but the great problem of the modern world is that we have lost that hope and that fear. As Orwell wrote in 1944, "Life on earth, as [our ancestors] saw it, was simply a short period of preparation for an infinitely more important life beyond the grave. But that notion has disappeared, or is disappearing, and the consequences have not really been faced." These are the opinions of a thoughtful atheist, nothing more.

The Modern Quandary. Orwell's view of the impossible situation of humanity in modern times is best illustrated in chapter 5 of *Keep the Aspidistra Flying* (1936). There, a character describes our situation as rather like that of Buridan's donkey, except that there are three alternatives: socialism (see SOCIALISM AND UNBELIEF), suicide, and the Catholic Church. More generally, the "Catholic Church" stands for traditional religion. Modern people who are serious and take the doctrines literally, as intended, understand those doctrines are factually false, but this is not to say that they would not be effective for the good of society if we were able to believe them. The problems with socialism are illustrated in *Animal Farm* and are argued at length in many of Orwell's essays. Orwell found all substitutes for religion unsatisfactory. What he discovered in Spain during the civil war and in his wartime work for the BBC was that the defense of democracy against totalitarianism may require resort to techniques of thought control that end up undermining democracy. So without hope of divine intervention there is no hope at all, except perhaps with the proles. The third alternative, suicide, correlates with the "nihilistic quietism" Orwell attributed to Henry Miller. Here again he shows nuanced feelings of attraction and repulsion. Orwell eventually considered a fourth alternative, the reconstruction of Christian doctrine as being true in some sense, but not literally so. Here his criticism is almost unmitigated.

DAVID WHITE

OUIDA (MARIE LOUISE DE LA RAMÉE; 1839–1908), English novelist and long-closeted freethinker. Ouida was born Louise Ramé at Bury St. Edmunds, Suffolk, England, to a middle-class Englishwoman and a French rake. Before he vanished Louis Ramé managed to give young Ouida (as she childishly mispronounced "Louise") an above-average education, also filling her head with romantic notions of intrigue and elite culture. In time he stole to Paris to vanish during the 1871 Commune. By then, Ouida—now her chosen pseudonym—was a household name.

At eighteen, Ouida had persuaded her mother and grandmother to move to London so she could become a novelist. In short order she sold a story to W. Harrison Ainsworth, editor of a popular literary review. He would publish eighteen more in the next three years. Ouida's characters were larger than life, her plots melodramatic, her stories "naughty" but free of Victorian moralizing. She became a sensation; at age twenty-six her novels sold as briskly as those of Charles Dickens. Some theorized she was actually George ELIOT. Her *Strathmore* (1865), *Chandos* (1866), and *Under Two Flags* (1867) were hugely successful; in the lattermost, Ouida invented the troubled character who joins the Foreign Legion in order to forget. Unsurprisingly, Edward George Bulwer-Lytton praised her work; but so did Henry James. As late as 1891, freethought orator Robert Green INGERSOLL told the Chicago *Inter-Ocean* that "Ouida is probably the greatest living novelist, man or woman." She is best known today for her 1872 children's story, the oft-filmed *A Dog of Flanders.*

Ouida moved to Europe and lived beyond her eventually dwindling means. Alternately she fled from creditors (sometimes accompanied by as many as thirty dogs) and campaigned for animal rights, helping to found the Italian Society or Prevention of Cruelty to Animals. She died in poverty in Italy.

Ouida's fiction dealt but little with religion; she revealed freethought views in an 1895 nonfiction book, *Views and Opinions.* Her essay titled "The Failure of Christianity" demonstrated an understanding that all religions, Christianity included, are human inventions; she accused Christianity in particular of moral hypocrisy and of fomenting the very hostilities that its ethic of love claims to prevent. The essay had some minor impact in view of Ouida's prior fame; it was cited approvingly by anarchist Emma Goldman (see ANARCHISM AND UNBELIEF) as late as 1917.

TOM FLYNN

OWEN, ROBERT (1771–1858), British industrialist, philanthropist, polemicist, and social reformer. Robert Owen is primarily remembered as a crusader for communitarian socialism, early childhood education, and the cooperative movement. Most of his life was dedicated to attempts to improve the working conditions, education, and environment of impoverished factory workers and the development of cooperative utopian communities. Convinced that character was the product of the interaction between human nature and the environment, Owen argued that education was the key to improving human society. Education would lead to a universal revolution in human thought and behavior that would replace irrationality with rationality. Owen presented his vision of a new rational society with the certainty of a prophet in his many lectures, debates, pamphlets, journals, and books. His ideas and goals, however, were regarded with suspicion among his more conservative peers because of his outspoken criticism of capitalism and traditional religious beliefs.

Challenging prevailing social and religious doctrines, Owen publicly admitted that he believed all religions contained gross errors that caused human beings to become bigots, fanatics, and hypocrites. In particular, Owen thought that the religious doctrines held by his contemporaries were detrimental to the advance and implementation of social reform. Critical of many

aspects of religion and capitalism, Owen predicted the eventual emergence of a "new moral world." Marxist critics such as Friedrich Engels called him a "utopian socialist," while even his admirers considered him rather naive and overly optimistic in his assessment of human nature.

Early Life and Career. Owen was born on May 14, 1771, in Newtown, a small town in North Wales, to Anne Williams Owen, the daughter of a farmer, and Robert Owen, an ironmonger and saddler. Although Owen was an excellent student and remained a prodigious reader throughout his life, his formal education ended when he was nine. After serving as an apprentice in a draper's shop in Manchester, he established a firm that manufactured cotton-spinning machinery and became manager and part owner of several different cotton mills. During this period, Owen became a member of the Manchester Literary and Philosophical Society and a member of the Manchester Board of Health.

In 1799 Owen and his partners purchased David Dale's cotton mills in New Lanark, Scotland. That same year, Owen married Dale's daughter, Anne Caroline Dale, and became a member of one of England's leading industrial families. Dale's factories employed more than one thousand men, women, and children. While continuing to make respectable profits, Owen instituted a series of programs that improved living and working conditions for all workers, establishing schools and stores, and refusing to hire children under the age of ten.

Although the New Lanark mills continued to provide respectable profits, Owen's partners objected to his expanding reform efforts, forcing him to enlist more enlightened individuals to buy out his original partners. Convinced that industrialists would not voluntarily support labor reforms, Owen campaigned for laws that would protect workers. Parliament passed a Factory Act in 1819, but it was far weaker than the legislation Owen had proposed.

By 1816, having accumulated a considerable fortune, Owen was able to relinquish routine management of the mills and devote himself to pursuing his social and educational theories. Owen disseminated his ideas through lectures, publications, and the creation of organizations such as the Institute for the Formation of Character and the Home Colonization Society.

Communitarian Villages. To create a better society and solve the social and economic problems of workers, Owen suggested the establishment of self-sustaining cooperative villages. Communitarian villages would offer decent housing, communal kitchens, nurseries, and schools, as well as farm and factory work. Unfortunately, the model villages inspired by Owen's theories were generally short-lived.

Hoping to find a more receptive environment in America, Owen purchased land in Indiana. His New Harmony venture consumed much of Owen's wealth, but his plans for a new utopia were thwarted by disagreements about property rights and opposition to his outspoken views on religion. Leaving New Harmony to his sons, William and Robert Dale Owen, he returned to London, where he devoted himself to publicizing his causes in a series of generally short-lived newspapers, including the *Crisis*, the *Rational Quarterly*, and the *Millennial Gazette*. In 1832 he announced the establishment of a "labor exchange" in London. Although this venture was unsuccessful, the concept of allowing workers to exchange "labor notes" for consumer goods provided a model for consumer cooperatives and labor exchanges. In 1858 Owen published his autobiography, *The Life of Robert Owen, Written by Himself*. He died on November 17 in the same year, in Newtown, the town of his birth, and was buried next to his parents.

LOIS N. MAGNER

OWEN, ROBERT DALE (1801–1877), American writer, educator, reformer, legislator, diplomat, and statesman. Although Robert Dale Owen held beliefs that many of his contemporaries regarded as radical, he became a respected member of the Indiana General Assembly and the US House of Representatives. Owen supported progressive social legislation and was instrumental in the establishment of the Smithsonian Institution. Considered an advocate of FREETHOUGHT, Owen campaigned for causes ranging from the abolition of slavery to birth control, rights for women and workers, free public schools, and better roads. Owen's writings included books and

pamphlets on architecture, education, birth control, theology, and spiritualism.

Early Life. Robert Dale Owen, the eldest son of the British industrialist and social reformer Robert OWEN and Caroline Dale Owen, was born in Glasgow, Scotland, on November 7, 1801. Young Robert and his siblings absorbed the traditional religious beliefs of their mother, but their father introduced them to the world of skepticism, freethought, and comparative theology. Robert was educated at his father's model school in New Lanark and Emmanuel von Fellenberg's progressive school in Switzerland. Returning to New Lanark in 1823, he assumed much of the burden of managing the family's factories and supervising the school.

In 1825 the elder Robert Owen purchased property in Indiana in order to establish a communitarian village called New Harmony. Two years later, discouraged by the apparent failure of his Indiana venture, Robert Owen returned to England. Robert Dale Owen and four of his siblings remained in New Harmony and became distinguished American reformers, scientists, and educators. As editor of the *New Harmony Gazette*, Owen became closely associated with the abolitionist, feminist, social reformer, and atheist Frances WRIGHT. Owen accompanied Wright on a trip to her experimental community at Nashoba, Tennessee; Europe; and New York, where Owen became editor of the freethought journal the *Free Enquirer*.

Perhaps the most controversial work that Owen undertook was the publication of *Moral Physiology: or A Brief and Plain Treatise on the Population Question* (1830), the first American book to advocate birth control (see BIRTH CONTROL AND UNBELIEF). Although clergymen condemned Owen's book, it went through many editions and sold more than seventy-five thousand copies before Owen's death in 1877. Owen argued that women should not be burdened with ignorance and unwanted pregnancies. By recommending coitus interruptus (also known as onanism), however, he placed the burden for limiting pregnancies on men. According to Owen, French physicians had told him that this method was widely and successfully used in France. Owen discussed the barrier sponge method and partial withdrawal, which had been recommended by Richard CARLILE in *Every Woman's Book: or, What Is Love?* (1826), but dismissed these methods as ineffective. The adoption of birth control, Owen believed, was part of the inevitable progress of human improvement. In 1832 Charles KNOWLTON, an American physician, published a similar book, *The Fruits of Philosophy: or The Private Companion of Young Married People*, which was famously denounced as an "indecent, lewd, filthy, bawdy, and obscene book."

Marriage Protest and Political Career. On April 12, 1832, Owen married Mary Jane Robinson in a simple ceremony performed by a notary public. The Owens explained that their decision to contract a legal marriage was not because they thought marriage necessary or useful, but because they did not want to be subjected to the petty "annoyances" that would occur if they simply became companions. Owen and his wife signed a declaration in which Owen forfeited the unfair rights granted to husbands over wives by law and religious dogma. Although Owen acknowledged that their declaration was not legally binding, he publicly declared that he considered himself "utterly divested" of the unjust rights that were "the barbarous relics of a feudal, despotic system." The newlyweds then visited England, where Owen helped his father edit the *Crisis* and organize a labor exchange in London before the couple returned to settle in New Harmony.

On returning to Indiana, the former radical successfully confronted the need to support his own family through farming and land speculation. Owen became interested in politics, actively pursued public office, and focused his reform activities on education, the abolition of slavery, and women's rights. In 1838 he was elected to the first of three terms in the Indiana General Assembly. Before becoming a candidate for the US House of Representatives, Owen acknowledged that his youthful enthusiasm had led him to support causes that might seem radical, but he argued that these activities had provided a foundation for his commitment to pragmatic social reforms. This concession might have caused Owen's estrangement from former associates in the freethought movement. Conservative critics, however, continued to view Owen as a radical. For example, when Owen was invited by the Union Literary Society of Hanover College to deliver an address, the president of the college and some of the trustees refused to allow an "infidel" to speak on campus.

After two unsuccessful campaigns, Owen was elected to his first term in the House of Representatives, where he served from 1843 to 1847. As a member of Congress, he introduced the bill that established the Smithsonian Institution. Owen's attempt to win a third term in Congress was unsuccessful. In 1850 Owen was elected to Indiana's Constitutional Convention, where he was instrumental in securing property rights for widows and married women, tax support for public schools, and the reform of divorce laws.

To reward Owen's party loyalty, President Franklin Pierce appointed him charge d'affairs and resident minister to Italy, where he served from 1853 to 1858. On his return to the United States, Owen became an outspoken opponent of slavery, authoring *The Policy of Emancipation* (1863) and *The Wrong of Slavery* (1864). On September 17, 1862, Owen wrote a letter to President Abraham Lincoln urging him to issue a proclamation emancipating the slaves. Owen argued that the nation could never enjoy peace and prosperity if the "blighting curse" of slavery continued to exist. Lincoln said that Owen's letter struck him "like a trumpet call." Five days later, Lincoln issued the Emancipation Proclamation.

Spiritualism. Historians called Owen a radical who

believed in the inevitability of progress and a skeptical attitude toward ancient dogmas. Contemporaries, however, were struck by the fact that he began his public life as an "infidel" and ended his career as a believer in spiritualism (see SPIRITUALISM AND UNBELIEF). Owen's conversion to spiritualism became widely known in 1859 when he published *Footfalls on the Boundary of Another World*. In 1871, after the death of his first wife, Owen published *The Debatable Land between This World and the Next*. These books were highly regarded by members of the spiritualist community, but condemned by American freethinkers and evangelical Christians. In 1876 Owen married Lottie Walton Kellogg. He devoted his last years to writing about social problems and an autobiography, *Threading My Way* (1874). On June 24, 1877, he died at his summer cottage on Lake George, New York.

LOIS N. MAGNER

PAINE, THOMAS (1737–1809), American author, revolutionary, freethinker, and reformer. Thomas Paine's life as archetype and the works of his pen as ideology continue to inspire and animate almost every social and political movement for equal rights, democracy, and liberty of conscience. The history of unbelief would be incomplete without reference to Paine's *Age of Reason*, an analysis and critique of the Bible and superstition, and the greatest attack on established religion and Christian doctrine ever written. No other figure from the late eighteenth century exerted a greater continued influence upon leaders and movements for reform, FREETHOUGHT, and democracy than Thomas Paine.

Early Life. Paine was born in Thetford, England, on January 29, 1737. His father, Joseph Paine, was a Quaker and his mother, Frances Cocke, a member of the Church of England. Paine's childhood in a mixed-religion household doubtless provided the foundation for his at once unorthodox and tolerant views on religion. He followed his father's trade and became a staymaker, but Paine was always yearning for something more than manual labor. He left home at sixteen years and later, "heated with the false heroism" of an admired schoolmaster, joined the crew of the privateer *Terrible*, whose skipper sported the audacious moniker Captain William Death. Paine's affection and admiration for his father may be felt in his recollection that "[f]rom this adventure I was happily prevented by the affectionate and moral remonstrance of a good father who, from his own habits of life, being of the Quaker profession, must have begun to look upon me as lost." The *Terrible* lost 90 percent of its crew, including Captain Death. The impression left by his father's remonstrance and the fate of the *Terrible* must have suffered the short half-life of youth, because the following year Paine went to sea on the *King of Prussia*. The voyage was successful and Paine received for his portion of the prize what seemed a handsome sum to a young man of humble means.

Paine stayed in London about a year subsequent to his return from sea. As Paine recounted, "[T]he natural bent of my mind was to science. . . . As soon as I was able I purchased a pair of globes, and attended the philosophical lectures of Martin and Ferguson, and became afterward acquainted with Dr. Bevis, of the society called the Royal Society, then living in the Temple, and an excellent astronomer." Later he moved to Dover, Sandwich, and Margate, where he practiced his father's trade, probably dabbled with Methodism, and married a young woman of whom he became enamored, Mary Lambert. His wife and infant died in childbirth. Historians speculate to what degree his young wife's death affected Paine; he left not a word on the subject.

Paine first gained prominence, ironically enough, while an officer of the Crown in the excise or tax service. His first appointment was in the market town of Alford, center of a region then known for smugglers. Paine was afterward dismissed and rehired in a series of events still debated among historians. Paine's new post was in the village of Lewes, Sussex, where he met and married his second wife, Elizabeth Ollive, in 1771. Here Paine wrote

his first published work, a twenty-one-page request for better pay and working conditions known as *The Case of the Officers of the Excise* (1772). Paine was sacked for his efforts while he lobbied in London, and not long afterward he and Elizabeth agreed to an amicable separation. Paine never remarried, and he was never again credibly linked with another woman in other than a platonic friendship.

The world owes Thomas Paine's epic revolutionary career to Benjamin FRANKLIN. While in London, Paine had a copy of his excise pamphlet delivered to Irish playwright Oliver Goldsmith along with the request of "his company for an hour or two." Goldsmith agreed and the two quickly became friends. Paine arranged an introduction through Goldsmith to Franklin, who would become his lifelong mentor and friend. Franklin encouraged Paine to emigrate to America in 1774. He was thirty-seven years old.

American Works. Franklin's letter of recommendation gained Paine a position as editor of the *Pennsylvania Magazine*, where he improved his already considerable skills in writing and polemic. Unable to resist the climate of change and reform that infused American life, Paine plunged into the issues of the day and launched a career that would make his name renowned.

A good deal of confusion exists concerning the authorship of early essays credited to Paine, thanks to the near-universal reliance on pseudonym in that period. Historian Frank Smith long ago proved that Paine did not write *An Occasional Letter on the Female Sex* (1775), an early plea on behalf of women. Paine gets credit for its publication, but did not author it. The case is somewhat stronger for *African Slavery in America* (1775), but while every biographer and editor since Moncure CONWAY has accepted Paine's authorship, historian Alfred Owen Aldridge believed "there is no good reason" to ascribe the work to Paine. Regardless of the authorship of that essay, Paine was throughout life an outspoken critic of slavery and inhumanity of all forms. While at the *Pennsylvania Magazine*, Paine advanced his lifelong interest in poetry and wrote essays against cruelty to animals, dueling, aristocratic titles, and in support of Quakers who found pacifism inadequate in the face of British attacks.

Thomas Paine's *Common Sense* (1776), caused Joel BARLOW (see TREATY OF TRIPOLI), not John Adams, to write that "the great American cause owed as much to the pen of Paine as to the sword of Washington." From the wealthiest landowner to the humblest shoemaker, colonists were won over to the idea of independence by Paine's pamphlet. Widespread acceptance of its arguments prepared the way for the signing of the Declaration of Independence six months later. So universally acclaimed was his earliest important work that Paine himself was known as "Common Sense" and was so addressed by many throughout his life. Paine appreciated the importance of his seminal work. Thirty-three years later his last wish was that his gravestone simply say, "Thomas Paine—Author of *Common Sense.*"

Paine's first major work united the colonists for independence. His second, a series of essays titled *The American Crisis* (1776–83), preserved Washington's army and inspired the populace in one of the revolution's darkest hours. By December of 1776, defeat, retreat, desertion, and short enlistment expirations had reduced Washington's original army by more than half. They camped half frozen, poorly equipped, sullen, and bloodied while Congress abandoned Philadelphia and patriotic citizens evacuated in droves. Those who had never wholly supported the rebellion infected others with their discontent. The infant republic appeared stillborn, and Washington wondered if he might be hanged, drawn, and quartered for treason. Paine's "These are the times that try men's souls . . ." is a phrase still almost universally invoked in times of great urgency. If *Common Sense* may be said to have inspired the Revolution, *The American Crisis* preserved and sustained it. Washington ordered it read to his troops on Christmas Eve 1776, the night before the colonials' first victory in the Battle of Trenton. Printing presses leaped into action and Paine's fame soared, but this was just the beginning.

Paine's reputation for letters now widespread, the Continental Congress called upon him to serve as the secretary to the Committee for Foreign Affairs. His exposure of an early defense procurement scam caused a scandal and made enemies that would shadow him the rest of his life. Paine went to France with John Laurens in order to secure desperately needed arms, ammunition, and supplies. They returned with funding and equipment that enabled the colonies' first major victory, the Battle of Saratoga. Paine also served for a time as secretary to the Pennsylvania General Assembly, where he had a hand in writing the first law in the world governing the abolition of slavery.

Paine was an inventor who remained deeply interested in the sciences throughout his life. He secured a position in the history of engineering with his invention of the first single-span iron bridge. He also developed a smokeless candle and discussed ideas for a planing machine, steam navigation, a crane, and a theory that gunpowder might serve to drive a motor. The desire to promote his iron bridge took Paine back to England not long after the cessation of revolutionary hostilities.

Return to Britain. While in England, Paine authored *Rights of Man* (1771–92), his two-part reply to Edmund Burke's attack on the French Revolution and still the foundational text on democratic government. He was then fifty-four years of age. The storm of controversy it sparked in England and its subsequent sales were even greater than those of *Common Sense.* Historian John Keane calls it "the best selling book in the history of publishing." Paine's list of enemies within the elite swelled.

During a 1791 visit to Paris, Paine joined Brissot de

Warville, the Marquis de CONDORCET, Etienne Chaviére, and Achille Francois Châtelet to found the Société des republicains, which opposed the restoration of Louis XVI. With Lanthenas and Paine's lifelong friend, publisher Nicolas de Bonneville, he started the journal *Le Républicain.* Paine and Châtelet plastered the streets of Paris with a manifesto against monarchy and in favor of a new French Republic. Said Paine, "[A]gainst the *whole hell* of monarchy . . . I have declared war." When Bonneville was later put under arrest and denied exit from France, Paine sheltered his friend's wife and children in America.

By the time Paine returned to Britain, a political storm had broken out, with his *Rights of Man* at the center of the cyclone. A judicial summons was issued and the jaws of the law closed upon him. Forewarned by William Blake of his imminent arrest and likely execution, Paine rode to Dover, a government spy in close pursuit, and sailed for the French coast.

France. Received as a revolutionary hero in France, Paine was elected to the French Assembly from four *départements*, the French equivalent of states. He coauthored the first French constitution and spoke eloquently against Louis XVI's execution, a performance that enraged the Jacobins and put his life in danger. Paine was trapped. He could return neither to England nor to America without risk of capture and execution.

The guillotine rose and fell with the breath of the doomed as Paine's friends went one by one to the scaffold. Paine expected his own arrest daily. He had already written his political testaments. Now he hoped to live long enough to address the most dangerous and volatile issues of all: theology and established religion. The first part of his *Age of Reason* (1794) was completed six hours before his arrest and passed to Barlow as Paine was led to prison. He wrote the greater portion of the second part in jail, despite grave illness. Saved from the guillotine by a jailer's chalk mark on the wrong side of a door, Paine lived to again attend the French Convention and receive a young admirer, Napoleon, who said he slept with *Rights of Man* under his pillow and that a "statue of gold should be erected to you in every city of the universe."

The Age of Reason was another runaway best-seller in America and Europe. But as its circulation grew, religious fundamentalists reacted with alarm and Paine's political enemies gloated. In perhaps the most successful smear campaign in history, Federalists flogged Paine with his religious views in order to discredit his democratic radicalism, while religious conservatives called down anathema and invective on the great "Agent of Lucifer." Though *Age of Reason* was written to forestall a headlong descent into ATHEISM by the French Revolution, it was called the work of an atheist. Though Paine wrote movingly in praise of the God of Nature (see DEISM), his enemies painted him as a godless man.

Agrarian Justice (1795) is another important contribution to social justice written in this time. Less well known than many of Paine's works, it contains the earliest proposal for a funded social security system. The US Social Security Administration considers it a formative text, and it is posted in the history section of its Web site today.

Last Days in America. Paine returned to America in 1802 when treaties opened a brief window of opportunity to travel without risking arrest. Popular reaction to the Federalist administrations of Washington and Adams had placed Paine's friend Thomas JEFFERSON in the presidency. When Jefferson welcomed Paine to the White House, a firestorm of protest erupted in the Federalist press. Paine was hounded and castigated at least as much as he was honored and feted upon his return. He continued to write essays on religious subjects, many of which appeared in Elihu PALMER's *Prospect* and are generally cataloged as *The Prospect Papers* (1804). Paine also wrote on political and economic subjects, including *Constitutions, Governments, and Charters* (1805), and a a December 25, 1802, letter to Jefferson that may be the earliest proposal for the Louisiana Purchase.

Thomas Paine died peacefully on June 8, 1809. Undiscerning biographers still repeat the slanders published by Paine's enemies, despite the efforts of FREETHOUGHT and reform publisher Gilbert VALE to systematically disprove them in his *Life of Thomas Paine*, written more than 160 years ago. Paine never was the impoverished, broken-down mess that his enemies described after his death. He was a moderate drinker who consumed less than the standard for his day. His estate was valued at twelve thousand dollars at his death, a substantial sum for that period. Paine bequeathed most of it to Madame Bonneville and her children, one of whom became Captain Benjamin Bonneville of western exploratory fame. Paine lived abstemiously in later life, but he was far from impoverished or ungenerous. Nor did he recant his religious views, another fraudulent litany still chanted by religionists today.

In 1839 Vale erected a marble monument over Paine's gravesite in New Rochelle, New York. The grave itself had been robbed of its contents in 1819 by William Cobbett, who took the bones back to England, where they subsequently disappeared after Cobbett's death.

Paine's Legacy. Thomas Paine lives on through his life and works. Paine has been admired and invoked by individuals as diverse as Ronald Reagan, Emma GOLDMAN, Walt WHITMAN, Barry Goldwater, Thomas Edison, and Abraham Lincoln. All of Paine's major writings and many lesser-known works are still in print. His ideas are discussed in schools and universities, historical societies, political parties, freethought associations, and even in churches. His works formed the nexus around which the struggle for press freedom was waged in Great Britain. Paine's early practical proposal for arms reduction and a League of Nations is a dream still in progress at the United Nations.

The history of unbelief is inextricably intertwined with Thomas Paine and his *Age of Reason*, the foundation text of American and British SECULARISM. Thomas Paine birthday celebrations, first held in 1818 in England

and 1825 in the United States, are occasions when the leaders of freethought, equal rights, labor, secularism, and cooperation may meet, recharge their enthusiasm, and organize around the words and life of the "father of modern reform," Thomas Paine.

KENNETH W. BURCHELL

PALMER, ELIHU (1764–1806), American freethinker and militant deist. Elihu Palmer, who began his public life in 1787 as a Presbyterian minister in what is now the New York City borough of Queens, metamorphosed into one of the most radical freethinkers in the young American republic. A local historian with whom Palmer apparently stayed while recovering from a smallpox inoculation witnessed the early stages of the minister's transformation. One evening Palmer's host overheard him reciting a well-known couplet embodying Calvinist orthodoxy: "Lord, I am vile, conceived in sin,/And born unholy and unclean." Palmer turned to another guest and declared that he did not believe a word of this sentiment. The guest advised him to be cautious about such remarks, given that they would not sit well with local parishioners.

The warning proved prophetic; Palmer was dismissed from his pulpit less than a year later, moved to Philadelphia, and joined the more liberal Baptist Church in 1789. The Baptists dismissed him, too, and Palmer then announced his allegiance to the new Universalist Church and his rejection of the divinity of Christ (see UNIVERSALISM TO 1961). There was only one problem: Universalists believed in the divinity of Jesus, and Palmer and his small group of followers were soon banned in Philadelphia. Palmer then placed an advertisement in a local publication of his intention to preach a sermon challenging the divinity of Jesus. His biographer later reported that "the society of Universalists were in an uproar; and being joined by people of other denominations, instigated probably by their priests, an immense mob assembled at an early hour before the Universalist Church, which Palmer was unable to enter. In fact, it is stated, he was in personal danger, and was induced to quite [quit] the city, somewhat in the stile of the ancient apostles on similar occasions."

Deciding that his prospects in any ministry were nil, Palmer took up the study of law and passed the bar in 1793. A few months later, the nation's first epidemic of yellow fever took more than five thousand lives in Philadelphia. Palmer's wife was among the dead, and although he survived, his sight was destroyed. His enemies saw his blindness as God's punishment for heresy, notwithstanding the thousands of fresh graves housing the corpses of pious Christian believers.

Since blindness had put an end to his prospects as a lawyer, Palmer then took to the road as an itinerant lecturer on deism. His first stop was Augusta, Georgia—Georgia had modeled its law separating church and state on Virginia's pioneer 1784 statute establishing religious freedom—where he delivered a series of lectures from the steps of the courthouse. In contrast to his treatment in Philadelphia, Palmer's reception in Georgia reflected a religious liberalism that still prevailed in a region where Thomas JEFFERSON and James MADISON were revered. Then Palmer swung north to New York City, where he received a decidedly cooler reception when he attacked the doctrine of the Virgin Birth on Christmas Day. He even delivered a scathing attack on Christianity's most sacred doctrine—the redemption of man by Christ's death on the cross.

For all his abrasiveness, Elihu Palmer is an important figure in the history of American SECULARISM because, like the much better known Thomas PAINE, he attempted to carry the message of DEISM beyond its original audience of educated upper-class intelllectuals. Between 1804 and his death in 1806, Palmer published two deist newspapers in New York—the *Temple of Reason* and *Prospect, or View of the Moral World.* He organized deist societies in New York City; Newburgh, New York; Philadelphia; and Baltimore; their membership was drawn not from prominent citizens but from artisans and shopkeepers.

Palmer's only full-length book, his 1801 *Principles of Nature; or, a Development of the Moral Causes of Happiness and Misery among the Human Species*, sold out three editions before 1806. In Palmer's view, all nonreligious advances in human thought began with the invention of the printing press and proceeded toward the day when philosophical assaults on church and state despotism produced both the American and French revolutions. "This philosophy," he declared, "has already destroyed innumerable errors; it has disclosed all the fundamental principles which have been employed in the construction of machines, mathematical instruments,

and the arrangements of those moral and political systems which have softened the savage and ferocious heart of man, and raised the ignorant slave from the dust, into the elevated character of an enlightened citizen."

Elihu Palmer died destitute in 1806. His widow (he had remarried after his first wife died of yellow fever) was supported by Thomas Paine, a man of great personal charity in spite of his own reduced financial circumstances.

SUSAN JACOBY

PARANORMAL, BELIEF IN THE. Though there are many definitions of *paranormal* (literally, *para-* "beyond" the normal), the term often refers to phenomena or events that seem to defy naturalistic explanations. Typical paranormal topics include astrology, psychic powers, UFOs, fortune telling, homeopathy, ghosts, and auras. Strictly speaking, a paranormal event is not simply one beyond the ordinary, since remarkable, odd, and unusual occurrences happen all the time. (As one statistician noted, in a country with three hundred million people, a one-in-a-million chance happens three hundred times a day.) Nor is a paranormal phenomenon merely one for which there is no ready explanation at hand, since *unknown* is not the same as *unknowable*. Information unknown one day may be common knowledge the next; diseases once thought to be caused by curses are now known to be the result of germs and genes.

Belief lies at the core of the paranormal, since truly paranormal events, like supernatural beings, have never been proven to exist. Evidence, on the other hand, lies at the core of science. Botanists are not asked if they "believe in" photosynthesis, and physicists are not asked if they "believe in" gravity. Yet skeptics are often asked if they "believe in" astrology or phrenology, and atheists or agnostics may be asked if they believe in God. For skeptics, as for unbelievers, the issue is not belief but evidence.

Belief in the paranormal is widespread; surveys show consistently that significant numbers of Americans believe in ghosts, psychic powers, astrology, UFOs as extraterrestrial spacecraft, and so on. Expanding the definition of *paranormal* to include belief in God moves that number into the majority. Many paranormal claims touch upon issues of religion and unbelief; those interested in atheism, humanism, and unbelief will find much in common with those skeptical of the supernatural and the paranormal.

Philosopher Paul Kurtz has discussed a "transcendental temptation," the tendency in human nature to accept a paranormal or occult universe. The inherent human desire to look outside ourselves for meaning leads some to religion, some to paranormal belief, and many to both. Unbelief can be viewed as the logical conclusion of skepticism, and surveys of top scientists have found that a vast majority of them hold no religious belief. While many skeptics are humanists or unbelievers, others quite comfortably hold beliefs in deities and find no contradiction between these beliefs and their skepticism.

Paranormal and Religious Belief. Nearly all religions are based on a belief in paranormal gods or a single god (see RELIGION). Lesser paranormal entities (such as angels, demons, djinn, etc.) may also be invoked as messengers or agents of the supernatural deities. Many religions have miracles and paranormal beliefs unique to them. Christianity, for example, has an entire subset of explicitly Catholic paranormal claims, such as Marian apparitions, simulacra (appearance of holy personages in random patterns such as stains on cloth, in windows, clouds, etc.), and miraculous statues that bleed or weep (see MIRACULOUS PHENOMENA). These are often the result of proven fraud or perceptual errors, such as pareidolia (in which the mind creates specific images in response to ambiguous stimuli).

Those who claim to miraculously bear the wounds of Jesus are referred to as suffering from stigmata. Stigmatics will sometimes exhibit blood on their hands and feet, as well as on their side (as from a spear wound) and head (as from a crown of thorns). Stigmata appear only among devout Catholics, and the wounds are such that fraud and trickery cannot be ruled out. Many cases of religious-paranormal hoaxing are committed not for financial or personal gain, but instead to draw adherents and reinforce faith among believers.

Exorcism and demonic possession are also explicitly religious paranormal phenomena. The Bible cites several examples of Jesus exorcising demons (e.g., Matt. 17:18, Luke 9:42, Luke 11:1), though exorcisms have become somewhat secularized by mass-market pop-culture treatments (films and books such as *The Exorcist* and *The Amityville Horror*, for example).

Because both religion and the paranormal presume the supernatural, adherents share many common attributes. Indeed, the line between religion and the paranormal can be porous. Many cults combine Christian endtimes prophecy with belief in extraterrestrial aliens and UFOs. The most famous example in recent years was the Heaven's Gate cult, whose leaders believed they were special messengers from God. The group, thirty-nine of whose members committed suicide in 1997, believed that the comet Hale-Bopp was a sign to exit the earth for their heavenly rewards.

Like religion, the paranormal often separates believers from nonbelievers. Though believers claim plentiful evi-

dence for their ideas, most also recognize that the issues fundamentally rest on faith. Thus the question "Do you believe in UFOs?" (or Bigfoot, or psychics) is parallel to "Do you believe in Catholicism?" Skeptics and unbelievers, in contrast, distinguish themselves by questioning the very premises of belief. A platitude often heard in paranormal circles is that "for those who don't believe, no evidence will suffice. For those who believe, no evidence is necessary."

Though there is some debate about the appropriate breadth of scientific and skeptical inquiry regarding religion, traditionally the skeptical movement has restricted itself to examining testable claims. For example, the issue of whether humans have souls is not a testable (or falsifiable) question (see FALSIFIABILITY), though a claim that the soul can be measured is appropriate and verifiable through scientific inquiry. (At one point the weight of the human soul was believed to be twenty-one grams, the amount of weight a body lost at death as mismeasured by a doctor.) Similarly, a stigmatic either does or does not have actual wounds that open up spontaneously and miraculously; a clairvoyant or dowser either can or cannot perform feats under controlled conditions. Other paranormal religious claims said to have been validated by science include creationism, the existence and location of Noah's Ark (see NOAH'S FLOOD AND UNBELIEF), and faith healing.

Whether the issue is unseen ghosts, unseen aliens, or unseen deities, the underlying question in both paranormal and religious claims is why people believe as they do. Belief in the paranormal is in this respect a psychological issue at its core. The human mind is designed to seek patterns, and is so successful that it often sees patterns where none exist. Thus gamblers may believe they are on a lucky streak when in fact random chance has just caught up with them, or a devout pilgrim may see a "miraculous" religious image in tree bark or a coffee stain. Neither belief is inherently silly—instead, both result from natural and common human errors in thinking.

Paranormal Belief through the Ages. Belief in the paranormal has apparently remained a constant in human history. Early societies held animistic beliefs, imbuing natural objects such as trees, water, and earth with spirits that could be petitioned or controlled through rituals. Stories of miracles and monsters date to before biblical times. As the Enlightenment flourished and science provided naturalistic explanations for previously mysterious phenomena, the paranormal took on new forms. Paranormal ideas mutate and are periodically repackaged and translated into a new context for each new generation. Bigfoot and the Loch Ness monster have replaced unicorns and mermaids; claims of talking to the dead have replaced claims of raising them.

For example, many trace the modern UFO or flying saucer era back to 1947, but fanciful stories of crashed spacecraft and their dead alien occupants date back to the late nineteenth century and earlier, when such ideas were expressed in fiction before being adapted to the modern UFO lore. Even a phenomenon as apparently timeless as communicating with the dead has changed dramatically over the past century. As longtime paranormal investigator Joe Nickell has pointed out, messages from beyond the grave were florid and profuse at the turn of the twentieth century, yet "[b]y contrast, today's spirits—whom [modern] mediums supposedly contact—seem to have poor memories and difficulty communicating. . . . Gone is the clear-speaking eloquence of yore; the dead now seem to mumble."

Strictly speaking, the paranormal involves supernatural or magical elements, powers, or deities. Magical thinking and superstition are common to both religious belief and the paranormal. Unseen and unknowable forces more powerful than ourselves are believed to influence our lives, whether through astrology, divine intervention, psychic powers, the spirit world, and so on. These forces suggest a personal involvement with the supernatural. Instead of an impersonal God uninterested in human lives and affairs, deities offer paternalistic, individualized attention. Similarly, witnesses to supposedly paranormal events often speak of having been specially chosen to receive the experiences. Thus ghosts and aliens, for example, are seen as messengers from beyond the grave or beyond the stars, imparting personally relevant warnings and wisdom.

Both paranormal and religious belief systems contain an underlying (and often implicit) dissatisfaction with humanity and its potential. We are not happy with ourselves or our abilities, and so we seek soothsayers in robes or collars to reassure us of the future and impart the specialized wisdom they claim to access. Astrologers and psychics hold the same relation to the unseen world as priests and rabbis do.

The paranormal, like religion, often elevates certain people above others. It suggests that a select few have access to special abilities and powers. The paranormal field teems with authors, gurus, self-appointed experts, and spirit guides who claim to have esoteric connections and powers others don't. A fundamental tenet of skepticism and unbelief, in contrast, is that we are all the same deep down: no one has magical psychic powers or divination tools unavailable to the rest of us; none of us is any "better" than other people, except in how we conduct and improve ourselves.

Skepticism, like unbelief, suggests that the answers to our problems and questions lie not in the stars, nor in mystical books or unseen gods, but in ourselves. It is our very human capacities that unite us; skepticism shows us that we should measure ourselves against our fallible, uniquely human qualities, not our wishful notions of mystical powers.

Recognizing and Avoiding Paranormal Beliefs. Like any belief based upon insufficient evidence, paranormal beliefs can be dangerous, especially when they influence important life decisions. People who believe that their bad luck is caused by a curse or black magic sometimes take

lethal revenge on the person they believe cast the curse; disease victims have shunned traditional medical treatment in favor of prayer or unproven "alternative" medicines. The skeptical literature is rife with such examples.

Though perceptual mistakes and the logical pitfalls of magical thinking may be hard-wired in the brain, paranormal beliefs themselves are cultural phenomena, learned by children from their friends and family. Being aware of some of the most common and most important skeptical principles can help weed superstition from the garden of the mind. In his book *The Demon-Haunted World* (1996), Carl Sagan suggested some guidelines for "baloney detection," including requiring independent confirmation of the facts of a case, suggesting more than one hypothesis to explain a given phenomenon, being willing to abandon a hypothesis if it is not useful, ensuring that all links in a chain of argument are valid, and using only hypotheses and propositions that are falsifiable.

Conclusion. It has been said that skeptics take hope away, while the paranormal and religion give hope. After all, there's something wonderful and hopeful about the idea that we all have (or could develop) psychic powers, or that we are being watched by peaceful, all-knowing aliens or gods, or that we will be reunited with long-dead loved ones someday. Most people prefer a world in which coincidences are part of a cosmic plan and not simply random chance, a world in which we are individually chosen instead of "genetic blends with uncertain ends." Yet we cannot bend the world to suit our wishes; we must accept it with all its limitations and randomness and unfairness. And if our self-esteem is not too terribly fragile, we might adopt a measure of humility about our beautiful and ultimately insignificant place in the universe.

BENJAMIN RADFORD

PARIKH, INDUMATI (1918–2004), Indian humanist and reformer. Known as "India's humanist heroine," Indumati Parikh was one of the pillars of Radical Humanist movement in India (see INDIA, UNBELIEF IN). A medical doctor, she devoted herself both to organized humanism and to caring for the downtrodden in the slums of Bombay (now Mumbai), India. She created an organization called Strihitakarini (Helper of Women), which rendered noteworthy service to poor women, particularly the prostitutes of Bombay. She was instrumental in starting the Third World Humanist Center in Bombay, the M. N. Roy Memorial Humanist Development Campus. That facility now houses the headquarters of the Indian Radical Humanist Association, the Indian Renaissance Institute, Strihitakarini, the Center for the Study of Social Change, the monthly publication *Radical Humanist*, and the bimonthly publication *Secularist*. The campus is named for the famed rationalist activist M. N. ROY.

Parikh came into contact with the Indian humanist movement in the early 1930s. Her husband, Professor G. D. Parikh, was rector of Bombay University, a great orator, and a follower of M. N. Roy; she served the humanist cause silently while her husband was alive, devoting herself to her medical work. She recruited her own group of devoted workers who served the needs slum dwellers. Edd Doerr, former president of the AMERICAN HUMANIST ASSOCIATION, said emphatically that her work during this time was far greater than that of Mother Teresa.

After the death of her husband, Parikh took a direct, active role in humanist organizing, injecting new dynamism as she addressed numerous humanist conferences, study camps, and training classes for youth and women. She was twice honored by the INTERNATIONAL HUMANIST AND ETHICAL UNION for her activism.

Among her achievements, she authored articles in English and Marathi on HUMANISM, SECULARISM, and the rights of women. She advocated for population control and women's liberation (see BIRTH CONTROL AND UNBELIEF). She actively participated in India's Renaissance movement, founded by Roy to spread the scientific spirit among the Indian public and recast Indian history from a scientific point of view. She recruited experts to produce scientific studies on the gynecological problems and sexual diseases faced by poor Indian women. She overcame opposition by fundamentalist Hindu groups in Bombay while serving as president of the Radical Humanist Association and building the Humanist Center in India. In addition, she vehemently opposed the nuclear tests conducted by India and warned of the dangers such tests posed for the subcontinent and for world peace. In 1999 she conducted the World Congress of International Humanists in Bombay, where she expressed her concern regarding population growth, and an International Rationalist conference in Trivendrum, Kerala. Devoted to humanism, she continued working for the cause until her death in 2004.

INNAIAH NARISETTI

PASCAL'S WAGER. Pascal's Wager is an argument that claims it would be prudent for those who do not believe that the Christian God exists to do things to try to make themselves believe that proposition. It was expressed by (and named after) the mathematician Blaise Pascal in a collection of notes entitled *Pensées* (Thoughts) published posthumously in 1670. Let us label it PW.

Using GC to mean "the God of Christianity," PW could be formulated in a precise way as follows:

(a) The probability that GC exists is greater than zero.
(b) If GC were to exist, then probably whoever believes that would gain eternal happiness in an afterlife, whereas whoever does not believe that would end up being eternally tormented.
(c) If GC were not to exist, then it would matter very little to people whether or not they believe that GC exists.
(d) Hence, people who do not believe that GC exists are at a great disadvantage. The expected utility of their belief situation is infinitely worse than that of the believers [from (a)–(c)].
(e) But the unbelievers are able to do things to try to make themselves believe that GC exists.
(f) Therefore, it would be prudent for them to try to do those things [from (d) & (e)].

This version of PW comes very close to Pascal's own formulation, though the argument is sometimes expressed in terms of God in general rather than the God of Christianity. (The "general God" version is considered below.) Step (d) makes reference to the concept of expected utility. The expected utility of an action, given two possible outcomes O1 and O2, is the payoff for O1 times the probability of O1 added to the payoff for O2 times the probability of O2. Let us assume that believing is an action and take O1 and O2 as the situations of GC existing and GC not existing. Even if the probability that GC exists is quite small, say, only 1 percent, the expected utility of believing that GC exists would turn out to be infinite because of the infinite positive payoff for such belief. In contrast, the alternate action of not believing that GC exists would have an expected utility of minus infinity. It follows that to be an unbeliever is prudentially irrational.

Objections to PW. 1. Premise (a) can be attacked on the grounds that GC, as described by Christians, has incompatible properties. It would follow that GC's existence has a probability of zero.

2. In addition, there are powerful arguments that the existence of an afterlife, even if it were conceptually possible, is nevertheless shown to be physically impossible by the findings of brain science (see COGNITIVE SCIENCE AND UNBELIEF). Such arguments render moot PW's premise (b), which makes appeal to the concept of an afterlife.

3. Even if an afterlife were possible, the ideas of eternal happiness and eternal torment in an afterlife are incoherent. Happiness and torment are so bound up with earthly bodies and adaptation to the experience (perhaps even eventual boredom) that the idea of them continuing forever apart from earthly bodies is incomprehensible. This is further reason to reject premise (b).

4. According to the Bible, more is required for salvation (eternal happiness) than mere belief that GC exists. One also needs to repent (Luke 13:3), be born again (John 3:3), be born of the water and of the Spirit (John 3:5), believe everything in the gospel (Mark 16:16), eat the flesh of Jesus and drink his blood (John 6:53), be like a child (Mark 10:15), and do good deeds, especially for needy people (Matt. 25:41–46; Rom. 2:5–10; John 5:28–29; James 2:14–26). Other biblical passages (Rom. 8:28–30, 9:18; Eph. 1:4–5, 11; 2 Thess. 2:13; Rev. 13:8, 17:8) support the idea that there is nothing we can do to be saved, since it is all predestined beforehand. Therefore, premise (b) of PW, according to which mere belief that GC exists is probably sufficient for salvation, can be attacked by appeal to the Bible.

5. There are many Christians, such as universalists who believe that eventually everyone will be saved, who would deny PW's premise (b). So the issue of the truth of that premise is far from settled even within Christianity. Furthermore, if the latter part of premise (b) were true, then that in itself could be the basis for a strong argument against the existence of GC. Thus, the given premise is conceptually problematic.

6. There are several reasons to deny PW's premise (c). Most people who believe that GC exists devote significant time to prayer and to church activities. Such people presumably also contribute money, perhaps a tithe (10 percent of their income). In addition, many such people go through life with inhibitions (some of them quite extreme) on both thought and behavior—inhibitions regarding sexual practices, divorce, birth control, abortion, reading material, and association with other people. In some Christian communities, women have historically been oppressed. Some Christians have persecuted and even killed others (as in inquisitions, religious wars, attacks on homosexuals, abortionists, etc.) because they believed this was what GC wanted them to do. Some people, such as members of the clergy, devote their entire lives to GC. For these various reasons as well as others, if GC does not exist, it would indeed matter a great deal whether or not one believes that GC exists, at least for most such believers. Therefore, premise (c) of PW is false.

7. As another attack on premise (c), it may be that GC does not exist and, instead, some other being (e.g., the God of Islam) rules the universe. That being may dislike intensely (and may inflict infinite punishment on) anyone who believes that GC exists or who tries to self-induce such belief. A person who comes to believe that GC exists on the basis of PW would in that case be in "a heap of trouble." The expected utility of the Christian's belief situation would then be infinitely worse than that

of the non-Christian. It follows that premise (c) of PW can be doubted and is in need of some independent support, which has not been provided.

It should be noted that this objection, unlike objection 6, would still attack premise (c) even if that premise were revised to read as follows: "If GC were not to exist, then whether or not a person believes that GC exists would matter considerably less than in the situation where GC does exist." This revised premise, though it could perhaps withstand objection 6 and though it would suffice for the derivation of step (d), nevertheless succumbs to the possibility described in objection 7 in which it is the Christians who are at a great disadvantage.

8. Moving on to premise (e), it might be argued that to believe that GC exists, one must believe, not only the contradictions mentioned in objection 1, above, but also the doctrine of the Incarnation (or Trinity), according to which Jesus Christ is God (John 1:1; Col. 2:9) and the creator of the universe (John 1:3,10; Col. 1:16) as well as the Son of God (Matt. 3:17), also that Jesus was with God (John 1:1–2) and had a God (Mark 15:34; John 20:17), was created by God (Col. 1:15; Heb. 1:6) and begotten on a specific day (Acts 13:33, Heb. 1:5–6), that Jesus was both equal to his father (John 10:30) and inferior to his father (John 14:28) and presently sits at the right hand of God (Rom. 8:34; Col. 3:1). But all those things are a hodgepodge of contradictions, which it is impossible to genuinely believe. (Similar absurdities may be derivable from other Christian doctrines such as the doctrine of the Atonement.) Hence, it is impossible to genuinely believe that GC exists, which makes PW's premise (e) false. People cannot try to make themselves believe that which does not make logical sense.

9. One final consideration is that belief is not directly subject to the will, at least not in psychologically normal people. So even if such people were to comprehend something they did not believe, it would still not be possible for them to try to self-induce belief in it. Even the indirect methods of self-inducing belief advocated by Pascal (associating with people who hold the belief, etc.) are arguably irrational. Thus, premise (e) of PW is false, at least with regard to normal people.

Other objections to PW might be raised, especially ones that point toward the unethical character of GC as depicted in the argument, but (for space considerations) they are omitted here.

The General God Version. To avoid many of the above objections, PW could be applied only to God in general (i.e., God defined merely as the creator and ruler of the universe) rather than to the God of Christianity. Its second premise would then read:

> (b)' If God (in general) were to exist, then probably whoever believes that would gain eternal happiness in the afterlife, whereas whoever does not believe that would end up being eternally tormented.

The big problem here is that it is hard to find any reason whatever to accept the premise. That was not the case with regard to the previous (Christian) version. Although doubt could be expressed regarding premise (b), as shown in objections 2 through 5, above, there is nevertheless some significant biblical support for it. However, premise (b)' is a mere assertion lacking any support whatsoever. Assuming that God (in general) exists, there is no more reason to believe that he would reward all and only believers than that he would not do that. Without any backing for its second premise, this version of PW does not even get off the ground.

Perhaps the first three premises of the argument could be reconstructed as follows:

> (a)" There is some nonzero probability that God (in general) exists, that whoever believes that proposition would gain eternal happiness in an afterlife, and that whoever does not believe that proposition would end up being eternally tormented.
>
> (b)" Other situations, such as God not existing or God existing but there being no positive or negative payoff for people who do or do not believe that proposition, also have some nonzero probability.
>
> (c)" The mere truth of premise (a)" provides believers with an infinite expected utility.

The rest of the argument would proceed in a way similar to the original version. However, at least objections 2, 3, and 9, above, would still apply against this version of the argument. And even a version of objection 7 could be put forward. One of the premise-(b)" situations having a nonzero probability is that in which the world is ruled by a being who would inflict infinite punishment on anyone who believes that God (in general) exists or who would try to self-induce such belief. When that factor is entered into the expected-utility computations, it turns out that premise (c)" is false. The chance of the infinite positive payoff involved in the situation appealed to in (a)" would be canceled out by the risk of the infinite negative payoff involved in one of the situations appealed to in (b)". The result is that step (d)" cannot be derived. That is, there would be no way to show that the unbelievers are running a greater risk than the believers.

In the end we are led to the result, accepted by almost all philosophers, that PW is a failure. However it is formulated, it does not show any prudential irrationality whatever in being an unbeliever.

THEODORE DRANGE

PENTECOST, HUGH OWEN (1848–1907), American radical orator. Hugh O. Pentecost was born on September 30, 1848, at New Harmony, Indiana, moving at two to nearby Albion, Illinois, where he learned utopian social ideas as family traditions. He was a printer's apprentice for seven years, then in seminary for one. Preaching at twenty-three, he pastored at seven churches, including Baptist and Congregational churches and his own nonsectarian Church of the People. By 1887 he was also speaking for Henry George's single-tax movement. He married his second wife, Ida Gatling, daughter of the wealthy gun inventor, in 1880. In November 1887 at Newark, New Jersey, in a bold sermon titled "Four More Murdered Men," Pentecost denounced the execution of the Haymarket anarchists (see ANARCHISM AND UNBELIEF) from his pulpit. One month later, he resigned from Christianity altogether and began delivering lectures to his new Unity Congregation. With titles like "The Sins of Government," his talks appeared in early issues of his weekly *Twentieth Century* (started in 1888), defending both the single tax and philosophical anarchism. Though he always supported the rights of working people, he had distanced himself from organized labor by 1889 (see LABOR MOVEMENT AND UNBELIEF). As his family lost its fortune, Pentecost became a lawyer to secure an income. At the end of 1893, he was appointed as assistant district attorney through his wife's influence, but a storm of public outrage against the "anarchist attorney" prevented his being sworn in. In a public letter that the Democratic Party ordered him to write, he renounced the single tax as "utopian imaginings," stated that the Haymarket executions had been just, and swore loyalty to Tammany Hall. His otherwise stellar record for defending human freedom was permanently fouled. One anarchist labeled him a "blackmailed harlot"; another named him as an example of one's higher nature being degraded through marriage. Ruined in politics, Pentecost practiced law and resumed lecturing, focusing on FREETHOUGHT. When he died on February 2, 1907, he was warmly eulogized.

ROBERT P. HELMS

PERIODICALS OF UNBELIEF. A moderate number of freethinkers have come to and maintained unbelief by reading influential books including the Bible or the collected writings and speeches of such notables as Thomas PAINE, Robert Green INGERSOLL, the British socialist Robert Blatchford, and the like. From the mid-nineteenth century on, however, the reading habits and cultural assumptions of unbelievers were increasingly formed more from periodicals than from books. Over the past two centuries, the periodical has become a dominant medium of print publication used by large numbers of freethinkers on a regular basis, and periodicals of unbelief have been associated with all major movements of FREETHOUGHT during this period. Indeed, to read the literature of unbelief of the nineteenth and later centuries in an informed way, one needs to read through the lens of contemporaneous periodical readers.

Many hundreds of periodicals espousing worldviews of unbelief have been published in the last two centuries. These periodicals, issued at the local, regional, and national levels, have served varied special interests such as ATHEISM, RATIONALISM, SECULARISM, and HUMANISM, and have been published in dozens of countries. Despite the importance of these serials to an understanding of unbelief in general, they have been subjected to little scholarly analysis. No systematic survey of these publications has ever been issued. There are no reliable estimates of total world circulation, or even tentative estimates of the number of subscribers, to say nothing of readers, these periodicals may have reached even in the more developed countries. Still it is reasonable to assume a worldwide circulation today of at least several million.

Those who subscribe to a freethought—atheist, rationalist, or secularist—magazine or journal are rarely familiar with the range of periodicals that claim to interpret the world in terms of their own perspective of unbelief. And the larger public outside the freethought movements has little knowledge of such publications, or of the amount and type of influence such periodicals may exert.

This article deals with serial freethought works having

a publication frequency less than daily (*periodicals of unbelief* or *freethought periodicals*). Closely related terms such as *serials*, *journals*, *magazines*, or terms denoting frequency of publication (*monthlies*, *quarterlies*, *annuals*, etc.) will occasionally be used. Coverage will be restricted to publications of national or international scope, even though there have been hundreds more such publications of a relatively local, state/provincial, or regional focus in numerous countries. Only a few major titles will be cited. Titles, place(s), or frequency of publication may vary from time to time. The article will undertake (1) to provide some historical perspective for the different streams of periodical journalism of unbelief, (2) to specify the audience for such publications, (3) to indicate the special interests and presuppositions of that journalism and that audience, (4) to indicate the nature and diversity of periodicals of unbelief, and (5) to define how good a job this press has been, and is, doing.

Historical Perspective. A full-fledged historical treatment would require a history of the beginnings and early development of periodical publishing among unbelievers, discussing the major individuals and institutions responsible for the magazines and suggesting the circumstances in national history and culture that helped shape this press. However, because most studies have concentrated on the historical situation in England or the United States, the available information is primarily applicable to periodicals of these two major English-speaking countries.

Although freethought owed much to Enlightenment thought (see ENLIGHTENMENT, UNBELIEF DURING THE), the freethought movement emerged more or less full-fledged in the numerous radical democratic movements spawned first by the French Revolution (see FRANCE, UNBELIEF IN) and more fully in England, across much of Europe, and in the United States after the end of the Napoleonic wars (1815). After 1815, in England especially, a growing flood of pamphlets and periodicals attacked a wide range of political and social institutions, increasingly including organized religion. The British antireligious press was early intermixed with other secular forms of radicalism. Some such writings were less specifically focused, attacking Christianity (institutionalized and generally); many British writings attacked the Church of England (and its wealth) in particular. Ideological standpoints varied from an increasingly obsolescent DEISM to eccentric HERESY to explicit atheism. In periodical publications, the relative proportions of social, political, or religious attacks fluctuated over time; thus, the extent to which a given publication was strictly an organ of unbelief in the modern sense (as opposed to a more generically radical organ) is often difficult to specify.

Increasingly, the more influential among these writings were periodical in nature—whether issued regularly or irregularly with periodicities varying from daily to annual. Periodicals were well suited to publish the genre of the short essay focused on a single topic, and could offer the promise of periodic return to, and repeated emphasis upon, common enduring themes, in comparison to the definitive but lengthy one-time treatments usually presented in books or pamphlets. Also, short essays were typically seen as more suitable for those with little leisure time to read, and perhaps for those readers having little experience of following an extended argument.

Freethought periodicals gradually came to be sold, erratically, in a variety of news distribution centers beyond the traditional bookshop (which many purchasers would seldom or never visit), and their advertisements tended to reach a wider market than ads inserted in late nineteenth-century monographs and pamphlets. Further, the consumer of the product—the reader—was stimulated to buy succeeding numbers of the product at more or less regular intervals.

There were various social and legal hazards and stumbling blocks presented to the regular issuance of such publications. A major hazard in many countries was the legal concept of BLASPHEMY (an offense against the dominant national religion, being in England, for example, a crime under English common law); the upholders of the established order in church and state relied on blasphemy prosecutions in their attempts to muzzle the radical opposition's attacks on Christianity. In England in the eighteenth and nineteenth centuries, a local, perhaps idiosyncratic, barrier was the stamp tax on *newspapers* (which term over time seems to have come to denote publications produced with a frequency greater than every twenty-six days) imposed by statutory law. This tax was raised in 1815 to fourpence, at the time a rather high price that in effect priced legal newspapers out of the reach of the lower classes. Radical and freethought newspapers that refused to pay the stamp tax constituted an illegal underground press. As such, publishers, printers, and distributors were potentially subject to fine and imprisonment.

There consequently arose in both the radical and antireligious press an agitation against the stamp tax (sometimes called *taxes on knowledge*); freethought journals were caught up in this controversy. Writers and publishers of anti-Christian pamphlets and journals were frequently prosecuted in England, and some early nineteenth-century freethinkers—notably, Richard CARLILE and several of his associates and shopmen (and women)—were imprisoned for nonpayment of the stamp tax and/or for blasphemy, usually with success until 1842. Not surprisingly, religious periodicals that likewise failed to pay the tax (but that were not publishing blasphemy) were rarely prosecuted. (The stamp tax was reduced to a penny in 1836, and after 1842 successful prosecutions for blasphemy declined markedly.)

After 1840 in England (and somewhat later in Europe and the United States), freethought—atheism, AGNOSTICISM, secularism, and the like—developed as organized

movements, thus facilitating outreach to diverse markets including the large urban centers. In freethought as in many other movements, the inauguration of a journal has often served as a rite of passage indicating that a particular interest or faction within the movement has now come of age. Indeed, the journal has come to represent a formal or informal claim by a freethought group for public status. This trend was clear in England, Europe, and America, and in later years has been seen across the developing world. It has become increasingly common for a freethought periodical to be not a freestanding publication but the official organ of particular organizations, including book and pamphlet publishers. Although none may be said to be the sole or official journal of any particular secularist (etc.) movement, some periodicals having a particularly extensive circulation or influence may be perceived by the general public as representing a sort of quasi-official voice of freethought.

English Freethought. The emergence of organized English freethought largely reflected the efforts of one man, George Jacob HOLYOAKE, whose career, spanning most of the nineteenth century, combined freethought activities with social and political radicalism. Holyoake became a publisher of various periodicals in succession and was associated in these ventures at various times with other notable freethinkers. In the latter two-thirds of the nineteenth century, a number of other major freethinkers in Britain were associated with organizing efforts and with periodicals of unbelief. These include Annie BESANT, Charles BRADLAUGH, Robert Cooper, George William FOOTE, Robert OWEN, and Charles WATTS. Some major figures were associated primarily with organizing efforts, others such as W. Stewart ROSS and Charles SOUTHWELL more with publishing. One major stream, following Holyoake's lead and at various times associated briefly with him in one or another venture, was agnostic and somewhat politely secularist in orientation; the other, following Bradlaugh's lead, was more radically atheistic and aggressively secularist. The one stream later gave rise to the RATIONALIST PRESS ASSOCIATION (RPA), the other gave rise earlier to the NATIONAL SECULAR SOCIETY, both major publishers of books, pamphlets, and periodicals of unbelief in the twentieth century.

In the last decades of the nineteenth century, the most significant figure in the British freethought periodical press was Charles Albert WATTS, the son of Charles Watts, a leading figure in earlier organizational and publishing movements of unbelief. The younger Watts succeeded Holyoake at the *Secular Review* (later *Agnostic Journal*) and in general inherited the Holyoake tradition. In 1884 he assumed control of Charles Watts's printing, publishing, and bookselling concern, the principal London outlet for the freethought press. Watts primarily acted as a clearinghouse for freethought periodicals, although he did publish journals of his own including the monthly *Agnostic* (1885) and *Watts' Literary Guide* (1885–94, which became successively the *Literary Guide*, 1894–1956; then the *Humanist*, 1956–72; since 1972 *New Humanist*). The *Literary Guide* began as an advertiser for "liberal and advanced publications" (including freethought and nonfreethought radical publications) offered for sale by Watts and Company, and later also became the official organ of the Rationalist Press Association (1899–). Also associated with Watts and Company and the RPA was a distinguished annual issued under variant titles: *Agnostic Annual* (1884–93), *Agnostic Annual and Ethical Review* (1894–1907), *Rationalist Annual and Ethical Review* (1908–19), *R.P.A. Annual and Ethical Review* (1920–26), and *Rationalist Annual* (1927–66); this was succeeded by the annual *Question* (1967–80). From 1884 on, this annual consisted principally of focused essays or reviews upon major topics, initially primarily agnostic, then more generally rationalist, then secularist and even secular. The Watts/RPA books, pamphlets, and periodicals, generally high in quality, came to be dominant in the global British Empire market of unbelief for several decades after 1884. The *New Humanist* is even today England's most prestigious freethought journal (see UNITED KINGDOM, UNBELIEF IN).

Leading periodicals associated with the National Secular Society and/or its major figures included the *National Reformer* (1860–1993) and the *Freethinker* (1881–), both radical freethought publications of international as well as domestic stature.

The United Kingdom has produced dozens of other periodicals of unbelief in the nineteenth and twentieth centuries, several lasting well beyond a decade or two; this country is perhaps second only to the United States in the range and substantive scope of the periodicals of unbelief that it has produced. Until the twentieth century, British freethought periodicals were dominant worldwide; then for much of the twentieth century the United Kingdom shared this dominance with the United States. By the final quarter of the twentieth century, US periodicals of unbelief had become dominant in the world market of freethought. Particularly outstanding examples today include *Free Inquiry* and the *Secular Humanist Bulletin* (both originally published at Buffalo, now Amherst, New York).

In the United States hundreds of periodicals of unbelief were published in the nineteenth and twentieth centuries, including newspapers, newsletters, bulletins, journals, reviews, and other types. The list of fugitive, short-lived publications is extensive. However, a number of other periodicals have been relatively long-lived (e.g., *Age of Reason*; *AMERICAN RATIONALIST*; *BOSTON INVESTIGATOR*; the *Crucible* [Seattle]; *Ethical Outlook*; *Freethinker's* magazine, later *Free Thought* magazine; *Freethought Today* [Wisconsin]; *Humanistic Judaism* [Michigan]; the *Independent Pulpit* [Texas]; the *Index* [Toledo, Ohio, and Boston]; *Progressive World*; and *THE TRUTH SEEKER*), and many have been distributed worldwide (e.g., *American Atheist* and the *Humanist*). A few

US periodicals of unbelief, short- or long-lived, have been issued in languages other than English (e.g., *Freidenker* [Minnesota; German]; *Forskaren* [Minnesota; Swedish]; and others in Czech, French, German, Swedish, and other languages, to target major US ethnic groups with a substantial freethought heritage (see UNITED STATES, UNBELIEF IN).

Outside Europe and America during the nineteenth century, there was substantial competition from overseas publications, particularly from Britain. As with books and pamphlets, foreign periodicals, particularly British (and by the late nineteenth century and continuing today, American), have always found a ready audience generally throughout the British Empire, now the Commonwealth of Nations. British and American freethought periodicals could be relatively rapidly and cheaply imported, and often sold for less than their local imitators or competitors. The British and American publications had the advantage of well-known contributors, and in the nineteenth century the British periodicals in particular in many colonies could also draw on the nostalgia of a predominantly British émigré population. In non-British colonies, antireligious periodicals of the respective colonial power likewise competed with local products for readership. In numerous smaller English-speaking countries today (see INDIA, UNBELIEF IN), one continues to see this predominance of periodicals of unbelief distributed from the major publishing countries of North America and Europe, especially the United States and United Kingdom.

In colonies of the nineteenth-century British Empire, and in the United States through the first half of the nineteenth century, homegrown freethought journals faced various difficulties especially endemic to countries with relatively small populations: high production costs, failure to attract advertising, limited circulation, limited mass distribution beyond urban centers (until the development of railroads), and the like. Such factors continue to operate today against such journals in developing countries, within and outside the commonwealth.

In Australia, New Zealand, Canada, and probably other British colonies, early freethought periodicals tended to be largely derivative in both format and content from British and American models or competitors. Several freethought periodicals appeared in the latter half of the nineteenth century in Australia, mostly short-lived. The twentieth-century periodicals of unbelief in Australia have had longer runs, several today having continued in various forms for decades (e.g., *Australian Humanist*, *Australian Rationalist* [under various titles]; see AUSTRALIA, UNBELIEF IN). In the nineteenth century, New Zealand's need for freethought journals was apparently satisfied largely by British periodicals; the local products were all short-lived until well into the twentieth century, when the more long-lived *Open Society* (1927–; formerly *Truthseeker*, later *New Zealand Rationalist*, later *New Zealand Rationalist and Humanist*) and the *New Zealand Humanist* (ca. 1970–; see NEW ZEALAND, UNBELIEF IN) were published. Canada had few such publications in the nineteenth century, but *Avenir* (Montreal; French) ran from 1847 to 1857, and *Secular Thought* (Toronto), begun by Charles Watts during his Canadian sojourn, ran from 1885 to 1911. Since the mid-twentieth century, Canadian freethought journals have had much longer runs—for example, *Humanist in Canada*; now *Humanist Perspectives* (1967–) (see CANADA [ANGLOPHONE], UNBELIEF IN; CANADA [FRANCOPHONE], UNBELIEF IN). Periodicals of unbelief in India appeared mostly from the twentieth century on, but many of these persisted for extended periods of time (e.g., *Atheist* [Vijayawada], *Humanist Outlook* [Lucknow], *Radical Humanist* [various places], *Secularist* [Bombay, now Mumbai]), and a number are published today; major languages of publication have included English, Tamil, and Telegu.

The Anglo-American periodicals influenced periodicals of unbelief elsewhere in the nineteenth and twentieth centuries. In the twentieth century, the number of both Anglo-American and non-Anglo-American freethought periodicals exploded.

In continental Europe, periodicals attacking religion reached full force many decades later than in England, apparently not becoming a major publishing focus even in the leading capitals until about the 1880s or later. In Catholic countries (e.g., Western Mediterranean), periodicals of unbelief from their beginnings generally maintained a vigorous multidimensional thrust against the institutionalized basis of Roman Catholicism (anti-Papal, antihierarchical, anticlerical, antibiblical, etc.) and, often, to a lesser extent against Christianity more generally; in countries with major pluralist traditions (e.g., Germany and Switzerland), this thrust would be reversed. Leading twentieth-century European periodicals of unbelief include *Cahiers du Cercle Ernest-Renan*, *Cahiers Rationalistes*, *Libre Pensée* (France); *Freidenker*, *Wege ohne Dogma* (Germany); *Ragione* (Italy); *Vrijdenker* (successor to *De Dageraad*, the Netherlands); *Human-Etikk* (Norway); *Argumenty* (Poland); *Nauka i Religiya* (successor to *Antireligioznik*), *Voprosy Nauchnogo Ateizma* (Russia); and *Freidenker* (Switzerland). Many journals of this sort are also markedly radical politically (socialist or even anarchist), economically, and culturally, though they emphasize church-state issues most particularly. Hundreds of periodicals of unbelief have been published throughout Europe, mostly in the twentieth century and later (see FRANCE, UNBELIEF IN; GERMANY, UNBELIEF IN; ITALY, UNBELIEF IN; NETHERLANDS, THE, UNBELIEF IN; NETHERLANDS, THE, HUMANISM IN; NORWAY, UNBELIEF IN; SWITZERLAND, UNBELIEF IN).

Non-English-speaking European countries with substantial traditions of publishing periodicals of unbelief include, but are not limited to, Belgium, France, Germany, the Netherlands, Poland, the Soviet Union, and

Sweden (see BELGIUM, UNBELIEF IN). Italian twentieth-century ventures, mostly sputtering, in this domain were published mostly in Rome. Spain's limited record of publishing periodicals of unbelief was clearly exceeded in several former Latin American colonies (most notably, Argentina, Mexico, Uruguay; see LATIN AMERICA, UNBELIEF IN; LATIN AMERICAN LITERATURE, UNBELIEF IN). Little information was found for periodicals of unbelief in most Asian and African countries other than India (see AFRICA, UNBELIEF IN; INDONESIA AND SOME OTHER ISLAMIC COUNTRIES, UNBELIEF IN; NEPAL, UNBELIEF IN).

The leading international-scope periodical of unbelief is *International Humanist News*, published quarterly by the INTERNATIONAL HUMANIST AND ETHICAL UNION under this and similar titles since 1952 (see UNBELIEF AROUND THE WORLD).

The Control of, and Audience for, the Publications. Since their heyday in the nineteenth century, periodicals have exhibited many characteristics that have been fruitfully investigated as social aspects of journalism. For example, the publishers of periodicals, and also their contributors, become dominant within the ideology by virtue of their control of the material means of its propagation. The owners, editors, and contributors, of course, have more power to define their world and make their meanings stick than have their readers. Not unexpectedly, the dominant voices in freethought have generally controlled freethought periodicals, though usually leaving gaps for oppositional voices and oppositional discourse. A given publication thus exhibits an ideological center of unbelief; correspondingly, there are less obvious, more marginal, even subversive or liberal or orthodox-oriented views, pressuring the ideological center of unbelief represented by the proprietary and editorial interests of the periodical.

Accordingly, in the world of freethought, periodicals of unbelief are not merely a mirror of the culture of unbelief, or merely a secondary and derivative aspect of that culture, or merely a means of expressing that culture, rather these periodicals must be seen as a central component of that culture—part of the context within which freethinkers live and work and think, and from which they derive their perceptions of and reactions toward the larger world. From the early days of the nineteenth century, periodicals have been very much an interactive component of the world of unbelief, by both reporting the culture of unbelief and by driving its development.

That press likewise contributes to the construction of freethought and humanist opinion and identity. For subscribers themselves, a periodical of unbelief serves as a symbol of affiliation and "communication membership" with others of like mind.

Special Interests and Presuppositions of the Periodical Press. The earliest journals promoting unbelief—often organs of generically radical rather than merely antireligious thought—were intended to stir up the lower and middle classes, and aroused in the dominant classes and in the religious establishment anxieties of revolution. In the Anglo-American world and in the Western world more generally today, the goals of periodicals of unbelief are diverse and multifocal, but generally include those articulated by the RPA:

- To promote the study of rational thinking
- To encourage the spread of rational thinking in human conduct
- To fight irrationality and superstition wherever they affect human conduct
- To defend freedom of thought and inquiry, particularly where a rational approach to human affairs may conflict with traditional creeds and beliefs
- To advance a secular system of education, the main object of which shall be to cultivate in the young moral and intellectual fitness for social life

Today most of the leading periodicals of unbelief are multifocal in both their content and their intended audiences. Some such periodicals have expanded from an earlier niche and become more universal in scope: dozens of major topics of concern regularly recur between the covers of such publications as *Free Inquiry*, the *Freethinker*, the *New Humanist*, and dozens of other major periodicals. Indeed, one might characterize modern freethought periodicals as periodical supermarkets of unbelief. Meanwhile the book and pamphlet literature of unbelief has tended to focus upon elaborating major concerns and issues to an extent that cannot be addressed in the more facile and time-limited medium of the periodical journal essay.

Nature and Diversity of Periodicals of Unbelief. Over the course of the nineteenth and twentieth centuries, periodicals of unbelief have shown extreme diversity, even miscellaneity, of:

Frequency. The publication schedule may be weekly, biweekly or semimonthly, monthly, bimonthly, quarterly, semiannually, or annually. In the ealier days of the radical press, the newspaper tended to be preferred because of its frequency and cheapness. However, freethought matters generally lack the sense of urgency or timeliness that would typically fuel the publication schedule of a daily or weekly newspaper. Further, high-frequency publication might require a paid editor or staff and therefore a larger supporting circulation than a lesser-frequency publication schedule requires. Because of the economic limitations of their likely markets (the middle and lower classes), and perhaps because of the more ephemeral nature of the content of daily newspapers in a freethought milieu concerned with occasional repetition of issues of a more enduring character, the medium of choice for freethought periodical publishing became products of biweekly, monthly, quarterly, or lesser frequency. Because of the frequency of issue, in

contrast with books, periodicals of unbelief until recent decades were generally printed on relatively cheap paper, and with paper rather than board covers; indeed, they have been designed for speed of production and cheapness rather than durability. Some of the more prestigious such journals, especially in the Western world, are now printed on more durable paper, but still with paper covers. The typical periodical format, usually double- or multiple-column like that of the newspaper, has tended to encourage the use of small type and to fill up most of the space on all pages, by plugging empty portions with news items, poetry, or other filler material, in order to conserve paper, because the cost of paper became one of the most important components of the price.

Genre and Format. As in general with periodicals, content may include editorials; signed articles and/or reviews; current news announcements; notes and short notices; correspondence, especially to the editor; book reviews; advertisements; and perhaps other material such as poetry or cartoons may be included; some of these items may appear only occasionally in a given periodical.

Editorials and letters to the editor are generally developed or selected in accordance with some explicit or implicit (perhaps fluctuating) editorial policy.

Particular to freethought periodicals, signed articles and reviews tend to be philosophical, scientific, or anti-Christian, or at least opposed to revelation. Articles tend to be highly partisan, often tendentious.

News reports or announcements followed over time may be of distinct value in evaluating the waxing and waning success of a periodical or the organization or movement which it represents. One must be alert to possible bias in these reports, inasmuch as the periodical may represent a sort of party organ: during the nineteenth century the owners and editors of periodicals and/or sponsoring organizations participated in many of the events which they reported; further, the freethought press has admittedly often tended to exaggerate the importance of the freethought movement in the larger public scheme of things.

Book reviews may discuss a variety of major works in science, philosophy, theology, and the religion of the time. Emphasis tends to be on books published by the affiliated/sponsoring publisher, if any.

There is a major tendency to evaluate issues, books, and noteworthy individuals from the standpoint of how they further or impede the progress of rationalism/secularism/humanism. Reviews of eminent authors tend to put an emphasis on rationalistic or humanistic rebelliousness or commitment. It is of definite interest to note the names most often referred to with rational or deferential reverence by the magazine's less well-known contributors.

Topical notes may suggest much about the character of the magazine, its contributors, and the intellectual and social milieu of which they are a part; notes on the affiliated or sponsoring association's social functions—in the nineteenth century usually part of the principal periodical—now more often appear in a separate bulletin or newsletter, especially in the larger movements or organizations.

Advertisements suggest, by their number and the range of products offered, something about the nature of the readership, or, in some cases, perhaps what the advertisers *opine* about the nature of the readership.

Content. Although some freethought periodicals are clearly house organs, the periodical press of unbelief contains mostly serials of a different character. Like most material products, of course, the periodical is not only a product to be consumed; it also enters into the processes of signification or meaning making. The periodical is usually at least somewhat anticlerical (see ANTICLERICALISM), being generally opposed to religion and religious institutions; its characteristic topics are in opposition to religious traditions rather than being suffused with them. However, the culture of unbelief dominating these journals may serve as arenas of struggle over issues and techniques of dissent to be expressed, which secular domains to explore as battlegrounds for unbelief, and the like. Periodicals of unbelief typically offer contention and debate on a wide range of issues, some of which are largely secular in origin, such as models of religion as a whole, aspects of religion (especially Christianity), and secular domains where the emphasis is on the divorce from religious ideological or indoctrinational dominance. However, one must recognize the de facto plurality and diversity of voices between the covers; indeed, some such journals are notable for what has been called a "repressive tolerance," with gaps left for oppositional views. (Many freethought periodicals invite—sometimes urbanely, but often tauntingly—replies from believers to be published in subsequent issues with, of course, well-crafted editorial or other replies.)

Within a given periodical or individual issues, one may see various "conventional" expectations as to what to disbelieve, how or how much, contingency issues ("If _____ were found, would you continue to disbelieve *x*, or would you resume belief in *x*?"). Issues crucial to the history of the movement—including aesthetic standards, historical context, the crystallization and packaging of themes of unbelief, and the construction of identity of the unbeliever, among others—have shaped the movement itself and, accordingly, the fortunes of the periodicals and their sponsoring organizations, if any.

In some countries, especially Anglo-American countries, many periodicals of unbelief have been distinguished by contributions by leading secular authorities on culture, civilization, and historical and scientific topics; in other countries, especially in the third world, the press may comprise primarily organs of anticlericalism or at least polemical antireligion. In radical freethought periodicals associated with anarchist leaders (see ANARCHISM AND UNBELIEF), the art of invective has particularly flowered; terms used by European radicals

against the Catholic Church may be hurled against fundamentalist or evangelical leaders.

In periodicals associated with a publishing house, many contributors will be authors of books published by that publishing house. Indeed, many freethought/humanist writers have published works of unbelief initially in installments or initial trial essays in periodicals of unbelief, particularly periodicals associated with the subsequent book publisher. This was especially true of freethought novels in nineteenth-century England and America. Of course, major or more established freethinkers have often published freethought items in major elite magazines or other serials in the mainstream literature (such as the eminent "quarterly reviews" of Victorian England and, in the United States, the *North American Review* to which Robert Green INGERSOLL was a recurring contributor), especially in countries with traditionally strong general subcultures of unbelief.

Periodicals of unbelief are useful to identify not only the leading figures in a given organization or stream of freethought, but also many of the lesser members of a freethought movement. In periodicals of the nineteenth century in England, Europe, and the United States—and even well into the twentieth century in developing countries—contributed articles are often unsigned or pseudonymous. Over the years, however, the tendency has been for contributors to be specifically identified, perhaps with a brief note suggesting the interests or expertise of the writer in producing a focused essay on the topic at hand. Other features that yield important information about the lesser members of the movement include letters to the editor, reports of local activities from and about local activists, lists of names (for example, listings of subsidy contributors), obituary notices, and sometimes other items.

How Good a Job Is This Press Doing? Through most of the nineteenth century in countries other than England, the power of periodicals of unbelief to influence public opinion was largely confined to publishers in major urban centers; the expansion of means of mass distribution (especially railways) to effect shipment to remote locations boosted circulation and hence influence well beyond the major publishing centers.

Although in part intended to win converts to freethought, periodicals of unbelief have for the most part constituted variegated preachments to the already deconverted. The mid- and late Victorian freethought periodical press not only defended unbelief aggressively against Christianity, but, in the form of secularism (and in the twentieth century to the present time, in the form of humanism), this press increasingly defended unbelief for its own sake. The longer life span of freethought periodicals in the later Victorian and twentieth-century eras suggests that such psychological reinforcement has a definite and continuing function in the maintenance of unbelief. Also, by buying or subscribing to such periodicals, adherents of unbelief proclaimed their freethinking status more clearly than by formal membership in a freethought organization. Often, however, the two have gone hand in hand, the periodicals being a subscription benefit of membership in the organization.

For the larger secular world, the secularist press has to inform the public of the relevance of various freethought and secularist traditions to the problems we share in common; the scope of secularism's impact on society; and the associated need to show how secularist emphases promote better understanding of the economic, political, social, and cultural complexities of today's world. Secularist editors should always bear in mind that they should perform such tasks in the light of the same high standards that they invoke in commenting on the ideologies or performance of the religious community.

A small number of periodicals of unbelief fully recognize a mission much beyond their immediate constituency: to bring the messages of freethought to the forefront of the larger community; to convert the larger community in general to the policies, if not the doctrine, of freethought or secularism; to attempt to identify the universal relevance of freethought or secularism; or to endeavor to place contemporary political, social, and economic issues within a secularist context.

At their best, serials of unbelief enable open-minded outsiders in the community to perceive grave public issues in a framework more specifically focused than that of the ordinary secular magazine. A freethought organ moves beyond special pleading for unbelievers when it connects its views on education or some other domain with a conception of human nature and human objectives that can engage the adherents of both religious and secularist traditions.

The larger cultural community in general can benefit in understanding, even when it does not accept, either the sources or the content of the conclusions that are reached. Outsiders are necessarily faced with the problem of how to respond to the often disturbing ideologies of irreligion or secularism found in periodicals of unbelief.

BRUCE E. CATHEY

PERIYAR (ERODE V. RAMASWAMI NAICKER; 1879–1973), Indian atheist, organizer, businessman, and political activist. *Periyar* in Tamil means "great one," a title he acquired in 1938 at a conference of women in appreciation of his leadership and anti-Hindi agitation.

Periyar was born on September 17, 1879, as the second son of a well-to-do merchant in Erode, a city in Tamil Nadu, South India. *Naicker* indicates the caste to which he belonged. For most of his long life, Periyar was a convinced and active atheist (see ATHEISM). He may have been an atheist from the age of twelve, but it may be that he only became a convinced atheist after a visit to the holy city of Varanasi in 1904. It was, he discovered, no holier than any other city. The brahmins there, people belonging to the caste of priests, ate meat and drank toddy. Having become an atheist, he rarely wavered in his atheism. Periyar was also a strict teetotaler throughout his life.

As early as 1926, Periyar had warned against adopting Hindi as a national language. As Periyar saw it, the adoption of Hindi as a national language would strengthen the hand of the brahmins and weaken the influence of the Tamils and their language and culture. For many years Periyar also hoped to create a united front of Dravidians (south Indians) against the north Indians, but his influence remained restricted to Tamil Nadu, and even there it remained limited. On the other side, many in Tamil Nadu agreed with his Tamil nationalism, with its emphasis on the ancient roots and importance of Tamil language and culture.

The Self-Respect movement, with which Periyar identified himself during most of his life, is one of India's most interesting reform movements. The Self-Respect movement is often traced back to 1925, but it has also been claimed that it goes back to the Self-Respect League, which was founded by S. Ramanathan in 1926. Periyar was active in the Self-Respect movement at least from 1929.

To Periyar religion was the root of evil and injustice in society. In Periyar's opinion the brahmins used religion to dominate the people, and it should be replaced by RATIONALISM, in which Periyar put his trust. Periyar attacked the brahmins for their caste superiority. He was strongly opposed to the caste system and he fought untouchability (see INDIA, UNBELIEF IN).

As Periyar saw it, since religion was the main impediment to progress toward a just and equal society, it had to be eradicated and replaced by rationalism. Periyar thought highly of human reasoning capacities and saw a clear contrast between belief and reason. Rationalism for him stood for reason, development, and equality, whereas religion represented superstition, fear, exploitation, and irrationalism. For Periyar rationalism and religion were diametrically opposed to each other and excluded each other. For him rationalism also implied materialism (see MATERIALISM, PHILOSOPHICAL). In the booklet "Prakriti or Materialism," Periyar advocated a scientific alternative to religion. Only human reason can further true progress, but it is only in the last 150 years that reason really has started to play an important role. Rationalism also includes education, and Periyar firmly stressed the importance of education.

In his ethical views, Periyar emphasized social concern for equality and justice. As Periyar firmly rejected any transcendent power, he held that ethics is limited to and determined by life in this world. Among his rules of wisdom may be mentioned: "Accept what appears to be right and throw away the rest"; "What we expect from others we shall give to them" (a variant of the Golden Rule); "Man must think of others, make his own sacrifice, help others"; and "Rationalism must improve morality." In thinking of humans as rational beings, Periyar optimistically ascribed to them both goodwill and dignity. He emphasized social duty, equality, and justice. Three virtues or ideals were often repeated by Periyar: *Olukkam*, good behavior; *nanayam*, honesty; and *unmai*, truth.

Periyar's propaganda was organized through local groups supported from a central office, first at Erode, later at Tiruchirapalli and Madras (Chennai). In Tiruchirapalli, where Periyar mostly lived during his later years, he had his office and some of his archives. He ran a grade school and a teacher-training school, and he also invested money in other educational institutions. Periyar's speeches were extensively reported in daily papers and often reprinted. He wrote many propagandistic booklets. For his publications Periyar secured his own press facilities as the daily publications in Tamil Nadu, in his opinion, were controlled by brahmins or people sympathizing with brahmins.

Periyar died on December 24, 1973, at Vellore Christian Hospital in Tamil Nadu. His body was brought to Madras (Chennai), some 150 kilometers away, where he was buried on December 25 in a simple wooden coffin in a distinctly un-Hindu ceremony. Periyar was active until a few weeks before his death.

The vehemence of his attacks on theism can be gauged by the following words on his memorial in Chennai: "There is no God. There is no God. There is no God at all. He who invented God is a Fool. He who propagates God is a Scoundrel. He who worships God is a 'Barbarian.'"

FINNGEIR HIORTH

PFEFFER, LEO (1909–1993), American church-state activist. Born to an Orthodox Jewish rabbi in Hungary,

Leo Pfeffer came with his family to New York when he was two. He became the foremost church-state lawyer of the twentieth century. He was admired or scorned, depending on how strongly one believed in the separation of church and state.

Pfeffer attended public elementary and Jewish secondary schools. He graduated from City College of New York in 1930 and New York University Law School in 1933. In 1945 he joined the American Jewish Congress as staff attorney, the beginning of a career during which he became the principal church-state strategist for the American Jewish community. During the next four decades he wrote a multitude of amicus curiae (friend of the court) briefs and argued many cases before the US Supreme Court. He was so successful that many credit him for forging the Court's church-state doctrine during the 1960s and 1970s.

He also became a prolific scholar in the field, his *Church, State, and Freedom* (1953) becoming a classic. He also wrote on constitutional law generally and on the history of the Supreme Court. He taught at several universities, notably serving as professor and chair of political science at Long Island University, where he taught until 1985, all the while writing and arguing cases for the American Jewish Congress.

Although religious freedom was his forte, he also worked in the area of race relations. He recruited lawyers to represent civil rights workers in the South. In 1989 Leo and Freda Pfeffer endowed the International Pfeffer Peace Prize, awarded annually through the Fellowship of Reconciliation.

He was honored by many. Among these were the LHD degree from Hebrew Union College; the Trustee Award for Scholarly Achievement, Long Island University; the Thomas Jefferson Religious Freedom Award, Unitarian Universalist Association; Religious Freedom Award, Americans United for Separation of Church and State; Certificate of Merit, Council of Jewish Federations; Citation for Contributions to Public Education, Horace Mann League. The AMERICAN HUMANIST ASSOCIATION named him "Humanist of the Year" for 1988.

His Thought. A man of faith, Pfeffer was an observant Jew and regularly attended synagogue. But he was a strict separationist in his church-state philosophy. He believed that religion was an absolutely private matter. Civil government ought to have nothing to do with one's religious faith or practice, neither should it aid nor hinder religious groups in any way. He thought the authors of the Constitution believed as he did, that strict separation was best for the state and best for religious institutions. A self-described "absolutist" on the matter, he said: "Absolutists serve an important function in church-state law; any compromise becomes too often the starting point for further compromises." The practical implication of strict separationism was that prayer or religious instruction in public schools, government aid to church-related schools, religious requirements for public office, or property and income tax exemptions for religions were all unconstitutional. He was vigorously opposed by the Catholic leadership because he won so many cases opposing government aid to parochial schools and by some in the Jewish community who were afraid he would alienate so many Christians it would result in anti-Semitism. Toward the end of his life he began to see his separationist philosophy being eroded, both in Supreme Court decisions and among scholars.

He is widely credited with inventing the phrase "secular humanism" in his *Creeds in Competition* (1958). By this he did not mean antireligion, as the phrase was later used, but simply those unaffiliated with organized religion and concerned with human values.

His personal papers are in the George Arents Research Library at Syracuse University and the J. M. Dawson Institute of Church-State Studies at Baylor University. His library is at the Middletown, New York, Thrall Library.

RONALD B. FLOWERS

PHYSICALISM. Physicalism is a claim about what the mind is. It seeks to understand what it is; it does not deny its reality.

Physicalism is not a claim about how we know about the mind or about how we can describe it. The idea that psychological statements can be translated into physical statements is not a valid interpretation of physicalism. That is absurd. Human thought involves meanings and evaluations, whereas physics excludes meanings and evaluations from its subject matter. Further, psychological theory would be impossible if it referred only to atoms and molecules of the brain.

I will, in the next three sections, present some basic points about mental activity. They are not normally considered by common thinking, but they flow from its

intelligent application. This gives them a presumptive status, and I will not discuss objections to them by philosophers. These are crucial mental processes which must be accommodated by any deep theory of the mind.

Responsibility for what one does is central to the life of human beings. This requires continuity of the mental qualities and processes that make me what I am as a person. I must continue to be me. Any deep theory of the mind must come to terms with personal responsibility, and therefore with the continuity of the person. This requires:

The mental continuant: Whatever carries an individual's mental qualities and processes.

The idea of responsibility is essential to human living, but it is in tension with another essential quality: free will. Freedom requires that one could have done something different. But the idea of responsibility requires that what one is determines what one does; that is, given what one is, one would not choose otherwise (see DETERMINISM). This is a conundrum, whatever theory of mind one may hold. The outline of an answer is (I suggest) that my free will lies in my ability to determine what I do, on the basis of surveying what I know; deliberating; and reaching a conclusion according to my values. If my understanding of the world were different, or if my values were different, then my action would be different.

Intentionality: One knows about things in the external world by interacting with things in the external world. Consider seeing a British letter box. The letter box is red because its surface has a structure which reflects only red light. But no part of my mind reflects red light. I know the redness of the letter box because some aspect of my mental state represents it (the redness) as something I am seeing. This "aspect of my mental state" is a sensation. If I stop and think about it, I can think "I am having a sensation of redness" or "a sensation representing redness."

If you and I and a blind person have interacted with the external world, and in particular each other, you and the blind person can infer that I am having a sensation with the abstract quality "representing redness." We all can know this abstract quality, but the sensation as I feel it, its felt-quality, is private to me. I know the character of my sensation because I have it; other people infer an abstract description of its character as "representing redness." The blind person knows that I am having a sensation such as normal people have when confronted by a red object. (My vision is normal.)

Other manifestations of intentionality are language, and theories about the world.

The setting up of these mental states and processes take place at particular times. This historical basis is essential for the formation of the human mind.

Consciousness: The human mind spends much of its time being conscious. It also manifests unconscious thoughts, beliefs, and evaluations; and blindsight; and the representation of the environment that guides routine activities like driving to work; and split-brain phenomena; and ambiguous mental states like dreaming. All these are mental states and processes.

> Being conscious is a system of mental states and processes being active. The range of mental states and processes which may constitute an individual's consciousness is to be discovered by empirical inquiry, interpreting current usage of the term.

> Physicalism (in a wide sense) does not presuppose any particular identification of the mental states which constitute consciousness. Peter Carruthers discusses many aspects of consciousness.

A key feature of human consciousness is a unified representation of the environment, of the individual, and of his or her thoughts, ideas, feelings, and values; with the individual able to attend severally to elements of the world and of his or her mental state, to focus on one of them and to perceive it in more detail (to some extent), and to think about them, form theories about them, and evaluate them. This sets human beings apart from all other animals; for human beings can come, progressively, toward understanding the world and basing their ideas, theories, and values on the way it really is. This gives them enormous advantages.

Consciousness normally includes representations of "things" set, where appropriate, in the space of the shared world, and with a time. This is an identity: there is no causal relation; there is no separation. Seeing a thing is having a representation of it. "Seeing a letter box" is seeing a letter box, not seeing a representation of a letter box. When one is conscious, one is conscious of "things," not of their representations, with the suggestion that we are like viewers in a cinema. I have my sensation with its felt-quality, and I am conscious of the quality in the world it represents.

NATURALISM. *Physicalism* provides an appropriate name for this deep theory of the mind, but "physics" can not be the basis for analysis until we have defined the scope of "physics." *Materialism* is not appropriate, because physics has already established that matter is not enough. The key concept is:

> A theory or phenomenon is *naturalistic* if that theory or phenomenon does not involve values, purposes, or meanings which do not derive from evaluations by, or the intentionality of, beings limited by material bodies of moderate size.

In a naturalistic universe, "the physical sciences" can be defined: "The sciences of those processes which do not depend on biological or psychological processes." Biology is not "a physical science," but it and physics are naturalistic, for they do not involve values, purposes, or meanings. Psychology and physicalism are concerned

with evaluations, purposes, and meanings; but these are attributed to persons limited by material bodies.

Definition of Physicalism. I first define a more general concept of physicalism, then the specific form which I will defend.

Physicalism presupposes that the universe is naturalistic: in particular, all parts of a person's body are governed by naturalistic laws, and the human species evolved by naturalistic processes. It claims:

(1) The *mental continuant* consists of certain parts of the functioning body of an individual who is of an appropriately evolved species.
(2) The identification of the relevant parts of the body is a matter for empirical inquiry, about which physicalism makes no particular claims. However, neurons are obviously the major component, and I will use neurons as representative of the mental continuant.

The defining characteristics of *biographical physicalism* make clear that it does not deny the reality of mind. The point lies elsewhere.

Biographical physicalism claims:

(1) A *person* is constituted of a moderate-sized material body with a mind.
(2) A *mind* is constituted of mental states and processes, and these only, these being carried by neurons.
(3) The mental state *carried* by a neuronal state of an individual is the mental attributes given to the neuronal state by the processes which generated it. First, interactions with the environment experienced by the individual's ancestors established the individual's species-nature; this gives each individual of the species a system of neuronal states that serves functions characteristic of mind, and propensities to generate further mental attributes. Second, the individual's interactions with the external world, and his or her responses to them, generate the particular mental states carried by particular neuronal states. (Some mental states involve other bodily processes: for example, fear involves adrenaline. I can not here consider these other processes.)

The identification of the neuronal or other structures that carry given kinds of mental processes is a matter for empirical inquiry.

Evolution is the prehistory of the human mind. At an individual's birth one's mental qualities are largely latent; but one quickly develops understanding and the ability to discriminate, deliberate, and choose. One's mind is then created in the course of one's interactions with the world, largely according to one's own decisions.

The evolution of one's species, with one's personal biography, determine the way one's consciousness works out—"What it is like to be me." The evolution of the bat mind, and the biography of a bat, determine what it is like to be a bat (cf. Thomas Nagel). Bats and humans each have their sensations. These have their respective felt-qualities, and they represent "things" set in the shared three-dimensional space of the real world.

In a sense, the process of constructing a mind is like programming a computer. But there is no programmer, for a "programmer" is an agent external to the "computer." First, during the evolution of the species and some of the early stages after birth of the individual, one might say that the programmer is reality. But reality is not an "agent." Second, as the individual matures, and one's processes of consideration and decision become effective, we might say that the individual oneself is the programmer. But one's self is not "external."

Biographical Physicalism Is a Scientific Theory. The broad concept of physicalism goes no further than to identify the mental continuant. The theory would have been impossible if the contents of the skull had been different—a reservoir of fat against bad times, perhaps. Therefore it is refutable in Karl POPPER's sense, though not refuted. Therefore physicalism is a scientific theory. Physicalism enters as a plausible theory because the human body includes a structure (the neuronal system) of an order of complexity such that it could carry mental processes as we know them.

Biographical physicalism adds the claim that mental attributes are carried by neuronal systems, and specifies how the relations are set up. It is a scientific theory because it would be rendered untenable if continued effort on some mental attribute sharpened the problems rather than clarifying the solution. It would fade into absurdity. Scientists will establish the balance of the evidence here for and against biographical physicalism.

There is no question of a clear-cut proof or refutation for the identification of the mind. It is in the same logical position as the identification of the causes of lung cancer. Each theory is claiming that its analysis has caught the key factors, subject to adjustment of detail. Nothing can prove or refute such claims; for they amount to the claim that there is nothing more of comparable significance in the phenomenon in question. But if the progress of brain science and evolutionary psychology continues well, those who refuse the evidence could become like the tobacco companies who refused to accept the "proofs" that smoking causes lung cancer.

The processes of the mental continuant are not introspectable. One "sees the red patch," one does not see what is going on when one "sees the red patch." One knows what "being conscious" feels like, not what is going on when one is conscious. Even Harry has no authority in determining what constitutes "Harry seeing a red patch" or "Harry being conscious"; and no one else is better placed. It requires empirical investigation by

psychologists and physiologists, and scientific theorizing. I believe the analysis I am outlining implements contemporary thinking by these scientists.

An individual is "seeing a red patch" because his or her neuronal system representing "red" is linked to his or her "external world" neuronal system. These neuronal systems represent color, and the space of the external world, because primitive forms of them, used as such, did indeed represent the color and space of the external world, and gave his or her ancestors survival advantage. Consider a bee. It has a visual system because this enables it to find a flower and get honey from it. Semir Zeki describes the complexities of human vision. The innate structures of human beings represent reality, in their complex ways, and allow us to theorize about it and value bits of it, because this has enabled individuals to survive and (in recent times) to live better lives. Morality is a particular development. It is of unique importance because its criteria are uniquely important (see MORALITY FROM A HUMANIST POSITION; ETHICS AND UNBELIEF).

Some scientists and philosophers argue that the very idea of a physicalist account of consciousness is "absurd" or "impossible." But the existence of such charges against a fundamental scientific theory by no means establishes that the theory is wrong. The theory of relativity is a classic example of a scientific theory thus attacked. The critics simply had not come to terms with the radical novelty in the theory. Biographical physicalism does not identify mind or mental processes with physiological objects or physiological processes. Biography is essential to the identity of a mind. And this makes all the difference.

HARRY STOPES-ROE

POPPER, KARL RAIMUND (1902–1994), English philosopher. Born in Vienna, Popper became a Marxist in his early and middle teens (see MARX, KARL; MARXISM), aligning himself with communists for two or three months. Near the age of seventeen, he became an anti-Marxist. The Marxists' intellectual presumption, dogmatism, and unwillingness to fight against the fascists in Austria revolted him. "Scientific socialism" seemed not to exemplify the scientific attitude he discovered in Albert Einstein, who exposed his own theory to criticism and critical testing. The years between the two world wars were both grim and exhilarating for Popper. While serving in Austria as a social worker and teacher, he continued to read ravenously and to study music. He chose the history of music as a second subject for his PhD examination. He conjectured that musical and scientific creation had much in common. A kind of preliminary dogmatism (e.g., the canonization of the Gregorian melodies) provided the necessary scaffolding or frame of coordinates needed for exploring the possible order of the new unknown. He argued that science, beginning with myth (and later metaphysics), developed the critical method, speeding up and intensifying the process of trial and error. Against the background of old coordinates, the bold imagination of the great scientists and musicians imposed new possibilities and models that could be subjected to correction and improvement. Popper argued that in both creative music and creative science, problems surfaced and sometimes became articulated. His study of Ludwig von Beethoven's notebooks disclosed a creative composer hard at work, trying version after version of an idea to clarify and simplify it.

Though Popper was never a positivist (see POSITIVISM) or a member of the esteemed Vienna Circle of philosophers (see SCHLICK, MORITZ, AND THE VIENNA CIRCLE), one member nicknamed him "the Official Opposition." His criticisms of VERIFICATIONISM took their toll on positivism, eventually bringing about its demise. Aware of Adolf Hitler's expanding anti-Semitism and knowing that an individual of Jewish origin stood little chance of becoming a university professor in Austria, Popper accepted an invitation to teach at the University of New Zealand. There he worked closely with neurophysiologist John Eccles, who later won the Nobel Prize and recommended Popper's teachings on philosophy of science and scientific investigation.

During World War II, Popper worked on *The Open Society and Its Enemies* (1945), an unprecedented two-volume defense of liberty. This work, along with *The Poverty of Historicism* (1936), helped initiate his international reputation. His first book in philosophy of science, *Logik der Forschung* (1934–35), was translated into English under the title *The Logic of Scientific Discovery* (1959). After sailing around Cape Horn to begin teaching logic and philosophy of science at the London School of Economics in 1946, he encountered many of England's most influential philosophers and scientists, among them Bertrand RUSSELL and Ludwig WITTGENSTEIN. The latter had gained a reputation by contending that philosophy had only puzzles (mostly linguistic) rather than genuine problems to solve. Popper never succeeded in drawing Wittgenstein out in an unemotional, rational discussion of this issue.

While still in Austria, Popper had developed the thesis that far from needing the induction myth, science oper-

ated by deducing consequences from content-rich theories that could be severely tested. The process of articulating in-depth theories and falsifying at least aspects of them, Popper argued, offered the possibility of creating better theories. His postwar lectures, articles, and books spelled out his "critical rationalism" for physics, psychology, and biology. His wrestling with the views of such physicists as Erwin Schrödinger, Niels Bohr, Ludwig Boltzmann, Einstein, Ernst Mach, and Werner Heisenberg proved fruitful. His discussions with Schrödinger and Einstein in particular challenged him to clarify his theories of indeterminism, objectivism, and realism. The last two views served as instruments for opposing the rising subjectivism in physics and essentialism in philosophy.

Like all great philosophers, Popper learned from scholars and specialists who were not philosophers by profession. In England, Ernst H. Gombrich (author of *Art and Illusion*), Friedrich August von Hayek, Peter Medawar, and L. Robbins profoundly influenced him. In 1950 he gave the Harvard University William James Lectures. This first visit to America made a tremendous difference to his life. He renewed old friendships from Europe and made new friends, including the great physicist Percy Bridgman. Both Einstein and Bohr attended his lecture at Princeton. Einstein insisted that Popper meet with him to discuss indeterminism. Against Einstein's determinism, which amounted to a four-dimensional Parmenidean block universe, Popper argued for the reality of time and change: In an "open" universe, "the future was in no sense contained in the past or present, even though they do impose severe restrictions on it." Earlier, Popper had argued that the evolution of physics was likely to be an endless process of correction and better approximation to truth about the cosmos.

Ironically, Popper's spreading international fame helped increase the number of readers who seemed content to read extracted passages from his books without reading any of them as a whole. His highly influential *The Open Society and Its Enemies* attracted many readers, some evidentially unwilling to appraise its arguments. By contrast, the British writer, philosopher, and member of Parliament Bryan Magee accustomed himself to Popper's terminology. He concluded that all of Popper's work "is super-abundantly rich in argument." He placed Popper among the four philosophers who would more likely appear to future generations as the most interesting of the twentieth century.

Popper's *Conjectures and Refutations: The Growth of Scientific Knowledge*, a truly remarkable book of scope and depth, was published in 1963; the fifth edition (revised) appeared in 1989. This book alone, strewn with stunning insights and clear argument, would have placed any writer among the luminaries of philosophy. His highly sophisticated theories are for the most part written in commonsense language and with a down-to-earthness that has earned him well-deserved praise. His decades of fascination with "Darwinism as a metaphysical Research Programme" led to his giving the 1961 Herbert Spencer Memorial Lectures in Oxford under the title "Evolution and the Tree of Knowledge." His 1972 *Objective Knowledge: An Evolutionary Approach* gave him the opportunity to reply to his critics by indicating either how he learned from them or how some failed to read him carefully. In both this work and *The Self and Its Brain* (1977, coauthored with John Eccles), important similarities (and differences) with process philosophy in the United States become apparent. He had often expressed his admiration of the work of Charles Sanders Peirce and his notion of "objective chance." In Popper's words, "the first emergence of a novelty such as life may change the possibilities or propensities in the universe. . . . [T]he newly emergent entities, both micro and macro, change the propensities, micro and macro, in their neighborhood. . . . [T]hey create *new fields of propensities*, as a new star creates a new field of gravitation."

JOE EDWARD BARNHART

PORTUGUESE LITERATURE, UNBELIEF IN. Although the word *unbelief* has a wider meaning, we shall restrict ourselves to consideration of religious disbelief in Portuguese literature. Religious feeling in Portugal is strong and of long standing (reflected in general adherence to the Catholic Church). Since this piety has been reflected

in Portuguese literature since its inception, this article will briefly discuss the way in which unbelief appeared and how it found a place in the Portuguese literature during the nineteenth and twentieth centuries.

In the nineteenth century, Romanticism—in Portugal as throughout Europe—was characterized by a return to religiosity in a reaction to the RATIONALISM that had characterized the century of the Enlightenment (see ENLIGHTENMENT, UNBELIEF DURING THE). Some romantic authors exalted the moral values of Christianity, while others preferred the aesthetic and sentimental side of the faith. However this religious fever did not hinder the first and greatest Portuguese Romantic writers, Almeida Garrett and Alexander Herculano, from breaking free of Catholic institutional teaching and disputing the power of the church. Both liberal catholics, Garrett and Herculano contributed to the secularization of Portuguese culture and pressed for the separation of state and church. Garrett, the more worldly of the two, celebrated the modernization of behavioral norms, rejected any form of Catholic conservatism, and openly denounced the clergy for its corruption and its alliance with the powerful (see his historical novel *O Arco de Sant'Ana* [The Arch of Saint Ann]). For his part, Herculano defended public civil marriage and questioned the historical veracity of some elements of official doctrine. In particular he questioned the dogma of the Immaculate Conception and allegations of a miracle of the Battle of Ourique (1139), in which the fledgling Portuguese nation had won a critical battle against the Moors, supposedly through divine intervention. In his novel *Eurico, o Presbítero* (Eurico the Minister), a genuine best seller of its day, he criticized celibacy as a requirement for the priesthood. Another well-known Romantic writer was Camilo Castelo Branco, author of *Amor de Perdição* (Disgraceful Love). Branco lived his life with little regard for Catholic teachings and he engaged in polemics against the church.

The literature of the second half of the nineteenth century was deeply influenced by the emerging positivist philosophies (see POSITIVISM) and therefore leaned toward scientific reason with an iconoclastic and even a Jacobin flavor. The main figures of this period, known as the "Generation of '70," were engaged in a remarkable polemic against Romanticism published in Coimbra in 1865. They mounted an intense campaign of ANTICLERICALISM spread across a remarkable range of genres. These include some realistic novels of the author who is probably the greatest prose stylist in the Portuguese language, Eça de Queirós, *O Crime do Padre Amado* (The Crime of Father Amado) and *A Relíquia* (The Relic); the satirical poems of Guerra Junqueiro, such as *A Velhice do Padre Eterno* (The Oldness of the Perpetual Priest); and the chronicles of Ramalho Ortigão and of Fialho de Almeida. But there were others, as well: poet and philosopher Antero de Quental, who indicted the church and its influence in his *Causas da Decadência dos Povos Peninsulares* (Causes of Decadence of Iberian People), and historian Oliveira Martins, who is remembered for his *Portugal Contemporâneo* (Contemporary Portugal). All of these writers defended the ideal of a secular and progressive society in which reason, science, and social morality should completely replace dogmas and religious pedagogy. They did not dispute the historicity of Jesus Christ or the evangelical thrust of the gospels, but they considered Catholicism in general—and the influence of the clergy in social life and politics in particular—obsolete and alienating.

The strong positivist movement ushered in its own dialectical reaction in later years: the fin-de-siècle Neo-Romantic movement displayed some return to religious values, a revival of mystical spirituality, and a return to the traditions of national culture.

The twentieth century would bring modernity. In 1910 the republic was established and in 1911 the state was officially separated from the church. The poets of the so-called First Modernism in the teens and twenties included great Portuguese poets like Fernando Pessoa, who published but a single book-length work during his life, the esoteric-patriotic poem *Mensagem* (Message); and Mário de Sá-Carneiro, author of *Confissões de Lúcio* (Lúcio's Confessions). Both were personally relatively indifferent in matters of religion. Fernando Pessoa was a believer in esotericism, astrology in particular. However, the "Second Modernism" of the thirties and forties—which included writers and poets such as José Régio, author of *Poemas de Deus e do Diabo* (Poems of God and Devil), and Miguel Torga, author of *Contos da Montanha* (Tales from the Mountains)—ushered in a Christian humanism marked once again by some anticlericalism, though not so pronounced as it was among some realists at the end of the nineteenth century.

Given his originality and his worldwide fame, Fernando Pessoa deserves special mention. Pessoa wrote in his own name and as a series of heteronyms, or literary alter egos: Alberto Caeiro, Álvaro de Campos, Ricardo Reis, Alexander Search, and others, each with a completely distinct personality, background, and style. For example, Alberto Caeiro was a keeper of sheep, contemplative and sensual, while Álvaro de Campos was a naval engineer, worldly and a futurist. Both expressed SKEPTICISM regarding God and religion. Caeiro admired nature instead of God, while Campos admired the power and diversity of technology. Wrote Caeiro:

> To think of God is to disobey God
> Because God wanted us not to know him,
> And therefore did not show himself to us . . .

Campos wrote:

> And in each corner of my soul there's an altar to a different god.

Of the many writers who followed, in regard to religious unbelief, two names deserve particular attention: Vergílio Ferreira and José Saramago.

Vergílio Ferreira, not well known outside of Portugal (his works have been translated only into Spanish and French), is the author of *Manhã Sumersa* (Submerged Morning), *Aparição* (Appearance), and *Para Sempre* (Forever). He was a philosophical writer, sympathetic with the existentialism of Jean-Paul SARTRE. He declared himself an atheist after a somewhat traumatic experience during his infancy at a Catholic seminary (this is told in his book *Manhã Submersa*). His characters, faithful to their author, declare the death of God: only the man remains, with all his anguishes, in particular the anguish of death. Ferreira wrote: "Nobody can be instead of us—not even God." The only substitute for God—inadequate as it may be—would be art.

On the other hand, José Saramago, Nobel laureate in literature in 1998—to date, the only Portuguese so honored—wrote *Memorial do Convento* (Baltazar and Blimunda), regarding the construction of a great baroque monastery. The retitling of the English version refers to the two main characters: Baltazar, who has a single hand, and Blimunda, who possesses paranormal powers. In a magical scene these two representatives of the common people fly in a primitive balloon together with a priest who is being pursued by the Inquisition. Saramago's other works include *O Ano da Morte de Ricardo Reis* (The Year of the Death of Ricardo Reis), concerning the return of Ricardo Reis to Lisbon after his death; *Evangelho Segundo Jesus Cristo* (The gospel according to Jesus Christ, a story of Jesus told in the first person, contravening tradition); and *Ensaio sobre a Cegueira* (Blindness). Saramago is a declared unbeliever in God but its incredulity extends far beyond the religious domain. It can even be said that he is a radical pessimist, since he thinks that humankind is its own worst enemy. He is also known for his skeptical positions regarding progress and the contribution of science and technology to social well-being. His SECULARISM is clear in *Evangelho Segundo Jesus Cristo*, which caused a scandal in Portugal when it appeared. His atheistic position is evident in his essay "The God Factor," which he published in the press shortly after the attacks on the Twin Towers on September 11, 2001: "Nietzsche said that all was permissible if God did not exist, and I reply that it is precisely because of God and in God's name that everything has been permitted and justified, principally the worst of things, principally the most cruel and horrendous." For Saramago, belief in God may be the source of the greatest evil.

POSITIVISM. Positivism is a philosophical current akin to empiricism and NATURALISM. In the literature one can find a distinction between legal positivism, moral positivism, and positivist philosophy. Legal positivism is the theory that the law of the state is based on the will of the holder of sovereign power in the state, whereas moral positivism, also known as theological voluntarism or the divine command theory, is the theory that God's commands in themselves make certain actions right and others wrong.

Positivist philosophy, *positive philosophy*, and *positivism* are terms used to designate a worldview that is conceived of as being in tune with modern science, and which accordingly rejects superstition, religion, and metaphysics as prescientific forms of thought which will cede to positive science as humankind continues its progress. This usage is derived from Auguste COMTE who established it in his writings, especially from the 1830s on.

The Frenchman Comte invented the term *sociology*, and has often been considered to be the founder of sociology. What is distinctive about Comte's positivism in its first form is its attempt to describe the history of human thought as evolving through certain definite stages, which he called the religious, the metaphysical, and the scientific. Of these, the last was the most productive and valuable, though the earlier ones had their value too and were not to be simply dismissed as primitive and useless. Indeed, toward the end of his life Comte himself thought it necessary to introduce a religion of humanity, a reli-

gion that still survives in France, Brazil, and Chile.

According to positivist theories of knowledge, *all* knowledge, or at least all empirical knowledge, is ultimately based on sense experience. There cannot be different kinds of knowledge. Positivist theories of knowledge do not always recognize a sharp distinction between the formal sciences (logic and mathematics) and the empirical sciences (all other sciences). All genuine inquiry is said to be concerned with the description and explanation of empirical facts. There is no difference in principle between the methods of the physical and the social sciences, for example.

Nonpositivist theories of knowledge often emphasize the difference between formal sciences and empirical sciences. This distinction is often neglected in positivist theories of knowledge.

Empiricist philosophers like Francis Bacon and David HUME can be regarded as precursors of positivism. In the nineteenth century important representatives of positivism, apart from Comte, were Herbert SPENCER, Ernst HAECKEL, Richard Avenarius, and Ernst Mach. These four thinkers have not always been called positivists, but they have all been close to positivism in a broad sense of the word.

Positivist ideas gained a foothold in the public mind and were accepted by many radical philosophers and progressive intellectuals. In England, for instance, there were the authors George Henry Lewes and George ELIOT and the philosopher John Stuart MILL. Lewes published the book *Comte's Philosophy of the Sciences* (1853), which contributed greatly to making Comte's ideas known in the English-speaking world.

As to Mill, it seems that he first was attracted to Comte's positivism. But later, in his 1865 *Auguste Comte and Positivism*, Mill was quite critical of Comte's philosophy.

From the 1850s onward, Comtean positivism gained a marked influence in France and came to expression in anticlerical and anticonservative politics (see ANTICLERICALISM). This was even more the case in some countries in Latin America. The ideas behind the revolution in Brazil in 1889 were positivist (see LATIN AMERICA, UNBELIEF IN), and the Brazilian flag carries the positivist motto "Order and Progress."

In sharp contrast to positivism in the nineteenth century, there is no comparable political dimension in the predominant variety of twentieth-century positivism, that is, the philosophical outlook advocated by members of the Vienna Circle. This circle was particularly active during the years 1924 to 1936 and its members included Moritz SCHLICK, Rudolf Carnap, and Otto Neurath.

The British philosopher Alfred Jules AYER was in his youth deeply influenced by the ideas of the Vienna Circle. These ideas became known as *LOGICAL POSITIVISM*, a label first given to the movement in articles by Eino Kaila and Åke Petzäll, two Nordic sympathizers, around 1930. Logical positivism, also known as logical empiricism, differed from earlier versions of positivism in its approach to the formal sciences (logic and mathematics), but agreed with the earlier varieties in its empiricism and its emphatic rejection of metaphysics.

Between 1924 and 1936, the main center of logical positivism was the Vienna Circle. The Vienna Circle evolved in 1923 out of a seminar led by Schlick and attended, among other students, by Friedrich Waismann and Herbert Feigl. Schlick began teaching in 1922, and in 1925 out of this nucleus a Thursday evening discussion group was formed. Many of the participants were not professional philosophers. Even if some of them taught philosophy, their original fields of study lay in other fields. Schlick, for example, had specialized in physics, and his doctor's thesis, written under the guidance of Max Planck in Berlin, concerned a problem in theoretical optics.

Active members of the Vienna Circle during its first years were, in addition to Schlick, Feigl, and Waismann, the mathematician Hans J. Hahn, the sociologist Neurath, the historian Victor Kraft, the lawyer Felix Kaufmann, and the mathematician Kurt Reidemeister. An occasional but important visitor was the physicist Philipp Frank, based in Prague at that time.

In 1927 and again in 1932, the Finnish psychologist and philosopher Eino Kaila was present as an active and important member. Another visitor from Scandinavia was the Swede Åke Petzäll. Among the younger participants was the mathematician and logician Kurt Gödel and the philosopher Gustav Bergmann. Other visitors were Carl G. Hempel of Berlin, A. E. Blumberg of Baltimore, and Alfred Jules Ayer of Oxford. Among those more loosely affiliated with the group were Karl Menger, E. Zilsel, Karl POPPER, Hans Kelsen, Ludwig von Bertalanffy, Heinrich Gomperz, and B. von Juhos.

The most decisive and rapid development of ideas began in 1926 when Rudolf Carnap was called to the University of Vienna. His contributions to axiomatics and his theory of the constitution of empirical concepts (as published in *Der logische Aufbau der Welt*, 1928) proved a source of very stimulating discussions.

Also in 1926, Ludwig WITTGENSTEIN's *Tractatus Logico-Philosophicus* was studied in the circle. The philosophical position of logical positivism at the end of the 1920s was the outcome of these incisive influences. Though a number of the basic ideas had already been enunciated in a general manner by Schlick, they were formulated more fully and more radically by Carnap. Schlick was deeply influenced by Carnap, but perhaps even more by Wittgenstein, who at that time lived in Austria.

In contrast to Carnap, who between 1926 and 1930 was a regular and most influential participant in the Vienna Circle, Wittgenstein associated only occasionally with some members of the circle. It seems that Wittgenstein never attended any meetings of the Vienna Circle. Even so, participants obtained some information about obscure passages of his extremely condensed (and to some extent also profound) *Tractatus*.

An exposition of the work and worldview of the Vienna Circle was given in 1929 in a pamphlet titled *Wissenschaftliche Weltauffassung: Der Wiener Kreis* (Scientific Worldview: The Vienna Circle) written by Hahn, Neurath, and Carnap. Here, the aim of the Vienna Circle was said to be to form a unified science comprising all knowledge of reality accessible to humanity without dividing it into separate, unconnected special disciplines such as physics and psychology, natural science and letters, philosophy, and the special sciences. The way to attain this aim was by the use of the logical method of analysis, a method said to have been worked out by Peano, Frege, Whitehead, and Russell, a method that could serve to eliminate metaphysical problems and assertions as meaningless, as well as to clarify the meaning of concepts and sentences of empirical science by showing their immediately observable content: *the given* (das Gegebene).

In 1936 the English philosopher Alfred J. Ayer published his book *Language, Truth and Logic.* The book was a sensation and soon became an important manifesto of logical positivism. The book was written with much greater fervor than is common with philosophical books.

In his argumentation, Ayer among other things states that "if 'god' is a metaphysical term, then it cannot even be probable that a god exists. For to say that 'God exists' is to make a metaphysical utterance which cannot be either true or false. And by the same criterion, no sentence which purports to describe the nature of a transcendent god can possess any literal significance."

As seen by Ayer in 1936, and in 1946 when the revised edition of his *Language, Truth and Logic* appeared, both ATHEISM and AGNOSTICISM were "nonsensical," a quite remarkable view.

Since the end of the 1930s logical positivism has no longer existed as a distinctive movement, but many individuals have been inspired by the ideas of the logical positivists and have hearkened back to these sources for further inspiration.

Comte's rejection of traditional religion and metaphysics, his faith in science and progress, his theory of history, and his pioneering work in sociology have all had a strong and persistent influence on subsequent thought. Logical positivism can be seen as a movement which continued some of Comte's ideas in a more radical form. Comte's theory of history has fascinated many intellectuals but several of its elements have always remained disputed.

PRAGMATISM. In contemporary philosophy, *pragmatism* is used to characterize an array of positions and attitudes ranging from the hard-nosed naturalism of W. V. O. Quine to the economic reductionism of Richard Posner to the postmodernist relativism of Richard Rorty to the commonsense empiricism of Susan Haack. Rather than try to sort out the various senses of the term as it is employed in contemporary debates, I shall focus on the doctrines associated with the American philosophers most commonly credited with founding the pragmatist tradition: Charles Sanders Peirce, William James, and John DEWEY. The philosophical difference among these original pragmatists partly accounts for the variety of ways the term is understood today.

Peirce and the Pragmatic Maxim. The essence of Peirce's pragmatism lies in the principle of meaning, known as the pragmatic maxim, first expressed in his most famous essay, "How to Make Our Ideas Clear" (1878). However, this principle is itself derived from the theory of belief launched in his earlier article, "The Fixation of Belief" (1877). It is with this that we begin.

On traditional accounts, to have a belief is to be in a certain psychological state with regard to a given idea. That is, to believe that *snow is white* is to adopt a certain psychological attitude—one of affirmation—toward the statement "Snow is white." On this kind of analysis, belief is essentially a psychological phenomenon; beliefs are inner, mental, and private. Peirce sought to rid philosophy of the notion of an "inner" consciousness that it inherited from René DESCARTES. Wanting to set philosophy on more scientific ground, Peirce proposed a theory according to which beliefs are not essentially mental states, but rather *rules for action*, or as Peirce would say, "habits." On the Peircean analysis, to believe that *this knife is sharp* is to be disposed to *behave* in certain ways when presented with the knife. Put more generally, to have a belief is simply to have acquired a habit of acting in certain ways under certain conditions. As beliefs are, in essence, habits, they are not inner and private, but publicly observable.

How a particular belief will lead us to act is a function of the *meaning* of the idea or statement to which the belief refers. That is, the belief that *this knife is sharp* will generate certain behavior depending upon the meaning of the idea "This knife is sharp." Therefore, Peirce's theory of belief entails a theory of meaning. In "How to Make Our Ideas Clear," Peirce formulates his theory of meaning, which is often called the pragmatic maxim: "Consider what effects, that might conceivably have practical bearings, we conceive the object of our conception to have . . . our conception of these effects is the whole of our conception of the object."

The concept of meaning also has been traditionally understood to be primarily a psychological property. Here, again, we find Peirce resisting the traditional tendency; on Peirce's view, the meaning of an idea is to be analyzed in terms of the effects of its object in a person's experience. Accordingly, to say that some object *X* is hard is to say that it will scratch other objects. Meaning is therefore brought down to "what is tangible and conceivably practical"; the meaning of a term consists in the "sensible effects" it predicates of an object, and the meaning of a statement is essentially a proposal, or a prediction, regarding the functioning of its object. For any idea, then, one may extract its complete meaning by drawing out the proposals for action that it suggests. Meaning is thus taken out of the realm of private consciousness and placed into the world of action and behavior.

According to Peirce, the primary function of this conception of meaning is to help philosophers "dismiss" the "make-believes" of previous philosophizing. That is, the pragmatic maxim is to be used as a weapon against the imprecise and vague vocabulary of traditional philosophy, especially metaphysical philosophy. Peirce writes: "[Pragmatism] will serve to show that almost every proposition of ontological metaphysics is either meaningless gibberish—one word being defined by other words, and they by still others, without any real conception ever being reached—or else downright absurd."

Peirce imagined a time at which, through the application of his maxim, philosophy would be purged of all nonsense. At this time, all that would remain is "a series of problems capable of investigation by the observational methods of the true sciences."

James's Pragmatism. Unlike Peirce, who thought that pragmatism would expose the meaninglessness of metaphysics, James claims that pragmatism is "primarily a method of settling metaphysical disputes that otherwise might be interminable." Following Peirce, James locates the meaning of an idea within its practical consequences for behavior. However, whereas Peirce limits the practical consequences of an idea to those functional proposals which it predicates of its object, James designs his pragmatism to include within a given idea's pragmatic meaning its implications for the entirety of the believing subject's experience. That is, James realizes that belief in certain philosophical doctrines can be *paralyzing*, that certain philosophical doctrines can induce attitudes that *obstruct* action and literally stifle the flow of life. Such consequences, which may be characterized as "psychological," are certainly *practical*—they most definitely affect our behavior—and James thought that a practical philosophy must account for them. That is, Jamesian pragmatism "plunges forward into the river of experience" and attempts to confront it whole.

Accordingly, James does not follow Peirce in dismissing traditional philosophy's metaphysical disputes as only so much nonsense. The Jamesian strategy is to translate the competing metaphysical claims into propositions about our own attitudes and behavioral dispositions toward the world. Once cast in Jamesian-pragmatic terms, we shall find that either the competing claims mean the same thing (which is to say that they result in attitudes leading to the same kind of action), or that one frustrates while the other assists action. James argues that as ours is, for better or worse, a world that demands that we *act*; we should adopt those metaphysical propositions which facilitate action, support our efforts, and underwrite our deepest hopes. Hence one finds James *defending* a range of metaphysical doctrines—including certain religious claims—on pragmatic grounds.

Yet pragmatism is for James not only a method of dealing with metaphysics, but also "a certain theory of truth." James's pragmatic conception of truth is notoriously complex, and it has received more than its share of critical comment. I can offer only a sketch here.

Philosophers have long defended the intuitive idea that a statement is true just if it *corresponds* to reality. Decidedly philosophical difficulties arise once one is asked to specify precisely what the relation of "correspondence to reality" is. James's pragmatic theory of truth attempts to answer this question by applying the pragmatic maxim to the notion of correspondence. On James's analysis, the essential thing about truth "is the process of being guided" in action; "correspondence to the way the world is" and "agreement with reality" is "essentially an affair of leading." Hence to say that a statement is true is to say that, were one to believe it, one would be successfully led in action. A statement is true, then, insofar as it is a reliable (James often says "useful") guide for action. Thus the oft-cited but infrequently understood motto, "truth is what works."

Critics have charged James with making the truth of a statement depend upon our wishes, purposes, and desires. Although in some writings James invites this charge, the pragmatist theory of truth is not quite so crude. James retains Peirce's functionalist account of belief: The meaning of a belief is the habit of action it produces, and every meaningful belief thus has a *purpose* insofar as it is adopted for the sake of successful action. But action is not to be understood simply as an individual event, an isolated *doing*. Action occurs within a complex network of experience. For example, the act of taking a sip of coffee involves the coordination within experience of a wide variety of factors: My beliefs about the location of the cup and how it is to be grasped, the commonsense trust in the existence and general stability of medium-sized physical objects, and the workings of gravity and other physical forces, among others. Given that actions occur within the manifold of experience, it is perhaps more correct to think of a belief as a guide for *activity*. Now, the pragmatic conception of truth says that beliefs are to be evaluated according to their ability to guide activity; accordingly, beliefs "become true just in so far as they help us to get into satisfactory relation with

other parts of our experience." Hence the "usefulness" James associates with truth has to do with a belief's ability to guide action successfully *within* the whole of experience. Wish as I may that I had millions of dollars in my bank account, this belief could not reliably guide my action, and is therefore false. The "working" and "usefulness" that James associates with truth are not reducible to human whim or desire.

Dewey's Pragmatism. Dewey articulates a version of pragmatism that he called experimental naturalism. Dewey's philosophy is naturalist in that it takes as its fundamental category the Darwinian creature (see DARWINISM), a biological agent interacting with an environment. It is experimentalist in that it offers a conception of experience based in its naturalism. On Dewey's view, experience is not to be analyzed on the model offered by the traditional empiricisms of John LOCKE and David HUME, according to which experience is the passive receiving of impressions. For Dewey, experience is an "active affair primarily of doing," an "affair of the intercourse of a living being with its physical and social environment." As the relationship between a creature and its environment is a dynamic one of simultaneous and mutual doings and undergoings, experimentation is built into the very fabric of nature.

From this fundamental holism of agent and world, or of experience and nature, Dewey launches a devastating critique of traditional philosophies from PLATO to KANT and beyond. According to Dewey, all traditional philosophies presume a "spectator theory of knowledge"; that is, traditional philosophies presume that there is a *metaphysical* difference in kind between the knowing subject and the object known. Typically, this difference is analyzed in terms of an "inner" mind and an "external" reality. From this assumption, all the standard epistemological and metaphysical puzzles of philosophy grow. The familiar problems of skepticism, the existence of the external world, the validity of induction, and the relation of mind and body all arise from this fundamental dualism. On Dewey's view, the idea that the knowing subject is essentially a passive "spectator" looking on an external world of objects is exploded by the holistic Darwinian paradigm. According to Dewey, "[T]he interaction of organism and environment, resulting in some adaptation which secures utilization of the latter, is the primary fact." Once this is recognized, we see that knowledge is essentially a kind of *activity*; it is the activity of developing experimental hypotheses and testing and revising them in the course of experience.

Dewey is perhaps best known for drawing the implication from his experimentalist epistemology to a distinctive conception of politics. Dewey reasons that, as experience itself is bound up with processes of experimentation, and since knowledge itself is to be analyzed in terms of experimental confirmation and success, the most human and most just political order is that which best enables and supports human experience. Dewey held that democracy, understood as collective and participatory self-government, is the only political order in which the full potential of human experience can be realized. In this way, Dewey held that all social institutions, including schools, households, and workplaces, should be democratically ordered.

Dewey's rejection of the spectator theory of knowledge and his experimentalist alternative provides the core of a comprehensive philosophical system that ranges from epistemology and metaphysics to aesthetics, ethics, and political philosophy. We have here only scratched the surface of Dewey's pragmatism. Suffice it to say that Dewey's pragmatism is driven by an abiding insight that philosophical theorizing must begin from a fundamentally scientific understanding of life and experience, and must be directed toward the resolution of human problems.

Conclusion. To conclude, let us identify four broad themes prevalent in the pragmatist tradition. First, pragmatism is a kind of *NATURALISM*; that is, pragmatists reject philosophical appeals to supernatural entities or forces, and aspire to keep philosophical speculation within the bounds of respectable science. Second, pragmatism is a kind of *empiricism*; that is, pragmatists insist that philosophical concepts must be understood in terms of human experience. Third, pragmatism is a kind of *functionalism*; that is, pragmatists tend to emphasize *action* or *activity* in their philosophizing—they hold that to understand something is to understand *what it can do*. Finally, pragmatism is a kind of *HUMANISM*; that is, pragmatists insist upon the powers of free human intelligence and open inquiry to resolve the moral, political, and material problems we confront today.

PRAYER. Prayer is an aspect of religion that many unbelievers secretly regret abandoning, but most stories of its rediscovery on their deathbeds are clerical inventions (see DEATHBED CLAIMS CONCERNING UNBELIEVERS).

Befitting its paradoxical status, prayer is variously classified. The *Encyclopedia of Religion* (1987) identifies petition, invocation, thanksgiving (praise or adoration), dedication, supplication, intercession, confession, penitence, and benediction; the *New Encyclopaedia Britannica Macropaedia* (1974) identifies petition, confes-

sion, intercession, praise and thanksgiving, adoration, and unitative prayer (mystical union or ecstasy). Apart from the last, the Britannica's classification is more logical. While theologians endlessly romanticize about the psychological importance and lofty aspirations of prayer, the *Encyclopedia of Religion* concedes that addresses to the deity on personal and material matters, which it defines as petition, are "thought to be the most widespread and hence oldest type." "Supplication" is similar to "petition" in its essentially anthropocentric and selfish implications, but may be less material and usually seeks to advance the interests of a wider group—family, tribe, nation, or all humanity—of which the individual is a part.

The loosest definitions apply to "intercession." Strictly, it involves the use of mediators with a *locus standi* (official status) to put the cause of humankind before the deity. In Trinitarian Christianity, this means God the Son interceding with God the Father, as spelled out in 1 Timothy 2:5: "For there is one God, and one mediator between God and men, the man Christ Jesus." Jesus himself reportedly endorsed this role in "Father, forgive them; for they know not what they do" (Luke 23:34). The practice of invoking Jesus is commonly followed by evangelical Protestants, though the Holy Ghost or Spirit (Rom. 8:26) may also be called upon. Roman Catholics, on the other hand, usually seek the intercession of a particular saint associated with the desired boon and/or the Virgin Mary. Hence the rosary: "Holy Mary, Mother of God, pray for us sinners now and at the hour of our death." Bodhisattvas function similarly within Mahayana Buddhism. By extension, "intercession" has come to mean prayers by individuals or groups on behalf of other people and is even, as the *Oxford English Dictionary* concedes, "loosely used for a petition or pleading on one's own behalf." To combine petition, supplication, and intercession under "petitionary prayer" would seem logical.

However defined, this is what most concerns unbelievers in religious controversies; though freethinking moral philosophers are equally critical of the way confession and penitence are employed to advance clericalism (see ANTICLERICALISM) and undermine personal responsibility and reparation. All the other forms of prayer are generally deemed beyond polemics.

Public prayers are often a jumbled blend of categories. The following analysis may be made of the famous Lord's Prayer (Matt. 6:9–13) of Christians:

> Our Father, which art in heaven [*invocation*] hallowed be thy name [*praise*]. Thy kingdom come; thy will be done in earth, as it is in heaven [*invocation*]. Give us this day our daily bread [*petition*] and forgive us our trespasses [*confession/penitence*] as we forgive those who trespass against us [*intercession*]. Lead us not into temptation, but deliver us from evil [*supplication*]. For thine is the kingdom, and the power, and the glory, for ever and ever [*adoration*]. Amen [*dedication*].

Religious and philosophical objections to the concept of prayer, especially petitionary prayer, were well stated by clerics or former clerics in the nineteenth century. In *The Religion of the Universe* (1864) Robert Fellowes bluntly stated, "We anthropomorphize the Deity: we make a man, a frail, mutable, vacillating man of the Eternal." Christian Socialist F. D. Maurice said that while Trinitarianism "makes prayer possible" by invoking Jesus as a mediator, the idea of a Sole God in Unitarianism (see UNITARIANISM TO 1961) is inconsistent with the concept. "Is God's Will good? then why attempt to move it by petitions and intercessions? Is it not good? then how hopeless the effort must be, seeing that he is omnipotent." More diplomatically, *The Bible Reader's Encyclopedia and Concordance* (n.d.) admits, "One of the gravest obstacles in the way of believing that God answers prayer is that to do so would be to alter His own natural and moral laws, and hence to 'change His mind.'" Then in a bold sleight of hand it asserts that, according to Jesus, God's mind involves fellowship with humankind, whose real need is to find God, and that, as prayer satisfies both expectations, it is always answered.

Less ingenious but equally specious arguments claim to establish the same proposition. It is argued, for example, that through prayer the faithful discover what God's will for their lives really is and that, even though it may be different from what they originally sought, they come to terms with it, revise their expectations, and so find their prayers answered. Clearly this is not what average petitioners expect when they get down on their knees to pray for rain, a miracle cure of disease, or their nation's victory in warfare. Warfare in particular is a time when the deity is notably ear-bashed and put in an impossible position. For even if Yahweh, Allah, and the rest are not different names for the same supreme being, the Holy Trinity itself has often been enlisted in the cause of each rival Christian nation. As freethinking historian John Mackinnon ROBERTSON put it in his *History of Freethought in the Nineteenth Century* (1929), "Prayer implicates all the self-contradictions of theism."

Amid the various conceptions of prayer there are two characteristics that all authorities agree on. The communion of humankind with God (or other sacred entities) has already been considered. Universality is its other feature. Anthropologists dispute whether prayer is a simple evolution from the magical incantations found in animism, or represents an entirely separate phenomenon. In tribal cultures, prayer to the disembodied spirits of ancestors or spirits inherent in sacred objects like amulets or talismans may involve bribery or blackmail (offering or withholding sacrifices) or even intimidation (beating objects that fail to perform as expected). While all believers have always been considered capable of praying on their own behalf, in ancient pagan and later

religions priestly castes have arisen with formalized and formularized praying functions, though their sacramental role is more important. In Islam dervishes, or mystics, are deemed to have special nonpriestly powers.

In Orthodox Judaism, following the Torah and lives of the patriarchs, demonstrable piety, as in public praying, is held to bring material benefits. In the Judaism of the prophets and in early Christianity, this supposed benefit of religion is subordinated to otherworldly considerations. But religious materialism could not be easily eradicated, and particularly in Christian Science, Mormonism, and latter-day cults, prosperity in this life is advertised as a benefit of prayer.

If prayer brought only so-called spiritual benefits, unbelievers would have no means of explaining, measuring, or refuting them. It is a different story when psychological and/or material consequences are said to flow. Here one may apply both the verification and the falsification principles (see FALSIFIABILITY; VERIFICATIONISM; LOGICAL POSITIVISM). With private prayer, only believers know the objective and outcome of their prayers. If they claim their prayers are answered, surely that is verification. Maybe; yet it must be recognized they may well have a vested interest, professional or emotional, in making such a claim. But not only is it impossible to deny—as distinct from explaining—particular veridical (anecdotal) experiences, the sophisticated apologetics outlined above makes clear there is never a way to deny *any* claim for answered private prayer. Whatever results can be said to be God's will. Thus the claim fails the falsification principle's test and is either false or meaningless.

Sometimes a distraught petitioner does seem to display psychological improvement after praying. Is this a manifestation of divine intervention or any other type of supernatural force? That might be the case only if no other procedure were capable of producing the same effect. In fact, many such procedures exist. In the late nineteenth and early twentieth centuries, great store was placed on autosuggestion, associated with Émile Coué. By simply encouraging his patients to frequently repeat "Every day, and in every way, I am becoming better and better," this French pharmacist-turned-psychotherapist claimed, perhaps justifiably, to have effected improvements and even cures.

Not only may such widespread and imperfectly understood mental conditions as depression and anxiety states respond to psychological stimuli, but so may a number of physical diseases called psychosomatic. These displays of "mind over matter" perhaps associated with physical factors include hypertension (high blood pressure), respiratory and gastrointestinal disorders like asthma and chronic gastritis, migraine, impotence, frigidity, and dermatitis. Even certain cancers and diabetes are said to have a psychosomatic element. Today Coué is virtually replaced by a cocktail of drugs and cognitive behavioral therapy.

Not surprisingly, apart from wars and natural disasters, petitionary prayer flourishes in times of sickness and bereavement. Shamans who lead prayers are also called witch doctors or medicine men, and priests in many old religions were said to have healing powers (see FAITH HEALING). Apart from the psychosomatic illnesses listed above, there are a number of progressive conditions, such as multiple sclerosis and rheumatoid arthritis, that from time to time display spontaneous remissions that kindle hope in their victims. When these remissions occur during times of prayer or the laying on of hands by faith healers, messages transmitted by Spiritualist mediums, blessings by gypsies, immersion in healing springs, taking orthodox or quack medicines, hypnosis, acupuncture, aromatherapy—the list is all but endless—the lucky intervention is hailed as a miracle cure. But never is there an incontestable demonstration of prayer's power—say, the regrowth of an amputated limb. Remissions of this sort are part of the broader phenomenon of coincidence on which not only proponents of healing prayer, but astrologers, tarot card and teacup readers, stock market and racing tipsters, parapsychologists and fortune-tellers, depend. Some of their forecasts are bound to come true, be paraded by their givers, and remembered by their receivers. The rest are quietly buried. Nobody does a statistical analysis.

Even less often than with claims for the paranormal can scientific researchers persuade the faithful to submit the purported efficacy of prayer to rigorous investigation (see PARANORMAL, BELIEF IN THE). Where investigations do occur, they are often conducted by believers in the phenomenon being studied. While such people may be consciously honest, they have an unconscious urge to turn a blind eye to dishonesty in their subjects or irregularities in the procedure, and to select favorable results as valid and reject unfavorable ones as flawed.

If the investigators are dishonest they will try to bamboozle any observers present or, if they find this impossible, excuse unfavorable results or truncate the experiment on the grounds of disabling "negativity" or "bad vibes" produced by SKEPTICISM.

Even when properly conducted, at best such investigations turn out not to provide a 100 percent occurrence of answered prayers, telepathy, precognition, or whatever, but a result "beyond chance expectation." But every research finding has a standard deviation about the mean, and an unusual result need not be significant unless found in a sufficient number of similar experiments. A one-off trial, however impressive, has no statistical value.

All the above reservations apply to a much-touted and, at first glance, imposing investigation conducted at prestigious Columbia University Medical Center and critically reported on by Bruce Flamm. The Columbia study purported to show that "infertile women who were prayed for by Christian prayer groups became pregnant twice as often as those who did not have people praying for them." The study was published in the (normally

peer-reviewed) *Journal of Reproductive Medicine* in 2001, and was immediately reported on around the world. Not only was the sponsoring institution highly reputable, but the lead author was chairman of its Department of Obstetrics and Gynecology. The study involved 199 infertility patients in Seoul, South Korea, 100 of whom received in vitro fertilization (IVF) plus prayer from Christian prayer groups in the United States, Canada, and Australia, and the control group of 99 patients received just IVF. Neither group knew of the experiment. The pregnancy rate for the first was 50 percent, for the second, 26.

Perusal of the findings revealed a complex and unsatisfactory operation of the groups of persons performing the praying, who were divided into tiers, blocks, and units. Some prayed for fertilization, some "that God's will or desire be fulfilled in the life of the patient," and some for other praying blocks. No reason was given for this complexity. Further, "[t]he authors made no attempt to discover how much prayer was being conducted outside the study protocol, perhaps to other gods, since only one-third of Koreans are Christians." Equally unsatisfactory was reportage of the findings.

One of the study's three authors at the time was director of the Columbia Infertility Medical Center, "but apparently severed his relationship with Columbia soon after the study was published." Subsequently, the ostensible lead author claimed he first learned of the study six to twelve months after it was completed, and "primarily provided editorial review and assistance with publication." The third author, previously unknown at Columbia, turned out on investigation to have a checkered past and a number of aliases. Known as a doctor and head of an organization called Healing Sciences Research International, he has no medical qualifications and his previous research involved "studies on mysterious supernatural or paranormal phenomena, mainly dealing with alternative and spiritual healing." His specialty has been noncontact therapeutic touch, where the healer "scans" and "rebalances" the "human energy fields" of patients; but he has also evaluated patients of a spiritual healer trained in the Philippines *Espiritista* system of faith healing, which includes "psychic surgery," laying on of hands, and distant prayer healing. Apparently these professional engagements were insufficiently lucrative for the Columbia researcher, for in 2004 he was convicted of conspiracy to commit mail fraud and bank fraud involving "more than $3.4 million in income and property obtained by using false identities."

Flamm reminds us: "It must be emphasized that, in the entire history of modern science, no claim of any type of supernatural phenomena has ever been replicated under strictly controlled conditions." Faced with the above exposé, the *Journal of Reproductive Medicine* removed the Columbia prayer study from its Web site, but the damage had been done. Faith healers across America continued to quote it as vindicating intercessory prayer. While some may consider such ministrations harmless and possibly helpful to the gullible, the real danger is that while these charades are proceeding, any underlying pathology is left untreated by proper medical intervention.

PROJECTION THEORY. In psychoanalytical literature, projection theory attempts to explain how and why the phenomenon occurs in which a person attributes to (projects onto) another object or person attitudes or characteristics of oneself. In theories of religion, it is an attempt to explain how and why the gods are the objectification of some aspect of human nature or human nature as a whole. Although the idea goes back to ancient times, it was not until the nineteenth century that Ludwig FEUERBACH constructed a theory of religion based on projection. He argued that gods arise when, in the process of the self-differentiation of the I from the thou, the I realizes it is a member of a species. The imagination then seizes upon the ideal predicates of the species, strips them of their limitations, and unifies them in the notion of a divine individual subject for whom human beings are objects. In the last century, the intellectual disciplines of anthropology, psychology, and sociology have cast up a variety of influential theories of religion in which the concept of projection is at the core: in anthropology, Weston La Barre, Ernest Becker, Melford Spiro, and Anthony Wallace; in psychology, Sigmund FREUD, Carl Jung, Erich FROMM, and Ana-Marie Rizzuto; in sociology, Peter Berger, Emile Durkheim, and Guy Swanson, to mention a few.

The sheer variety of such theories should caution us against easy generalization. Not only is projection conceived differently in the various theories, but it yields quite different interpretations of religion. Insofar as

"projection" is a technical term, it acquires its meaning from the theoretical context in which it occurs.

The phenomenon of projection tends to be conceived in two different ways. In the first, projection is conceived as an objectification of the self or one of its aspects. In the second, projection refers more broadly to the framework used to interpret experience. The first conception lends itself to metaphors taken from the cinema or, as in the nineteenth century, from the magic lantern. Images taken from the self are said to be projected onto the screen of nature; hence the shorthand reference to "beam" theory. The second conception lends itself to metaphors taken from templates, schemata, and grids; hence the shorthand reference to "grid" theories.

Beam theories of religion tend to contain four closely related ideas. (1) An essential aspect of religion is belief in supernatural, anthropomorphic beings. (2) The projections must themselves be explained by psychic processes of some kind—the relationships between the instincts, as in the case of Freud, or the archetypes in the collective unconscious, as in the case of Carl Jung. (3) There is a close conceptual relationship between the theory of the psychic processes and the principles used to interpret the religious symbolism. Thus, Jung interprets the idea of God in terms of the functions of the archetype of the Self. (4) The theory of the self which informs the theory of projection provides the criteria for the judgment whether the religious projection is an illusion and whether or not it should be considered pathological or healthy. It is an interesting aspect of some object-relations psychological theory that it regards some religious projections as "transitional objects" similar to teddy bears and hence as equally healthy. For Freud, by contrast, the religious illusion is infantile, whereas Jung argued that the psychologist has no competence to judge the truth of the religious projection. Jung's concern was whether the religious archetype integrates the self or not.

The second (grid) type of projection theory is based on the view that human beings construct conceptual and symbolic frameworks by means of which they categorize and coordinate their ordinary experience. These frameworks mold the consciousness of individuals and provide the basis for self-identity. The use of the term *projection* in this extended sense makes use of linguistic associations inherent in the verb *to project*, such as *to cast* or *to throw*. Some philosophers have argued that since these frameworks reflect instrumental purposes, they may be viewed as projections. Insofar as a religion provides a worldview or symbolic framework by means of which people orient themselves, then it may be conceived of as a projection in this sense.

When the term *projection* is used in this fashion, we can understand why grid theorists do not necessarily define religion as a type of anthropomorphism, and hence necessarily false. They tend to view religion as a sacred worldview whether there are anthropomorphic deities involved or not. Moreover, grid theorists tend to distrust appeals to theories of the self that are characteristic of beam theorists. The grid theorist is primarily interested in the social and cultural institutions over which religion has thrown a "sacred canopy."

Grid theories may be conceived of in many different ways: perceptual, categorical, cultural, and metaphysical. The Dutch anthropologist Fokke Sierksma, for example, has argued that religious projection needs to be seen in the context of perception itself, which he regards as a type of projection. All perception, he argues, is species specific. Every species relates to the world through a unique noetic apparatus that is necessarily selective. Any given species responds to only a few of the stimuli emanating from the world. Consequently, there is much that escapes the human perceptual grid. The human creature that possesses self-consciousness is dimly aware that that there is a reverse side of things, so to speak, that escapes what we perceive. Although not everyone subjectivizes this unknown surplus, there are others who become preoccupied with it, because it is this ungraspable reality that gives humans the feeling that they are no longer at home in their stabilized world. The distinctiveness of Buddhism, Sierksma argues, is that it relates projection to perception and has developed a religious practice devoted to revoking projection and perception. It criticizes all forms of objectification (projection) and even the notion of the self.

VAN A. HARVEY

PROPAGANDA, ANTIRELIGIOUS (CUBAN). Shortly after the 1959 Cuban Revolution, all those opposed to the new Marxist regime, whether Catholic or Protestant, faced expulsion. While they remained in Cuba, they were denied the opportunity to run schools, which cut deeply into the churches' financial resources. Also, church properties were nationalized and the religious bodies' private media (including newspapers, radio, and television programs) were discontinued. Church members were routinely watched by the government. Many bishops, priests, and ministers were placed under house arrest. Christians were denied membership in the Communist Party, an important channel for economic advancement, and were declined admittance to high-level government and university positions. Many, mostly in the white middle class, chose to flee to Miami rather than stay and fight the regime. This exodus drained the island of educated entrepreneurial talent and further weakened the churches' power base. From 1965 through 1968, thousands of artists, hippies, university students, intellectuals, and homosexuals were abducted by the State Secret Police and interned without trial in the Military Units for Assistance to Production (UMAP) reeducation labor camps. Also interned were Jehovah's Witnesses, Gideonists, and Catholic or Protestant activists. An era of "internal exile" began.

After several decades, tension between the church and government subsided. The church ceased to challenge Fidel Castro's authority, gaining some governmental tolerance for religion. The Catholic Church in particular began to reconcile with Castro's regime under the leadership of Cesare Zacchi, the Vatican emissary appointed in 1962. He praised Castro's social reforms, criticized prerevolutionary Cuba, and admonished clergy who had abandoned the island after the revolution. On April 10, 1969, a decisive break with the past occurred when the Catholic Church published a letter authored by Cuba's bishops denouncing the US embargo of the island. For the first time, the Catholic Church had committed itself to work for the development of Cuba without condemning the ideology of the regime.

Protestants also sought a rapprochement with the Cuban government. In 1977 the Confession of Faith of the Presbyterian-Reformed church in Cuba declared, "The Church lives joyfully in the midst of the socialist revolution." Castro reciprocated by giving a televised speech from the pulpit of a Protestant church flanked by church leaders during the 1984 visit to Cuba by US Baptist minister and political figure Jesse Jackson. Additionally, the 1985 publication of Castro's best seller, *Fidel y la religión* (Fidel and Religion), began a public dialogue concerning areas of cooperation between Marxists and what Castro called "honest" Christians.

Castro sought this strategic alliance by establishing Christian-Marxist dialogues. He was influenced by priests such as Camilio Torres, who had in 1966 ceased to celebrate Mass in Columbia so as to promote its revolution. The 1979 success of the Sandinista revolution in Nicaragua furthered affected Castro's attitudes toward religion. Several Catholic priests and Protestant leaders, motivated by their religious convictions, had distinguished themselves in Castro's eyes by taking part in the struggle against Nicaragua's corrupt president Anastasio Somoza and by assuming important governmental positions in the new Nicaraguan regime.

Because the Cuban Revolution had preceded the liberalizing reforms of the Second Vatican Council, the theological trajectory followed by Catholicism in Cuba differed from that taken elsewhere in Latin America. Although Cuban representatives participated in Vatican II and in the 1968 Medellín reunion of Latin American bishops, Cuba developed its own form of theological thought. "Theology in revolution" became a homegrown means by which some Cubans began to understand their faith. Unlike the liberation theologians of Latin America who read their experience through the lens of the biblical book of Exodus—in which a liberating God guides God's people toward the promised land—Cuban theologians such as Israel Batista maintained that Cubans are liberated and already live in the promised land. Consequently, the task facing Cubans is not liberation, but constructing and building society. Such a pragmatic interpretation required a "prophetic reading," providing the people with the necessary praxis (practical application of theory to real life) to develop a revolutionary society. "Prophetic" in this case implied not the right to criticize the revolution, but rather the obligation to break open the sacred space occupied by theologians so that they can come into step with the people. Other Cuban theologians such as Sergio Arce Martínez made it clear that when Christians reflect theologically on the revolution, they do not do it for the benefit of revolutionaries, or to provide a service to the revolution. Rather, reflection is done for Christians and the church so that they can render a service to both revolutionaries and the revolution. He insists that Christians do not speak for the revolution, which is not Christian; instead they speak for the Christian revolutionary who plays an active part in Christ's church located within a socialist country, as well as for their socialist homeland, in where a Christian church exists.

Yet liberation theologians such as Gustavo Gutiérrez expressed concern that theologies steeped in revolution have the tendency to "baptize" the revolution by placing it beyond criticism. Castro's well-known phrase, "Everything within the revolution, nothing outside of the revolution," fixes limits of acceptability upon all discourse, including Christianity. Gutiérrez accuses the theologies of revolution of "reductionism," of reducing the gospel to sociology, economics, or politics. Faith becomes a justification for Christians to participate as

actors in achieving the goals of the revolution. Similarly, Clodovias Boff states that the overall process of revolution tends to be confused with just one of its moments, the moment of breakage, of rebellion. Revolutionary immediatism fails to recognize that the ultimate goal of social change is a long-term historical process, not an immediate call to arms. Fulfilling basic needs is not the end, but the means to a full realization of humanity.

Antireligious propaganda is no longer seen in Cuba. In Cuba today there is the freedom to proclaim one's faith, but there is still no freedom to question or challenge governmental authorities based on the tenets of that faith.

MIGUEL A. DE LA TORRE

PROPAGANDA, ANTIRELIGIOUS (SOVIET). From the 1917 revolution until its fall from power in late 1991, the Communist Party of the Soviet Union promoted the longest sustained antireligious campaign in history. It developed a wide range of antireligious propaganda techniques, many of which were later emulated by other socialist regimes.

Antireligious Legislation and the Need for Propaganda Campaigns. As Marxists (see MARXISM), the Soviet Communists viewed religion as a product of the socioeconomic system of feudal and capitalist exploitation, doomed to "wither away" as socialism built a nonexploitative, classless society. Initially, then, many believed religion would simply die out after the 1917 revolution. In January 1918 a decree "On the Separation of Church and State" expropriated all ecclesiastical land and property without compensation, stripped religious organizations of their juridical status, and banned religious instruction in schools. Later in the summer, the Constitution of 1918 formally provided for religious freedom and established the "right to conduct religious and atheist propaganda." But religion did not crumble, even though its economic base had been removed. And the state was not neutral to religion, for the Communists' goal was to achieve a society that was not merely secular, but enthusiastically atheist. They soon realized that more concerted measures would be needed to replace the worship of God with devotion to the revolutionary state and its ideals. Thus, from the first years of Soviet power, a campaign to promote the rejection of religion and the adoption of an atheist worldview accompanied legal strictures on religious activity. The main target was the Russian Orthodox Church, the former state religion, but policies also addressed minority faiths such as Islam, Judaism, Catholicism, Protestantism, Buddhism, and the various religious sects.

Antireligious policy throughout the Soviet period had both propaganda and police-administrative, at times violent, components. Tension between these two approaches arose, since Communist policymakers recognized both a need to consolidate political power among ordinary people who might be offended by antireligious measures, and the goal of eliminating competing centers of social and ideological power in Soviet society.

Early Antireligious Propaganda. The Communist Party program for 1919 called for broad antireligious propaganda, but provided little guidance about what that propaganda would look like. As a result, early Soviet antireligious measures were rather haphazard. Certain policies aimed at scientifically debunking particular cherished beliefs. The most controversial of these was the opening of the coffins of saints in order to show that, contrary to the belief of the Orthodox faithful, the bodies of the saints had decomposed. Among the most popular measures were antireligious debates, in which Communist lecturers challenged members of the clergy. These were discontinued in the mid-1920s, however, for fear of providing as much of a platform for religious as for antireligious voices. Also attention getting were the Young Communist League's anti-Christmas and anti-Easter carnivals, which involved often rowdy parades and stunts such as mock trials of gods.

The League of the Godless. The year 1923 saw a shift to a systematic program of antireligious agitation as

part of the campaign to build a socialist society and the perceived need to be more vigilant about ideological matters in the context of the New Economic Policy's relaxation of economic controls. This new attention was symbolized by the founding in late 1922 of the Party Central Committee's Commission for Implementing the Separation of Church and State, charged with formulating and overseeing policies to destroy religious organizations and promote ATHEISM. One of its first moves was to ask the party's Agitation and Propaganda department to create an antireligious newspaper, *Bezbozhnik* (Godless). In 1924 its editor, Emel'ian IAROSLAVSKII, organized a Society of Friends of the Newspaper *Bezbozhnik*. At a congress in April 1925, that group became the All-Union League of the Godless. The league was a mass voluntary organization dedicated to promoting antireligious views. Under the leadership of the party, its local cells sold *Bezbozhnik* and other league publications and organized lectures, discussions, reading circles, museum tours, demonstrations, and other activities. In 1929, during the Cultural Revolution that accompanied the onset of Stalinist industrialization, it was renamed the League of the Militant Godless. By 1932 it boasted 5.5 million members. Although not formally disbanded until 1947, in practice the league disappeared in mid-1941 after the German attack on the Soviet Union. During the war, antireligious propaganda was largely muted and the Orthodox Church's public position was partly restored.

Propaganda Techniques. The regime employed a variety of means to convey its atheist message. The most important was print propaganda. The weekly newspaper, *Bezbozhnik*, was joined, in the 1920s and 1930s, by other Russian-language periodicals, such as *Antireligioznik* (Antireligious Activist), *Derevenskii bezbozhnik* (Village Godless), *Bezbozhnik u stanka* (Godless at the Workbench), and a wide array of similar journals in the languages of the various national minorities of the USSR. The league also published numerous pamphlets and mass-circulation textbooks for antireligious activists and the general population. Materials aimed at a general audience featured articles on science, on religious history, and on the benefits of the new Communist life the regime was building, alongside a lively variety of verse, fiction, cartoons, and reports from local correspondents ridiculing the clergy and various religious practices.

In the face of still-high levels of illiteracy in the 1920s, visual and audio forms of propaganda also played an important role. Posters depicted religion standing in the way of education, women's liberation, industrialization, and an enlightened new Soviet lifestyle. Films, newsreels, and league-sponsored radio broadcasts mocked religious activities and reported the arrest of religious leaders and activists for various counterrevolutionary activities. A central antireligious museum opened in Moscow, and local league councils created similar museums in former churches, synagogues, and mosques, or installed antireligious displays at local history museums. Where once religious icons had adorned corners in public places such as factory workshops and dormitories, activists sought to replace them with godless or Lenin corners.

Antireligious propaganda also focused on debunking religious holidays and substituting Soviet holidays and rituals for them. At Christmas or Easter—or Passover or Ramadan—the number of antireligious events spiked, with lectures and demonstrations organized to conflict with religious observances. Articles in the press debunked the basis for the holidays and reported on the decline of observance of them. Simultaneously, citizens were encouraged to celebrate a range of revolutionary festivals, from May Day (close to Orthodox Easter) to a new Harvest Day designed to replace the traditional Orthodox *Pokrov* holiday in October. In the 1930s New Year's emerged as the great family winter holiday, complete with decorated trees and visits from Grandfather Frost. *Bezbozhnik* printed numerous stories about new Soviet secular rituals, including "Octobering" ceremonies to name a new baby and "red" weddings and funerals.

Scientific Atheism. The successor to the League of the Militant Godless was the All-Union Society for the Dissemination of Political and Scientific Knowledge (known after 1963 simply as the Knowledge Society). It was founded in 1947 as a mass scientific and educational voluntary organization. At first, it showed little interest in antireligious propaganda, although most branches of the society had a section dealing with scientific atheism. Only in 1959, when the party under Nikita Khrushchev launched a fierce new attack on religion, did it begin vigorous work in this field. Eschewing much of the ridicule and carnival aspects of the prewar period, the society's approach emphasized the intellectual component of antireligious work, in particular refuting religious beliefs and replacing them with an atheist, scientific worldview and Communist morality. In 1960 it launched the journal *Nauka i religiia* (Science and Religion).

This intellectual emphasis prompted the creation of a new field of scholarly activity, scientific atheism. In 1964 an Institute of Scientific Atheism was established in the Academy of Social Sciences of the Party Central Committee. It concentrated on concrete, mostly sociological, research and on assisting atheist activists rather than conducting propaganda itself. Around the same time, a required course on scientific atheism was introduced for all students in universities, as well as in medical, agricultural, and pedagogical institutes.

On the more popular level, in the late 1950s "atheism clubs" and "houses of atheism" were established. Working under the guidance of the party and in cooperation with the Knowledge Society, they organized libraries and reading rooms, held lectures, showed films, and provided training programs. Schools and other groups toured the Museum of the History of Religion and Atheism in the former Kazan Cathedral in Leningrad, which welcomed half a million visitors in 1960 alone.

Effectiveness and Challenges Faced. For seventy years, Soviet antireligious propagandists consistently faced the same difficulty: it was one thing to challenge religious belief and practice but quite another to get people excited about atheism. By the 1980s, nine out of ten Russians were not raised in the Orthodox Church and three-quarters did not believe in God. The Soviet population thus exhibited high levels of passive irreligiousness, but this did not necessarily translate into militant atheism. Indeed, it was not clear to what extent the Party's propaganda efforts were responsible for this situation, or whether they reflected the broader secularizing effects of the modernization and social displacement that the Soviet era witnessed. Moreover, in the late Soviet period, a revival of interest in religion suggested that this irreligiousness was reversible. A survey of religious views taken in 1991 as the USSR was collapsing found that half the population professed belief in God and 22 percent reported that they had once been atheists but now believed.

HEATHER J. COLEMAN

PROTAGORAS (5th century BCE). Greek Sophist. The Sophists were professional teachers who trained students for life in a democratic and litigious society. Protagoras of Abdera, one of the earliest and most influential sophists, is known primarily for his subjectivism and for his AGNOSTICISM. The precise years of his birth and death are unclear, with estimates ranging from 490 to 481 BCE for his birth and from 420 to 411 BCE for his death. He traveled widely and observed a variety of cultures, and by the middle of the fifth century had established himself as a professional teacher in Athens. His status as a rhetorician and teacher was such that Plato named a dialogue after him, and he either appears or is referenced in a number of other Platonic dialogues as well. Despite fundamental differences in philosophy, Plato treats him and his doctrines with sufficient respect to serve as a significant and reliable source of information on Protagoras. Unfortunately, very little of his own work survives, and much of what is known about him comes from the writings of Plato, Diogenes Laertius, Sextus EMPIRICUS, and others.

Subjectivism. "Man is the measure of all things, of the things that are that they are, and of the things that are not that they are not." Protagoras is probably most famous for this quotation and the subjectivism it reveals. According to this doctrine truth is relative to the observer, and what is true or useful or good to me may be very different from what is true or useful or good to you. He also seems to have defended the claim that, as any claim of truth is necessarily a claim about appearances, it is impossible to speak falsely, and that it is possible for an opinion to be true and false at the same time. He is credited with being the first to teach that there are two sides to every argument, and claimed to be able to make the weaker argument defeat the stronger. This concern for what was persuasive rather than for what was "true" served him well in his preparation of students for trial, but it also helped generate the suspicion that increasingly surrounded the sophists.

Agnosticism. In light of his subjectivism concerning truth, it should come as no surprise that Protagoras thought suspension of judgment to be the appropriate course regarding the gods. Plato's *Thaetetus* attributes to Protagoras a refusal to even discuss the question of the existence of the gods. Protagoras's own work *On the Gods* begins with the claim that the obscurity of the subject and the shortness of human life prevents him from being able to discover anything about the form of the gods, or even if they exist. Protagoras's subjectivism was based on the idea that that which appears to me to be true is true, and thus "truth" lies only in appearances. Agnosticism would come naturally to those that live only by appearances. As a central component of Protagoras's view is a denial of the possibility of objective knowledge regarding even those objects that present themselves to our senses, it is easy to understand why he would refuse to make dogmatic claims about those matters for which we had not even the suspect evidence of our senses. A disputed account by Diogenes Laertius contends that it was Protagoras's commitment to agnosticism that eventually led to the seizure and burning of his works and his banishment from Athens.

JASON GRINNELL

PROUDHON, PIERRE-JOSEPH (1809–1865), French philosopher and anarchist. Pierre-Joseph Proudhon was born on January 15, 1809, in Mouillère, a suburb of Besançon in eastern France. Pierre's father, Claude-François, was a journeyman brewer and his mother, Catharine, a servant. He was the eldest of five children.

Pierre's mother taught him to read at a very early age; however, as the family was fairly religious the only books available to him were Bibles and almanacs. When Pierre was eleven, his mother insisted that he study more broadly. The family had no money for books, so Pierre spent all his free time in the library.

As a boy Proudhon had little use for the religious rituals his family practiced, and he began to question the religious dogma of his teachers in his midteens.

Although forced to leave school and choose a trade, Proudhon continued his studies on his own and secured employment in a printing office in Besançon. In 1829, while working as a proofreader for the publisher Antoine Gautier, he was given the task of proofreading a new edition of *Lives of the Saints* in Latin. He so impressed the editor, Gustave Fallot, with his Latin skills that Fallot insisted on meeting Proudhon. Fallot wrote Proudhon a long letter in 1831, predicting his future success as a great philosopher. The two became close friends.

Dedicated to helping Proudhon find a way to continue his studies, Fallot offered him a place to live and study in Paris, which Proudhon accepted until Fallot contracted cholera and was no longer able to provide such luxuries. When Proudhon's younger brother Jean-Etienne was conscripted, Pierre was obliged to return to Besançon to help his family. He took a job as editor of *L'Impartial*, but upon being told that the censor would have to authorize his articles before they were printed, he quit. In 1833 Jean-Etienne died during military training, and this event radicalized Proudhon even more, instilling in him a profound disdain for the state.

In the mid-1830s Proudhon became foreman of the church history and theology publisher Gautier & Co., correcting the proofs of religious texts. He taught himself Hebrew in order to be able to compare the original texts with the Latin. This experience led him to the study of comparative philology. He later used the skills gained as a printer and editor of religious texts in arguments against the church and on the nature of belief. Authority in any form became the main target of his criticism.

Proudhon's first book, *Qu'est-ce que le propríeté* (What Is Property? 1840), was critically acclaimed by many, including his ideological adversary Karl MARX. In his *Système de contradicions économique ou philosophie de la misère* (The System of Economic Contradictions), published in two volumes in 1846, Proudhon explored the entire economic basis of contemporary society, including Providence, in which he refuted both VOLTAIRE's and Jean-Jacques ROUSSEAU's arguments about the existence of God as illogical. Although his denunciation of God and religion was quite severe, he suffered neither censorship nor prosecution until the publication of several newspapers critical of Bonaparte during the 1848 revolution. Proudhon served three years in prison.

In 1849 Proudhon married Euphrasie Piégard in a civil ceremony, although she was a devout Catholic and remained so throughout her life. They had four daughters, two of whom did not survive their father. On his deathbed, Proudhon refused the visit of a priest and instead said to his wife, "I shall confess to you."

JULIE HERRADA

PUTNAM, SAMUEL PORTER (1838–1896), American freethinker. Born in Chichester, New Hampshire, on July 23, 1838, the son of a Congregational minister, Samuel Porter Putnam entered Dartmouth College in 1858. Three years later he enlisted in the Union army as a private and saw Civil War action in the Shenandoah Valley and several theaters along the Gulf of Mexico. In 1864 Putnam, by now the captain of a company of black soldiers, had a religious conversion and resigned from the army to pursue a career as a minister. After three years of study at the Chicago Theological Seminary, Putnam worked as a Congregationalist preacher. But his stay with religious orthodoxy was brief. In 1871 Putnam joined the Unitarians (see UNITARIANISM TO 1961), but even this move could not keep pace with his ever more radical religious views. Within a

few years he left the Unitarians and turned to organized FREETHOUGHT. Putnam's radicalization also helped destroy his eighteen-year marriage to Louise Howell, which ended in 1885 on the ground of "religious and temperamental differences."

Putnam's link to organized Freethought was cemented during a celebrated case in 1879 when D. M. BENNETT, editor of *THE TRUTH SEEKER*, was imprisoned for thirteen months under the infamous Comstock laws for supposedly passing blasphemous material through the postal system (see COMSTOCK, ANTHONY, AND UNBELIEF). After securing a position as a clerk in the New York Custom House in July 1880, Putnam began his career as a freethought lecturer. For the next sixteen years, Putnam traveled throughout the United States, lecturing in all but four states of the union. He estimated that he traveled one hundred thousand miles during his lecturing career. In the summer of 1895 Putnam made a successful lecture tour of Great Britain.

In 1888 Putnam went with his friend George E. MACDONALD to San Francisco, where they founded the journal *Freethought*. It was funded largely by Putnam's tireless traveling and lecturing. The Depression of the 1890s caught up with *Freethought*, which folded in 1891. Back in New York in 1892, Putnam turned to the question of freethought organization. At a meeting he called in Chicago on September 4, 1892, Putnam formed the Freethought Federation of America, with himself as president. It was Putnam's goal to create an effective political voice for freethought. Putnam remained president of this organization until his death.

In 1895 the Freethought Federation combined with the AMERICAN SECULAR UNION to form the American Secular Union and Freethought Federation. Putnam's greatest political success was his efforts to defeat a proposal in 1896 to alter the US Constitution by inserting mention of God. Putnam's speech before the Joint Judiciary Committee of the US House of Representatives on March 11 helped kill the bill, a fact acknowledged by his Christian opponents.

Putnam also found time to write poetry and articles, but his most sustained work was *Four Hundred Years of Freethought* (1894), a massive work published to coincide with the four hundredth anniversary of the discovery of America. The title notwithstanding, the book was really a celebration of freethought as it stood at that time.

Putnam died on December 11, 1896, in mysterious circumstances. He, along with an attractive twenty-year-old protégé, May Collins, were both found dead in her hotel room in Boston. Putnam had been waiting for Collins in order to accompany her out to the theater when they were "poisoned by illuminating gas." Putnam's friend George Macdonald hastened to add that the "bodies of both, dressed for the street, were found on the floor."

BILL COOKE

PYTHAGORAS (ca. 582–ca. 507 BCE), Greek mathematician and philosopher. An Ionian Greek said to have been born on the island of Samos, Pythagoras fell foul of Polycrates, the tyrant who ruled the Samians, and fled to Crotona in Southern Italy, where he founded a secret society. Not much is known about the real Pythagoras, famous for the Pythagorean theorem in geometry and credited with coining the word *philosopher* (meaning "a lover of wisdom"). Legend states that his friends were so amazed by his intellectual talents that they spread the rumor that he must be a god disguised as a human. No doubt flattered by such a claim, he reassured them of his humanity through strict logic: The gods, by definition, know everything; he, Pythagoras, was always seeking knowledge. Therefore, he could not be a god. He was, instead, a lover of wisdom.

The earliest known references to Pythagoras date to the time of PLATO, two hundred years later, and he remains a mysterious figure in the history of thought. A movement grew up dedicated to his teachings, which included the view that numbers constitute true reality (which influenced Plato's conception of the forms). Connected with this was the doctrine of the transmigration of souls; followers of Pythagoras apparently believed that souls, before attaching themselves to a corporeal form, resided inside beans, waiting to be consumed by a pregnant woman in order to enter the fetus within. Thus, one of the strongest admonitions of the Pythagoreans was that men not eat beans, one of the stranger dietary laws associated with an organized religion. Consumption of meat was also frowned upon, as such carcasses might once have held the souls of one's friends or ancestors.

For freethinkers Pythagoras has also come to symbolize one who questioned the existence of the gods, at least as generally understood at the time, and also one who explored the relationship of human beings to the cosmos. For the Pythagoreans, philosophy involved using reason and observation to gain understanding of the universe. The order of the cosmos should be mirrored in the order of the human soul. The search for underlying principles led Pythagoreans to believe that numbers, unchanging and perfect, must be the basic reality of the universe. Related to this, Pythagoreans discovered that musical harmony is based upon mathematical proportions (the credit for this being given to Pythagoras himself, who was enchanted by the clanging of a blacksmith's hammer). From this interest in harmony related theories developed, such as the view that health involves

a proper harmony of bodily fluids; the notion that moral excellence is a kind of harmonious relationship with nature; and most notably the idea of "the music of the spheres," wherein the heavenly bodies themselves move in such a way as to produce beautiful music, which most people do not hear because they are not themselves living in proper harmony with the universe.

A neo-Pythagorean movement, consisting of elements from Plato, ARISTOTLE, and the Stoics (see STOICISM), became influential in the first century BCE. Pythagorean mystical beliefs rose to prominence again during the Renaissance. For most freethinkers, though, the movement was too fraught with esoteric religious mysteries to be of much use in the search for truth.

TIMOTHY J. MADIGAN

RAND, AYN (1905–1982), American novelist, founder of Objectivism. Ayn Rand was born in Saint Petersburg, Russia, where as a youth she witnessed the Bolshevik revolution. She studied philosophy and history at Petrograd University with the aim of becoming a novelist. By this time, Rand had also reached some of the philosophical conclusions she would maintain for the rest of her life, including ATHEISM and anticommunism.

Novels. In 1925 she fled the Soviet Union for America, where she worked in Hollywood as a screenwriter. Her first novel, *We the Living* (1934), was a semiautobiographical work intended to show the crushing effect of totalitarianism on people of independent spirit.

Rand's next major work, *The Fountainhead* (1943), told the story of Howard Roark, an innovative architect who fights to live and work by his own standards in the face of social pressures to conform. As a novel of ideas, it dramatized Rand's distinctive form of individualism that opposed self-sacrifice in any form—both the Christian altruism of most conservatives and the collectivist morality of the socialist Left. *The Fountainhead* became a best seller and was made into a movie starring Gary Cooper in 1949.

Rand's magnum opus, *Atlas Shrugged*, was published with great fanfare in 1957. It translated her ethic of individualism into a vast political epic about what happens when "the men of the mind," the producers who carry the world on their shoulders, go on strike against the expropriation of their wealth by a society that demands they serve others. While critics denounced the work for what they saw as its strident advocacy of selfishness and laissez-faire capitalism, it earned Rand a large following.

In the remaining years of her career, she wrote essays articulating her philosophical ideas, commenting on political and cultural issues of the 1960s and 1970s, and giving public lectures and interviews on her ideas. Much of her work was published in *The Objectivist*, a magazine she founded with her associate Nathaniel Branden; the most important of her essays were republished in a series of books on epistemology, ethics, politics, and aesthetics.

Humanism. Rand held that religion is a primitive effort to serve a genuine human need for a comprehensive worldview and moral code, but that it is based on an irrational belief in the supernatural. Similarly, she held that religious notions of reverence and worship reflect the idealism of moral aspiration but are misdirected toward the suprahuman. "It is this highest level of man's emotions," she wrote, "that has to be redeemed from the murk of mysticism and redirected at its proper object: man. . . . The man-worshipers, in my sense of the term, are those who see man's highest potential and strive to actualize it."

In this respect, Rand was clearly a humanist. Like other humanists, she believed that morality must be based on human nature rather than divine commands; she admired classical civilization as well as the modern Enlightenment, and regarded the medieval era as a dark interlude. She did not describe herself as a humanist, however, believing that the term was too general to be useful in describing a philosophical standpoint. She would have rejected many of the points in such humanist manifestos as the Council for Secular Humanism's "Affirmations of Humanism." Instead, she coined the term *Objectivism* as the name of her philosophy.

Objectivism. Objectivism subscribes to a broadly Aristotelian view of nature as a realm of entities operating in accordance with causal laws, knowable through observation and reasoning. Rejecting the claims of faith on the one hand and skepticism on the other, it holds that reason is the only means of acquiring knowledge, including knowledge of values. It also holds that the capacity to think must be exercised by choice. Reason is thus a faculty of the individual, no matter how much one may learn from others or gain from cooperation with them.

Independence in thought and action was one element in Rand's individualism. The other was ethical egoism—*The Virtue of Selfishness*, as she titled one of her books. If one is to act independently, she argued, then one cannot make service to others one's primary aim in life.

The foundation of the Objectivist ethics is the thesis that values arise from the conditional nature of life. Any organism must act to maintain its existence in the face of the possibility of death. In relation to that ultimate end, certain things are good for it while others are destructive. For human beings, whose primary tool of survival is

reason, a conscious, principled code of values plays the role that reflex and instinct play for other animals, guiding action to promote successful life and happiness (which Rand saw as the inner emotional barometer of meeting life's needs).

In line with her naturalistic ethics, Rand argued that productive work is the central value in human life, providing for the physical needs of survival as well as psychological needs for autonomy, creativity, and self-esteem. In line with her view of reason, she held that rationality is a cardinal virtue, with such virtues as integrity and justice as corollaries. In this respect, she believed in the selfishness of virtue: To achieve success and happiness in life, we should act on principle in pursuit of long-range goals, rather than indulge the whims of the moment or pursue short-term expediency.

Like Friedrich NIETZSCHE, Rand criticized altruism as a moral code that sacrifices the best in man—and the best *of* men—to the worst. But she rejected Nietzsche's belief in the right of "Supermen" to subordinate and exploit their inferiors. The basic principle of Objectivism's social ethic is that every individual is an end in himself and needs the freedom to act on the basis of his independent judgment. People should interact by voluntary means to mutual benefit. The role of government should be limited to protecting individual rights to life, liberty, and property, leaving people free in both the personal, spiritual realm (freedom of speech, conviction, lifestyle, sexual activity, etc.) and in the economic realm (freedom to work, trade, acquire and dispose of property). Thus the Objectivist political philosophy is libertarian: individual rights, limited government, and capitalism—free markets as well as free minds. Rand was and remains one of the chief influences on the libertarian movement today (see LIBERTARIAN MOVEMENT AND UNBELIEF).

Rand also wrote extensively about aesthetics. She held that art served a vital human need to keep abstract principles, values, worldviews, and ideals tied to the concrete reality in which we live and act, and to give such abstractions the immediacy of sensory experience. In effect, the artist re-creates reality in accordance with his or her (implicit) philosophy, through the selection and portrayal of subject matter; viewers respond in accordance with their own implicit worldviews. In *The Romantic Manifesto* (1971), she applied this theory to the major forms of literary, visual, and musical art. As an artist herself, Rand identified with Romantic novelists like Victor Hugo for their emphasis on human beings' power to choose and pursue values.

Reactions. Rand's ideas placed her outside the mainstream of opinion. As an advocate of capitalism, she was attacked by liberals for rejecting the welfare state and by conservatives for rejecting religion. At the same time, she was widely admired for offering a bold and inspiring alternative to conventional thought: bold in challenging common assumptions and pursuing her analysis to its logical conclusions; inspiring in its vision of human achievement and liberation. In the years since her death in 1982, a small but growing number of scholars have sought to understand and evaluate her work on its own terms. Her novels are increasingly read in courses on American literature, and she has entered the canon of major twentieth-century American writers and thinkers.

DAVID KELLEY

RANDOLPH, A. PHILIP (1889–1979), American labor organizer and humanist. Asa Philip Randolph is widely regarded as the "grandfather" of the US civil rights movement. He was born to a Methodist preacher but became an atheist (see ATHEISM). In 1917, he founded the *Messenger*, a radical publication advocating workers' rights and FREETHOUGHT. Like Randolph, the magazine's coeditor, Chandler Owen, was a freethinker. Both men were deeply influenced by the radical black freethinker Hubert H. HARRISON.

Randolph advocated socialism (see SOCIALISM AND UNBELIEF), pacifism, and atheism—three positions that most blacks could not accept. Randolph therefore downplayed many of his ideas, and even held an honorary membership in a black church in his later years.

Randolph organized black workers in many different areas of employment. In 1929 he became president of the Brotherhood of Sleeping Car Porters. Within three years, he built that black union into one of the most important and influential labor unions in the United States.

In June 1941 Randolph threatened a march on Washington to protest against segregation in businesses that received government contracts. In response to the threat, President Franklin D. Roosevelt signed the Fair Employment Act, making discrimination illegal in defense industries and in national government departments. Ran-

dolph kept the pressure on, even after the war ended. Due largely to his efforts, on July 26, 1948, President Harry S. Truman signed Executive Order 9981, making racial segregation in the United States armed forces illegal. In 1955 Randolph was selected to serve on the executive council of the AFL-CIO. Three years later, he led a march of ten thousand students to desegregate public schools in Washington, DC.

Randolph was regarded as one of the "Big Six" civil rights leaders, and helped to organize and lead the 1963 March on Washington.

In his later years, Randolph abandoned socialism, but his worldview remained progressive. He signed the *Humanist Manifesto II* and supported progressive causes throughout the remainder of his life. He died on May 16, 1979. His funeral was attended by dignitaries including President Jimmy Carter. The US Postal Service issued a twenty-five-cent postage stamp bearing his portrait. Today the A. Philip Randolph Institute keeps the leader's legacy alive.

NORM R. ALLEN JR.

RATIONALISM. The term *rationalism* refers to two quite different intellectual traditions and has two very different meanings. On the one hand, rationalism refers to a particular mode of mainly Western philosophy that emphasizes the order and rationality of the universe and the ability of human beings to understand this order by the use of human REASON. The philosophers most commonly associated with this tradition are PLATO, René DESCARTES, Baruch SPINOZA, and Gottfried Wilhelm von LEIBNIZ. On the other hand, rationalism also refers to a strand of contemporary nonreligious thinking and activism whose intellectual roots owe more to empiricism than to rationalism. We will consider each in turn.

Philosophical rationalism is as old as Western philosophy itself. A principal characteristic of traditional rationalism is the belief that true knowledge of the universe exists, and that humans can, if with difficulty, grasp this true knowledge. The nature of this knowledge was conceived differently, as was the means by which people could grasp it, but its existence was essential. For Plato, this knowledge existed in the Forms, which only specially trained philosophers could hope to understand fully. For Spinoza, the laws of nature/laws of God—the two being the same thing—performed that function. Those laws could be grasped by anyone of sound heart and mind who eschewed dogmatism and embraced charity and practical kindness.

Spinoza gives a good example of traditional rationalism in action when he posited what he called the divine law, the characteristics of which include: it is innate in human nature and is therefore common to all people; it does not depend on the truth of any specific historical situation; it cannot be understood through the performance of rituals or ceremonies; and, knowledge of nature/God constitutes the highest reward of the divine law. Plato outlined his variation of the divine law when he had SOCRATES declare: "Then of our laws laying down the principles which those who write or speak about the gods must follow, one would be this: *God is the cause, not of all things, but only of good.*"

The other defining feature of traditional rationalist philosophy was the exalted role given to reason as the premier means by which this essential knowledge of the universe could be grasped. For Spinoza, the key to understanding the divine law is our "natural reason," which "consists in deducing and proving the unknown from the known." For Plato it was a more mystical "capacity to grasp the eternal and immutable," which was his definition of a philosopher. Plato insisted we must "strive to reach ultimate realities by the exercise of pure reason without any aid from the senses."

It was in the light of this philosophical tradition that the agnostics at the end of the nineteenth century (see AGNOSTICISM) looked at the word *rationalism* to encapsulate their cause. Like their philosophical antecedents, the agnostics believed there was an understandable order in the universe, although they attributed it to laws of nature as evinced by evolution and physics rather than imponderable laws of God (see EVOLUTION AND UNBELIEF). And, just as important, the agnostics believed that reason was a sure means to arrive at reliable knowledge of the world, a means that could elevate itself above the hurly-burly of sectarian argument and counterargument. The agnostics also had a more recent usage of rationalists to draw from: the German Higher Critics of the Bible (see BIBLICAL CRITICISM). These scholars were often described by their evangelical opponents as rationalists, in the sense of overemphasizing the role of reason in understanding the Bible at the expense of faith.

This, then, was the context in which the RATIONALIST PRESS ASSOCIATION (RPA) was established in Britain in 1899. The RPA's adoption of the word *rationalist* was deeply influential on FREETHOUGHT movements throughout the British Empire. Australia, India, and New Zealand all have rationalist organizations to this day. The RPA defined rationalism as "the mental attitude which unreservedly accepts the supremacy of reason and aims at establishing a system of philosophy and ethics verifiable by experience and independent of all arbitrary assumptions of authority."

On the face of it, the RPA's definition carried on the rationalist tradition, particularly when it spoke of "unreservedly accepting the supremacy of reason." But other

aspects of this definition worked along a completely different trajectory. In eschewing arbitrary assumptions of authority and locating the basis of a system of philosophy and ethics in experience, this understanding of rationalism amounted to a comprehensive rejection of the traditional understandings of rationalism. The RPA's understanding of rationalism had as much in common with traditional empiricism as it did with rationalism. What is more, the definition was internally unstable, and it was not long before some of the tensions within this definition became apparent. There was the problem of accepting *unreservedly* the supremacy of reason when reason seems to work best precisely when it questions arbitrary assumptions of authority. Then there was the discontinuity between seeing reason as an attitude of mind and, at the same time, a philosophical system.

The 1899 definition of rationalism was a compromise between three divergent understandings of the term among nonreligious people. There was rationalism in the sense of being a cerebral corrective to irrational religious fervor. People who spoke of rationalism in this sense frequently saw a positive core to the religious impulse that was trivialized by popular zeal and superstition. They were the people most likely to speak of "rational religion" or the "religion of humanity." The utopian schemes of Auguste COMTE appealed to people who understood rationalism in these terms. This element within rationalism was moribund by the beginning of World War I. The true descendants of this line of thinking are today's religious humanists (see RELIGIOUS HUMANISM).

Other rationalists viewed their rationalism as being in fundamental opposition to religion. These were the people who traced their intellectual lineage from courageous rebels like Thomas PAINE, Richard CARLILE, and Charles BRADLAUGH. Paine's inclusion here is paradoxical, in that by virtue of the arguments he made in his principal works, he deserved to be considered as belonging to the strand of rationalism discussed above. But Paine's memory was preserved by people more at home in rationalism of this second sort. This militant understanding was expressed most fully by John M. ROBERTSON, who described rationalism as standing "first and last for the habit and tendency to challenge the doctrines which claim 'religious' or sacrosanct authority." The people who prefer to describe themselves solely as atheists (see ATHEISM) and who eschew other nonreligious titles as evasions are the descendants of this strand of thinking.

The third understanding of rationalism at the turn of the twentieth century was the one that took longest to find its natural constituency. It was best expressed by Adam Gowans Whyte in an unjustly neglected book called *The Religion of the Open Mind* (1913). Whyte was more sympathetic to the diversity of opinion among people, rationalists included. "A direct principle of rationalism," Whyte wrote, "is that every man must make his own religion." After noting the old ideal of the saints and apostles that we shall all one day profess the same faith, Whyte added that "it will, happily, never be realized."

Whyte's understanding of the open-endedness of rationality turned out to be the longest lasting of the three variations of rationalism that were apparent at the beginning of the twentieth century. His religion of the open mind is what developed into contemporary HUMANISM, which has come to speak less of rationalism and more of rationality as part of an integrated personality. When the British philosopher A. E. Heath was asked about rationalism in 1947, he spoke in terms of what it cannot do. Rationalism, Heath wrote, "cannot give us the glittering prizes of final certitude, which resplendent dogmatisms hold out for our attention. Nor can it provide us with the assurances and comfort of intellectual safety." It was with this in mind that the Rationalist Press Association changed the name of its annual publication in 1968 from the *Rationalist Annual* to *Question*. In justifying the change, Hector HAWTON wrote that commitment to "rational inquiry means that nothing at the outset is taken for granted, everything is open to question."

So, the contemporary understanding of rationalism has moved progressively away from the traditional understandings of philosophical rationalism—so much so that "rationalism" as a label for the movement has generally given way to "humanism."

Probably the finest rhetorical affirmation of rationalism was given by the great popularizer and controversialist Joseph MCCABE. Speaking in 1920 to a packed audience at Queen's Hall, London, during his famous debate on spiritualism with Sir Arthur Conan Doyle (see SPIRITUALISM AND UNBELIEF), McCabe declared: "I represent Rationalism. That is to say, I want the whole world to use its reason, every man and woman in the world. I will respect any man or any woman, no matter what their conclusions may be, if they have used their own personality, their own mind, and their own judgment, rigorously and conscientiously." We can quibble with this or that aspect of McCabe's formulation, but it captures the spirit of free inquiry which has always been the core principle of rationalism as understood by freethinkers.

BILL COOKE

RATIONALIST PRESS ASSOCIATION. The Rationalist Press Association (RPA) was one of the most significant FREETHOUGHT organizations of the twentieth century. Prior to its founding in 1899, freethought organizations usually had brief lives that revolved around one or two towering individuals. Once they departed, the organization quickly withered. It was the genius of Charles Albert WATTS to see the need for a new type of organization, and to succeed in creating one. In 1882 Watts inherited a tiny publishing firm from his father, Charles WATTS. Young Charles Albert developed Watts and Company into a profitable business, unlike most previous freethought publishing operations, which had brief, cash-strapped lives before becoming insolvent. Watts was an unassuming man who worked best outside the public glare, but he was brilliant at attracting lifelong loyalty from people wealthier and more outgoing than himself. His transparent honesty and willingness to take only a minimal wage from his publishing ventures helped boost that confidence.

The RPA grew out of a small committee that met in London on July 2, 1890, to discuss legal constraints against the expression of freethought. This group called itself the Propagandist Press Committee. In March 1893 it renamed itself the Rationalist Press Committee. By this time it was becoming clear to Watts and his allies that there was considerable support waiting to be tapped by an organization that avoided overly controversial or vulgar forms of freethought advocacy. In 1898 Watts rallied his many allies to transform the Rationalist Press Committee into a more ambitious form of organization. Taking advantage of the discovery by George W. FOOTE that formally constituted freethought bodies were legally entitled to receive donations and bequests, the Rationalist Press Association received its certificate of registration on May 26, 1899, and on September 18 of that year held its first public meeting.

The RPA was established as an educational organization and book club, with members receiving Watts and Company titles in proportion to the annual fee they paid. The *Literary Guide*, the principal RPA publication, served as an advertising organ for forthcoming Watts and Company titles and authors, additionally providing news and opinion on the current state of religion, and pieces on the history and nature of freethought. As an organization, the RPA rarely took direct part in political agitation, though it was happy to support various reform movements, and Watts and Company frequently published material advocating one reform or another.

The RPA's golden age included the years from its inception in 1899 until the onset of World War I. During that time it made some significant contributions to the secularization of Great Britain. It did this with a series called the Cheap Reprints, which proved to rival publishing houses that there was a large market for low-cost reprints of serious nonfiction. Light fiction had been published in this form before, but nobody believed that the poor, who could not afford the price of a hardcover book, would want to buy weightier material in cheap form.

Watts had to borrow money to launch the series, and it is testimony to his character that his friends were prepared to invest in such an apparently risky venture. The first Cheap Reprint was a collection of *Lectures and Essays* by Thomas H. HUXLEY, a hero of Watts's. Against all expectations, the Cheap Reprints sold very well. The first impression of *Lectures and Essays* sold more than 30,000 copies and the five titles released in 1902 sold more than 155,000 copies. Hardcovers sold for a shilling, and paperbacks at what Watts called the "wastepaper price" of sixpence. The series went on for ten years (with one title added as an afterthought in 1918) and sold more than 4 million copies. In the process, the RPA had rewritten the rules about publishing. Other publishers now saw that inexpensive nonfiction was economically viable. The road was open for the paperback and for works of popular science geared toward the general reader.

Established religion was alarmed by these developments. A flurry of pamphlets and articles lamented the poisoning of the working-class mind with so much ATHEISM and unbelief. In fact, not one of the Cheap Reprints advanced atheism. Most ranged from a liberal Christianity, through what would now be called RELIGIOUS HUMANISM, to a genial AGNOSTICISM. The Cheap Reprints series was gradually starved into submission after a protracted campaign by churchmen to prevent titles being sold at railway stalls and being stocked in libraries.

Watts and Company suffered from its own success. Its Cheap Reprints series attracted a host of competitors, chief among them Penguin, which began issuing cheap paperbacks in 1935. In 1929 Watts and Company tried to recapture the initiative with the Thinker's Library series. Altogether there were 140 titles in the Thinker's Library series, covering a wide range of topics and from a wide range of perspectives. Like the Cheap Reprints, the Thinker's Library was designed to make the works of leading thinkers available to people of modest means. The inexpensive hardbound volumes were originally sold at one shilling each, though prices soon rose in the wake of the Great Depression. Viewpoints expressed in the series ranged from those of nineteenth-century liberals and agnostics to firebrand Marxists (see MARXISM) radicalized by the Spanish Civil War. Subjects discussed were similarly broad: from sober histories to essays and light relief, from complicated works of science to undemanding novels, from Charles DARWIN to the rationalist

journalist Charles Gorham, from Samuel BUTLER to the gothic novelist Marjorie Bowen. For several decades people spoke of coming across a Thinker's Library title as being the turning point on their road to freethought. About 5 million Thinker's Library titles were sold over the life of the imprint.

Another important publication of the RPA was its *Annual.* It began in 1884 as the *Agnostic Annual*, becoming the *RPA Annual* in 1907, the *Rationalist Annual* in 1927, and *Question* in 1968. The series finally came to an end in 1980. During those years some of the best minds of the century were published in the annual: Bertrand RUSSELL, Karl POPPER, A. J. AYER, Antony Flew, Subrahmanyan Chandrasekhar, J. B. S. Haldane, H. G. WELLS, and many others. Throughout its run the *Annual* was one of the most important vehicles for rationalist scholarship and criticism.

And then there were the stand-alone titles published by Watts and Company. Without doubt its most successful from a commercial point of view was *The Riddle of the Universe*, written by Ernst HAECKEL and translated by Joseph MCCABE. The RPA's edition of this work, published in 1900, sold more than a quarter million copies and contributed mightily to the young organization's financial well-being. *The Riddle of the Universe* was one of the most influential books of the first decade of the twentieth century, attracting more than a hundred reviews and several book-length replies. Other important Watts and Company publications include the still-unsurpassed histories of freethought by J. M. ROBERTSON, McCabe's *Biographical Dictionary of Modern Rationalists* (1920), and some fine examples of popular science, including *Man Makes Himself* (1936) by V. Gordon Childe and *Science and History* (1954) by J. D. Bernal.

Conditions after World War II were not kind to the RPA or to Watts and Company. Charles Albert Watts retired from active participation in 1930 and died in 1946. His son Fred died in 1953, having worked himself into an early grave for the company. The Thinker's Library ground to a halt in 1951 and sales of stand-alone works plummeted while costs soared. The RPA took Watts and Company over in 1954 and sold it in 1960. The RPA then established a more modest publishing venture, Pemberton Books, which published a worthwhile series called the Humanist Library. Some generous bequests funded a short-lived revival of Pemberton titles in the 1980s before fading out later in that decade. Since then the RPA has published a few works under its own name, but the true successor to Watts and Company has become Prometheus Books in the United States. The outstanding individual at the RPA through these years was Hector Hawton, a journalist, author, and polymath.

After Hawton's death in 1975, questions about the future of the RPA have periodically been raised, especially as it has effectively left the publishing scene. To date no firm conclusion has arisen. The only wing of the original RPA to survive is its magazine. Originally *Watts's Literary Guide*, then between 1894 and 1956 the *Literary Guide*, then the *Humanist*, and since 1972 the *New Humanist*, the RPA's magazine is a remarkable record of intellectual and social thought since the 1880s. As with the *Rationalist Annual/Question*, some of the finest minds of the past century have contributed to the *New Humanist* and its predecessors. From the days of Gladstone to those of Tony Blair, the *New Humanist* has been giving a humanist perspective on the issues of the day.

BILL COOKE

REASON. Talk of reason—of rationality and of being reasonable—has come under considerable pressure in (if you will) our postmodern times (really a form of modernity), and from philosophers and other intellectuals who have felt—perhaps with a kind of misinterpretation—the force of Ludwig WITTGENSTEIN's, Thomas Kuhn's, Michel Foucault's, and Richard Rorty's thought. Even when sensitively employed, it is not evident that there is anything like objective and crosscultural criteria or norms of rationality and reasonableness with sufficient substance to enable impartial, well-informed people capable of careful reasoning to achieve a reflective consensus concerning the comparative rationality or irrationality—or the reasonableness or unreasonableness—of our various social institutions and social practices, or indeed of whole ways of life or views of the world. I am skeptical, though not extensively so, of this extensive SKEPTICISM about reason. I shall give here some of the reasons for doubting that reason is so wanton, while remaining acutely conscious that we do not sometimes speak of "wanton reason" for nothing.

Often we are not able to make fine enough discriminations and, in such circumstances, we have no basis for rankings or judgments in terms of the rationality or reasonableness of the various practices, institutions, or ways of life we are reflecting upon. But in some other circumstances it is plain enough what should be said. Before we judge reason to be wanton, we should be careful not to assimilate certain difficult cases to the more general run of things where the rational or reasonable thing to do is often not that problematic. That reason cannot always tell us what we ought to do does not mean that it never can, or even that it cannot often give us guidance in important areas of our lives.

I shall first set out a characterization of what is ordinarily meant by *rationality*, followed by a characterization of criteria of rationality both instrumental and noninstrumental. I shall then show how the important concept of reasonability cannot be assimilated to rationality and how it is also an important conception in our social life. That will be followed by what might be taken as a crucial test case: namely, whether Jewish, Christian, or Islamic belief for an educated twenty-first-century person is a rational or reasonable option. I shall attempt to show something of what must be done to answer this question, and I shall end with an examination of a Wittgensteinian challenge which claims that to attempt to make such global assessments of the rationality or reasonability of whole belief-systems is to give reason a *rationalistic* task that is not genuinely its own.

I

To understand rationality it might be well to start with a dictionary. If we look up *rational* and *reasonable* in the *Oxford English Dictionary* (OED), we find such things as the following. To be rational is to be endowed with reason: to have, that is, the faculty of reason. It is also to exercise one's reason in a proper manner and to have sound judgment and to be sensible and sane. Rational beliefs or rational principles of action are those which pertain to or relate to reason or are based on or derived from reasoning. They are beliefs and principles which are "agreeable to reason" and thus are "reasonable, sensible, not foolish, absurd or extravagant."

If we turn to the closely related term *reasonable*, we are told that to be reasonable is to have sound judgment, to be sensible, sane. We are also told that it sometimes means, curiously enough, "not to ask for too much." Moreover, something that is reasonable—say, a consideration, claim, or argument—is something that is agreeable to reason, not irrational, absurd, or ridiculous. And there is in the OED, as well, the somewhat surprising claim that being reasonable is "not going beyond the limit assigned."

I think philosophers would be ill-advised to make sport of these notions. They give us a sense of the terrain we are concerned with, and we might indeed even be somewhat skeptical whether in such a specification we philosophers have done much better. But all the same, if we are perplexed about rationality or reasonability, these dictionary definitions are not going to do much to help us. We surely are going to be puzzled about this "faculty of reason" or about being "endowed with reason." And we are going to be suspicious, as Charles Saunders Peirce was, about talk of "being agreeable to reason." What is this reason that we are or may be endowed with? If it is only the faculty of speech and the ability to think and argue that is being talked about, then it should be remarked that irrational people have that ability too, and also that thoroughly irrational claims have been expressed in nondeviant English, French, German, and so on. Moreover, extravagant and irrational claims have had valid arguments as their vehicles. Validity is but a crucial necessary condition for sound and rational argumentation. So, if being "endowed with reason" is only understood as being able to speak, to think, and to be able to form valid arguments, it will not be sufficient to give us an understanding of rationality.

Alternatively, we need to ask whether being endowed with reason or being agreeable to reason is simply its being the case that what is agreeable to reason is established or establishable by sound arguments, namely, valid arguments with true premises. If it is, then we are at least on familiar terrain. The problem then becomes the familiar one of determining when arguments are valid and of determining when statements are true or probably true. While this is surely part of the task of determining what is meant by rationality, it is not all of it, for there are principles of action which are said to be rational and attitudes of which the same thing is said. Yet concerning both such principles and such attitudes, it is not clear that the notions of truth or falsity have any determinate and/or unproblematic meaning. Moreover, we do not, in some instances at least, seem to be talking about knowledge claims here. But why should the lack of that rule out rationality? Finally, in this context, and to make a quite different point, it is also perhaps the case that not everything that is reasonably believed is believed for a reason or (arguably) because it is known to be true or probably true. So, while reason is perhaps not wanton, it is, on such a characterization, still perplexing.

We are, if we are perplexed by rationality, also going to have trouble with the OED's characterizations of rationality in terms of "exercising one's reason in a *proper* manner" and "being *sensible, sane* and of *sound* judgment," "not *foolish*, *absurd*, or *extravagant*." And having trouble with those, we are going to have still more trouble with such at least seemingly conservative and perhaps ideological notions as that to be rational is "not to ask for too much" or "not going beyond the limits assigned." The various notions cited only have a determinate meaning in a culture-specific environment. Some of them at least are definitely ideological; some of them are normative terms with a definite emotive force (*foolish*, *absurd*, *extravagant*); and (*proper*, *sensible*, *sound*). Even if some uses of these terms are not always emotive in their force, they are still normative and, as well or at least, are terms with criteria which are in many circumstances contestable. (Normative judgments about *the past*, such as "Greek slavery was wrong" or "Chinese foot-binding was evil," are characteristically not emotive utterances.)

Manifestly rational and reasonable human beings—or at least intelligent and well-informed human beings capable of cool judgment—often disagree about their criteria and about who is or is not of sound judgment,

sensible, reasonable, and the like. When a diplomat with a powerful agenda announces that such and such is a reasonable policy or that the parties in question are not being reasonable, I suspect—given my different orientation—that a rather ideological *persuasive* definition has been utilized; I realize that he or she and I do not, in some very important ways, agree about the criteria for rationality and reasonability.

II

Let us now look at some criteria that philosophers have set out for *rational belief* and *rational principles* of action to see if they are an improvement. Presumably, a rational human being will have rational *principles of action* and *rational beliefs*. Moreover, such a person will have rational attitudes that square with these principles and beliefs, and to be irrational—though this perhaps is not all that it is—is to not act in accordance with these principles and beliefs. But what are they? And are they as contested and as indeterminate as the conceptions expressed in the dictionary entries?

Rational beliefs are typically beliefs that can withstand the scrutiny of people who are critical of their beliefs: that is to say, they are beliefs that are typically held open to refutation or modification by experience including in some contexts experimental investigation and/or reflective examination; rational beliefs—to spell out a little of what is involved in the notion of reflective examination—are beliefs that must be capable of being held in such a way, all other things being equal, so as not to block or resist reflective inspection—namely, attempts to consider their assumptions, implications, and relations to other beliefs. Rational beliefs also are typically beliefs for which there is good evidence or good reasons or at least they are, all other things being equal, beliefs for which such evidence or reasons, where justification is needed, will be conscientiously and intelligently sought and evidence or reasons (when available and utilizable) will not in most circumstances be ignored by people who hold such beliefs. Finally, rational beliefs are beliefs that do not involve inconsistencies, contradictions, or incoherencies.

A rational person will also have rational principles of action. Moreover, he or she, at least habitually and unwittingly, will act in accordance with those principles, and it will be irrational of him or her not to act in accordance with these principles. The following are at least plausible candidates:

1. The most efficient and effective means are to be taken, all other things being equal, to achieve one's ends.
2. If one has several compatible ends, one, all other things being equal, should take the means that will, as far as one can ascertain, most likely enable one to realize the greatest number of one's ends.
3. Of two ends, equally desired and equal in all other relevant respects, one is, all other things being equal, to choose the end with the higher probability of being achievable.
4. If there are the same probabilities for two plans of action, which secure entirely different ends, all other things being equal, that plan of action is to be chosen that secures ends at least one of which is preferred to one of those secured by the other plan. (If none is, it is quite problematic which plan of action to prefer.)
5. If one is unclear about what one's ends are or what they involve or how they are to be achieved, then it is usually wise to postpone making a choice among plans of action to secure those ends.
6. Those ends that, from a dispassionate and informed point of view, a person values higher than his other ends, are the ends that, all other things being equal, he or she should try to realize. A rational agent will, all other things being equal, seek plans of action which will satisfy his other ends, but they should be adopted only insofar as they are compatible with the satisfaction of those ends he or she values most highly. (Is this to say that what is *valued* in certain circumstances must be *valuable*?)
7. A rational person will have rational beliefs, that is, beliefs that satisfy the preceding criteria of rationality, and rational principles of action; and he or she will in almost all circumstances act in accordance with them. (This does not mean a person will constantly be calculating what is the rational thing to do. To act rationally will be in accordance with those principles, but that does not mean that to be rational one must be consciously following those principles. We need a *dispositional* account here.)

With these principles of rationality, as with the dictionary definitions as well, there are areas of indeterminateness. Indeed they were quite self-consciously introduced in their statement. The clause *all other things being equal* is essential, as are such qualifiers as *typically* or *usually*, for without them the principles will surely fall to counterexamples: that is to say, there will be situations, real or plausibly imaginable, when it will be at least arguable that the rational or reasonable thing to do in those situations will not be to act in accordance with one or another of those principles.

However, even *if* something tighter is possible and is ultimately to be desired, a strong consideration in favor of the principles of rationality I set out is that they are at least a good subset of the principles of rationality operative in our lives and that these principles, like prima facie duties, usually always hold. That is to say—so as to

make clear that I am not unsaying what I say here—it is always the case that these principles, where applicable, usually hold—there is a presumption in all instances that they hold—in a way quite analogous to the way that for everyone all of the time it is the case that promises, generally speaking, are to be kept.

III

The preceding characterization of rationality is a rather minimal one that might with some plausibility be thought to apply cross-culturally and to hold for everyone. Jürgen Habermas, developing a conception of rationality following in the tradition of the Frankfurt School, has in his early writings given us a much richer but very normatively freighted conception of rationality. It would, no doubt, contain the principles of rationality already specified and it, like those principles, goes beyond what is specified in the ordinary use of *rational* and *reasonable* and their German equivalences; but it is still, I believe, in the spirit of those uses. At least it is plainly not in conflict with them. It will be well, in trying to gain an understanding of rationality, to set alongside the principles of rationality I have articulated, those conceptions of Habermas that are distinctively different. Then the ensemble should be up for critical examination.

Habermas in his earlier writings (including *Toward a Rational Society*) in a very considerable measure cashes in the concept of rationality in terms of an articulation of the concepts of enlightenment and emancipation. A fully rational human being will be an emancipated, enlightened human being. Such people will have critical insight and an enlightened consciousness, that is, a holistically coherent consciousness. They will have a firm sense of self-identity, and will have achieved adult autonomy, an understanding of human needs, and a liberation from the various illusions and dogmatisms that fetter humankind. Rationality, of course, admits of degrees, and this conception is trying to capture that heuristic ideal—*a fully rational person*—but it is also an attempt to specify what we put into our conceptualization of and indeed our ideal of full rationality or, perhaps, more in accordance with ordinary usage, full reasonability. This full reasonability will be coextensive with what it is to be enlightened and emancipated. Where enlightened and emancipated conditions obtain, and thus fully rational conditions (reasonable circumstances) obtain, people generally will be informed, perceptive, liberated, autonomous, self-directed agents committed to developing their own distinctive powers and capable of fairness, impartiality, and objectivity. They will typically be reflective about their ends, knowledgeable about the means for their efficient attainment, and they will be critical people not under the bondage of any ideology. Indeed, free from all self-imposed tutelage and indoctrination, they will see the world rightly. They will have identified the major evils of the world, and they will understand the conditions for surcease or amelioration of these evils and for the achievement of human community, to the extent that that community can be achieved at all.

Since then Habermas, worried about the indeterminateness of talk of "enlightenment," "emancipation," and the like, developed a much more theoretical conceptualization of rationality, namely, his account of what he calls *communicative rationality* that, while not in conflict with the above, goes in an importantly different direction and indeed meets an important lacuna in our thinking about rationality.

Habermas noted that ordinary language plays a distinctive coordinating role in human interaction. Language is used not simply *strategically* to achieve our ends but more fundamentally *communicatively* as well. I say "more fundamentally," for without these communicative uses, the strategic uses would be impossible. There are certain speech acts (a doing things with words) such as stating, deliberating together, arguing with each other, asserting, questioning, denying, proclaiming, doubting, interrogating, and the like which are *speech acts oriented toward public understanding and cooperation*. They are ways toward consensus building and trust-gaining between human beings. These are distinctive forms of rationality that cannot be reduced to instrumental rationality and without this communicative rationality, human interaction, including purposive rationality, would be impossible. Communicative rationality is typically procedural, but this procedural rationality would vindicate at least in ideal speech situations the substantive norms of rationality I have taken from Habermas's pre-1970 work.

IV

What I have said about rationality and reasonableness so far, with the exception of my last remarks about Habermas and communicative rationality, are equally compatible with foundationalism or antifoundationalism. Foundationalism has come on bad days, and I do not for a moment wish to suggest that this is just a fashion in philosophy, though only (and then not decisively) time will tell. But I do want to say something about wide reflective equilibrium which is a major *nonfoundationalist* and *coherentist* method of explaining and justifying, and with this showing the rationality and justifiability of beliefs. This is most clearly exemplified in rationalizing moral and political beliefs, though I have elsewhere as well extended it to critically examining the claimed justification of religious beliefs.

Arguably it is the dominant and most persuasive method for both explaining and justifying moral and normative political beliefs, commitments, and whole accounts of morality. Shuttling back and forth between our specific considered judgments, principles, well-embedded and reflectively acceptable practices, well-established empir-

ical considerations, and similarly established theoretical conceptions, it attempts to get our various considered judgments or convictions, uncontroversially accepted empirical beliefs, and uncontroversial theoretical scientific theories, plus beliefs of critical and reflective commonsense, into a coherent pattern of consistently held beliefs and judgments. This is a coherentist method but not a *purely* coherentist method for it takes our considered judgments, uncontroversial empirical, scientific, and commonsense beliefs to have some *initial* credibility. It seeks to forge these varied beliefs into a consistent and coherent pattern, perspicuously displayed, showing how they are not just a jumble. In the processes of winnowing some of them out, some of our considered judgments will be revised or sometimes even abandoned. We are certainly not sticking with "received opinions." In this way it is a *self-correcting method.* To achieve this is to achieve for a time a wide reflective equilibrium. It will only be for a time, for as inquiry and reflection go on any reflective equilibrium will eventually be upset and hopefully and reasonably expected to be replaced by another and more adequate reflective equilibrium.

Some *initial* credibility obtains for those of our considered judgments that we reflectively endorse and take as our starting points. Those that do not get winnowed out as we proceed in equilibrating, and continue to be reflectively endorsed, have considerable weight with us. Indeed, contrary to the proclivities of rationalistic ethical theorists, they have the strongest weight that any considerations can have. They are our beginning points and ending points in moral reflection. There is, of course, a strong urge on the part of many people to "get behind," to "find a securer foundation" for such a coherent cluster of considered convictions: to put more "trust in reason" than I am prepared to do. There is nothing like that to be had. To think there is, is a rationalist delusion. When there is such a coherence among our particular considered beliefs, the principles and practices that govern them, and the well-confirmed factual considerations that back them up, where they provide support or explanation for each other and they are optimally acceptable to us as evidenced by our disinclination to revise them further, we have the best justification of our beliefs that for a time it is possible to have.

If we say by way of criticism of the method of wide reflective equilibrium that we should appeal, instead of to considered judgments, to the *desires* that would remain (would not be extinguished) after thorough consideration of (1) the facts available to us and (2) logic, the proper response is that these desires are shaped by the same acculturating influences as are our considered judgments and convictions. We do not get anything more objective here, anything that is "closer to reality," more truth-tracking, or more rationally vindicated.

V

I have in the above sections treated "rationality" and "reasonableness" as if they meant much the same thing; and while they both come from the same Latin root *ratio* (reason), they are actually importantly different, and in moral and normative political thought "reasonableness" is the more salient notion. Moreover, though philosophers from PLATO to Thomas HOBBES to David Gauthier have tried to derive reasonableness from rationality, these efforts have turned out to be failures. A reasonable person will be fair and impartial in his or her dealings with other persons. A rational person might not. A reasonable person generally will not just press his or her advantage against others without considering their interests and without trying to consider them impartially. In other words, being reasonable in one of its central uses is something more directly linked with being moral than is being rational. Reasonability is linked with mutuality and reciprocity in a way that rationality need not be (except perhaps communicative rationality, which is best seen as a centerpiece of reasonability). We live in pluralistic societies where people have, in a way that cannot be overcome by careful reasoning, deeply different and sometimes conflicting conceptions of the good; but it is possible, where people can and will be reasonable, to agree not on conceptions of the good, but on conceptions of justice rooted in fairness or impartiality. Reasonable people will see they need a socially operative common conception of justice as one crucial thing which helps in keeping life from becoming nasty, brutish, and short. If reasonable people will reflect carefully, such a conception of justice will be regulative for them. Moreover, at least in liberal societies, to be justifiable to citizens of such a society, the conception of justice must be something that can reasonably be accepted by everyone where citizens are to be respected as free and equal and where everyone accepts that. This basic Rawlsian insight gives reasonableness a central role in moral and political thought and a priority over rationality in such thought. Both are, of course, central; but where a rational egoist or amoralist offends against reasonableness, as they must to be consistently either, *from a moral point of view their views are justifiably overridden.* From such a point of view and rooted in what it is to be reasonable there is no room for the question "Why should we be moral?" or "Why should I be moral?" But for a purely rational person with no more than at best an instrumental concern for reasonability (if such a being could exist), it is not so evident that such questions are closed.

VI

I turn now to a consideration of the rationality and reasonableness of religious belief. Consider a specific religion such as Judaism or Christianity. Can we both understand it and believe it? Are our criteria of rationality and

intelligibility such that it can be established that the core beliefs of Judaism or Christianity are irrational? Most fundamentally what we—or at least many of us—want to know is whether Jewish or Christian belief in God is a rational or a reasonable belief, or at least not an irrational belief. Not that this is perfectly parallel to a question pursued by E. E. Evans-Pritchard, Peter Winch, Alasdair MacIntyre, Steven Lukes, Martin Hollis, Charles Taylor, Jürgen Habermas, and others: Is the Zande belief in witches a rational belief? (The Azande are an indigenous Sudanese people, the rationality of whose supernatural beliefs has become the object of frequent philosophical examination.)

What we are trying to ascertain, both in the Zande case and in the Jewish or Christian case, is whether in terms of a common notion of rationality such as we have articulated in the previous sections, such beliefs can and indeed should be said to be rational, or at least not irrational. On the basis of what we said earlier about rationality, we are now assuming that it is *not* the case that one standard of rationality applies to the Azande and another to us; or in a more familiar context, that one standard of intelligibility applies to the Christian and another to the secularist. I will, that is, start by assuming a unitary conception, in certain ways indeterminate though it may be, of rationality, and see where it leads us.

In asking about the rationality of the Jewish and Christian belief in God, as well as in asking about the rationality of Zande belief in witchcraft, it is wise, I believe, to break down the question in the following way. (I shall do it first for the Zande.) Is the Zande belief in witches a rational belief? can be taken as either (a) Can we members of twenty-first-century Western culture with the rather full information and learning available to an educated member of our culture rationally believe in witches as the Azande do? or (b) Are the Azande rational in believing in witches? Have they acted reasonably and not disregarded evidence, reasoning, and information readily available to them in believing in witches?

In talking about the Azande it is plainly evident that it is important to distinguish between these two questions because what we have learned from social anthropology concerning other cultures should make us extremely loath (or at least wary) of claiming that an average Azande or the average member of any other tribe is irrational. But, given the pervasiveness and centrality to their way of living of Zande belief in witchcraft, this is exactly what we should conclude if we answer (b) by claiming that the Azande are irrational in believing as they do. But that seems very implausible. It would mean saying of a normal and average member of a culture that he or she is irrational. That very much sounds like ethnocentric hubris. Yet, on the other hand, we do not want, in acknowledging that the Azande are not behaving irrationally in believing in witches, to give to understand that if we Westerners do not believe in witches we are being irrational or ethnocentric or just pushing our liberal culture? Hence the importance of distinguishing between (a) and (b).

I will maintain that it is important to make a parallel distinction in talking about the rationality of Christian and Jewish belief in God. However, since in speaking of Christian and Jewish belief we are talking intraculturally and not cross-culturally between radically different cultures, the importance of drawing that distinction is not so evident to us. (It may be perfectly evident to someone coming from another culture.)

Let me first draw this distinction with greater exactitude, and then I shall try to show the importance of drawing it. Is the Judeo-Christian belief in God a rational belief? can be understood as either (c) Can we members of twenty-first-century Western culture with the rather full information and learning available to an educated member of our culture rationally believe in the God of the mainstream Jewish and Christian traditions? or (d) Are Christians and Jews rational in believing in God? Have they acted reasonably and not disregarded evidence, reasoning, and information readily available to them in believing in God?

There is an important disanalogy between (a) and (b) on the one hand, and (c) and (d) on the other, which we should note. There is no overlap in the class of persons referred to in (a) and (b), but there is in (c) and (d). There are plenty of Christians and Jews who are manifestly rational and reasonable and are members of the class of twenty-first-century persons who are highly educated and reflective. This is a sociological fact that we should not allow any ideological or philosophical convictions to obscure or distort. If anyone is to answer (c) in the negative, as one presumably would answer (a) in the negative, one will need to make out a very good case for the claim that while there are some Christians and Jews who are reflective, well educated, and manifestly rational, nonetheless their belief in God is irrational and that, in living in accordance with that belief, they—though perhaps understandably enough—are being irrational. (This, of course, does not mean that in other respects they are being irrational.)

This is a strong and indeed an embarrassing claim to make in our tolerant and (in many respects) liberal ethos. However, it is just the claim that anyone who consistently supports (c) must make, and it is a claim, radical as it is, that I shall make. (It is because of things like this that some people have accused me of "evangelical ATHEISM.") The important thing to see is whether it can be given a reasonable explication and a sound defense. There are many who believe that any such claim is thoroughly wrongheaded. T. M. Penelhum, for example, believes that while the claims of natural theology to give sound reasons for believing in God do not succeed, neither do the allegedly clinching arguments against religious belief, so that vis-à-vis Judaism and Christianity we are left in a stalemate. Reason—that is, human ratiocination and ration-

ality—cannot, he and many others believe, settle the matter one way or another.

What we are asking (assuming we are members of the class of reasonably educated twenty-first-century Westerners or are people who have gained a participant's understanding of that cultural background) is whether it is rational to believe in the God of the Jews and the Christians. We want to know whether such a belief is irrational for such people, that is, educated Westerners or people who have gained a firm participant's grasp of Western culture. Just as there are Azande who reasonably believe in witches, given what they can readily know, so there are plenty of Jews and Christians who are neither scientifically nor philosophically nor in any other very extensive way educated, who, given what they know and what is readily available to them, reasonably believe in God. This is not at all a patronizing remark, for we all stand—and unavoidably so—in that position vis-à-vis some beliefs.

Hegel is right in asserting that we cannot overleap history. (This note is not a form of relativism or skepticism, though it is a historicism.) But unless a certain relativism or skepticism about rationality is true (and indeed sufficiently coherent so that it could be true), there is no obvious reason, and perhaps no sound reason at all, for thinking that it could not correctly be claimed that reasonable people can have *some* irrational beliefs and indeed some very fundamental ones at that. In recognizing that we are all in the same boat, that we all may very well have some irrational beliefs, I show that I am not being patronizing to Jews or Christians.

VII

What synoptically should be said about the rationality/irrationality of beliefs is this: a belief (religious or otherwise) is in most circumstances irrational for the person who holds it if the person holding it is being either (a) inconsistent, (b) unintelligible (does not make sense), (c) incoherent, or (d) claims things that he or she could readily come to know are false or very probably false. It is also something which is irrational for him or her to believe if (e) it is held by that person in such a way that no attention is given to considerations of evidence that might be relevant (directly or indirectly) to the holding of that belief, or (f) the belief is held in such a way that the holder of the belief will not countenance the reflective inspection of its implications for his or her other beliefs or practices.

Centrally in asking whether the Judeo-Christian belief in God is rational, or at least not irrational, we are asking: (a) Is belief in such a God free of inconsistencies or contradictions? (b) Is belief in such a God intelligible? (Does such a belief make sense?) (c) Is belief in such a God a coherent conception? and (d) Is belief in such a God a belief in something which we have very good grounds to believe not to be the case?

If a belief in God is inconsistent, unintelligible, incoherent, or a belief which the person has very good grounds for believing that it is not the case, then belief in such a God is, all other things being equal, irrational for a person who recognizes any of these things or for a person who is in a position where he could, but for self-deception, recognize these things. (I say "all other things being equal" because if *only* the last condition holds, there is space for being a reasonable fideist.) We can say derivatively, if this is so, that the beliefs are irrational beliefs for that person.

The first and fourth questions, at least on the surface, are fairly straightforward, and only careful examination of the appropriate strands of religious discourse would give us good grounds for answering one way or another. But (b) and (c) are more troublesome. What are we claiming when we claim that such a religious belief is unintelligible or incoherent? What counts as "being unintelligible" or "being incoherent" here, and how can we (or can we) ascertain when this condition obtains? It would seem, from the above, that we are saying such beliefs are irrational because they are unintelligible or incoherent. But it has also been suggested that to say "a belief is irrational" is to say (among other things) that it is inconsistent, incoherent, or unintelligible. But then the *because* loses much of its force. Plainly, to make any headway here we must gain some clarity concerning what we are talking about when we claim that a religious belief is incoherent or unintelligible.

VIII

However, here, with the issues posed as they were in the previous section, we have a characteristic way of posing philosophical questions. There will be those who will feel that in posing them in that way we have unwittingly steered things in the wrong direction. There are, some will claim, no substantive norms or principles of rationality or criteria of reasonableness that afford us an Archimedean point in accordance with which we can make such sweeping judgments. The conception of rationality is too thin to give us such a skyhook. We need to take to heart Wittgenstein's penetrating and unsettling realization that there are just a diverse, sometimes incompatible, number of language games and forms of life with their attendant world pictures, with no possible objective ground (if that isn't redundant) for ranking them or choosing between them. We simply are taught (that is, socialized into) some world picture; we are unreflectively and matter-of-factly drilled in or indoctrinated in or, if you will, socialized into one such world picture. With that we have a number of beliefs—indeed, a system of beliefs—that stand fast for us, that we, at least in our practice and actual judgments, typically feel certain of and *assume* in investigating, doubting, knowing, or rationally believing. They are, if you will, our *vor Wissen* that we take as a matter of course in our diverse activities. They are the grounds, or at least the essential back-

ground, for what we rationally believe; but they themselves are ungrounded—and necessarily so. Or so Wittgenstein claims.

Christians—say, of the Middle Ages—had one such world picture with its related language games and forms of life, and Zande at the time Evans-Pritchard visited them, and contemporary Western secularists (to take two very different cases), have other importantly dissimilar world pictures. It is in accordance with these world pictures that we can say what rational/irrational or reasonable/unreasonable beliefs, practices, and institutions are. But we have no vantage point—and indeed can have no such vantage point—for making assessments of these diverse and sometimes incompatible world-pictures themselves.

If this is so, then the questions I tried to ask—or so at least it seems—are in reality questions that cannot sensibly be asked. We, it will be claimed, have no possible way of answering them that would not involve the question-begging procedure of simply, in accordance with the norms of rationality of one world picture, criticizing and judging the beliefs distinctive of a different world-picture. We use—or so it seems—one world picture as a club to beat the other world picture down. There is no way, the claim goes, of sensibly asking whether Christian belief is irrational because incoherent or inconsistent or whatever. This can no more be made out than it can be made out that English is inconsistent or German is incoherent or ordinary language is inconsistent. Such remarks are not sufficiently intelligible for the engine even to be idling.

So, at least some Wittgensteinians would say, we should not try straightforwardly to answer my questions, but we should first examine Wittgenstein's account—an account which, if near the mark, shows the senselessness or at least pointlessness of asking what I am trying to ask. However, it is also important to note that, whatever the results of that endeavor, Wittgenstein's account not only presents a challenge for arguments with a skeptical thrust such as my own, but it is also a challenge for a variety of theistic accounts as well. If one argues, as has been argued, that (a) the ontological argument, if sound, provides a rational ground for worship, and (b) argues that, as Norman Malcolm has, the ontological argument is sound, one runs afoul of the preceding Wittgensteinian questions about "rational ground."

One faces a similar difficulty if one claims that we should believe in God because the theistic interpretation is the most rational or reasonable explanation of human religious experience (see RELIGIOUS AND MYSTICAL EXPERIENCES). And finally, if Wittgenstein's remarks about rationality and world-pictures are right, it is impossible to establish in any significant way that, as John Hicks puts it, "faith-awareness of God is a mode of cognition which can properly be trusted and in terms of which it is rational to live." Even if we do not balk at "faith-awareness" and a "mode of cognition," whether it is rational to place our trust here and so to live is trivially "answered," if we accept Wittgenstein's account, in terms of the world picture we were taught. If you were brought up with a Christian, Jewish, or Islamic world picture and the instruction and indoctrination took, it is rational for you to trust the truth of that "faith-awareness." If you were brought up with a secular or Buddhist or Zande world picture, it is not. And that is the end of it. There is, and indeed can be, no superior vantage point of reason or cross-cultural criteria of reasonableness, our *wishes* to the contrary notwithstanding.

There is, in short, if Wittgenstein is right, no vantage point from which we could make progress with the "question" that many of us—who have no taste for metaphysics at all, in certain moods at least—very much want answered: to wit, and most centrally, which vantage point or world picture is the more reasonable one to accept and to live in accordance with? These are not—and cannot be—genuine questions if Wittgenstein's account is on the mark. But that very much cuts back our human expectations and hopes. It is hard to live with that. But if Wittgenstein is right, we should reconcile ourselves to it.

IX

We should, however, be cautious about drawing such severe relativistic or skeptical conclusions. Language games and forms of life are not *compartmentalized*. The criteria of rational appraisal I have described cut across them. Very basic things like asserting, inquiring, questioning, hoping, concluding, and remonstrating are distinct language games, but these we can engage in either in a rational or a not-so-rational way. Even if we think of larger activities such as the particular forms that science, religion, and law take in a particular society at a given time, there is no good reason to think they are in a class of their own and uncriticizable. At the very least, questions can be raised about how the various practices and forms of life of a society fit together. Could we get them into wide reflective equilibrium? If elements of the law or of religion conflict with well-grounded scientific claims, or with plain and careful empirical observations of what is the case, then given these conflicts, there is plainly a need to make adjustments somewhere in the belief system of the society and, given the strong way in which the scientific claims in question and the common-sense empirical claims in question are warranted, there are good reasons in such a circumstance to abandon or radically modify at least certain elements of the religious or legal claims. *If* this is scientism, then so be it. Am I just (unwarrantedly) using modernist enlightenment criteria to batter religious points of view?

Similarly, since the language games in a given culture are not insulated from each other (they are not self-contained units), there is good reason to believe that the criteria of what it makes sense to say and believe are not

utterly idiosyncratic to a particular language game. And to talk of incommensurability here assumes what Donald Davidson and others have made very questionable, namely, that that notion makes sense. Our conceptions of consistency, coherence, and evidence are not utterly language-game dependent. The words *not* and *or* do not function differently in religious, scientific, and legal discourse.

Coherence criteria are more difficult, but if, in one domain, we are forced to use conceptions that are very different from our other conceptions and that are conflicting or at least are apparently conflicting with conceptions in other domains of what it makes sense to say—conceptions we are indeed very confident of—we have good reason to be skeptical of the idiosyncratic conceptions: they are the odd person out. This is exactly the position that certain key religious conceptions appear at least to be heir to.

Jews and Christians, for example, must believe that there is an infinite individual (indeed a person) who is transcendent to the world, yet standing in a personal relation of caring for and loving the world and its creatures. Yet it is anything but evident that such talk makes any coherent sense at all. How can we give to understand that an individual is both transcendent to the world and that, at the very same time, that very same individual stands in some personal relation to it? Here the theist surely seems at least to be unsaying what he or she has just said. It is only a thinly veiled way of saying that at time *t*, *S* has property *p* and property not-*p*. Furthermore, it is anything but evident that we can understand talk of "a being transcendent to the world." If we are honest with ourselves, we should be very skeptical about whether such a conception has any coherent sense at all. And it is doubly impossible for an individual to have such a characteristic. Moreover, an "infinite individual" certainly appears to be self-contradictory. (If we say all these terms are used metaphorically, then we still must—at least in principle—be able to say in nonmetaphorical terms what they are metaphors of.)

Considerations concerning evidence are also not *that* language-game or form-of-life eccentric. It is true that theories are underdetermined by the evidence or data. We know, for example, from the archeological evidence that agricultural tools of a certain sort spread gradually into Europe over a certain period of time. But the theory that they arrived with new invading peoples who pushed out or killed the hunters and gatherers, and the opposing theory that the hunters and gatherers themselves, through cultural borrowing, gradually took up their use, are both plausible and they are both (or so it is plausible to believe) equally compatible with the evidence. The evidence does not determine which, if either, theory to accept. We cannot simply read off our theories or overall accounts from the evidence. When we have some well-elaborated and systematically coherent theories for which there is considerable evidence, the rational thing to do, again, all other things being equal, is to accept the theories for which there is the best evidence. (Stated in just the way I have, Galileo's theory is not a disconfirming instance.) Where, for all we can ascertain, the evidence is equally good, we should appeal to considerations such as fruitfulness, simplicity, elegance, or fit with accounts in adjacent fields.

While there *may* be some groundless beliefs for which nothing like evidence is in order, yet which are still rationally believed (for example, "Every event has a cause"), it is still the case that reasonable people will in most situations assume, in situations where evidence is relevant, that if their beliefs are justified there is evidence for them, and when their beliefs are not in accord with the evidence and others come up with a plausible set of beliefs that are in accord with the evidence, reasonable people will, all other things being equal, alter their beliefs in accordance with the evidence. Such remarks are not scientistic remarks reflecting the hegemony of "the scientific attitude" but cut across the various forms of life and, in that crucial sense, are not the property of one particular language game or cluster of language games.

So, if my argument is near to the mark, reason is not so wanton as some have alleged it to be. Principles of rationality and reasonableness exist that are universal and there are general ways in which we can appraise practices, institutions, traditions, and forms of life—though not all of them at once—with respect to their rationality or reasonableness without being entrapped in ethnocentrism or in some tendentious doctrinal or ideological stance. Judaism, Christianity, and Islam are such forms of life, and they can be so appraised in the light of experience and reason. The consistency, coherence, and evidential warrant of Jewish, Christian, and Islamic belief is of a very low order. I have articulated a tolerably unproblematic conception of rationality, and on that conception such doctrinal belief systems are not rational or reasonably adhered to by a twenty-first-century person with a good understanding of Western scientific and philosophical culture. It is neither reasonable for such a person to believe in Azande witchcraft nor is it reasonable for such a person to believe in any of the doctrinal systems of Judaism, Christianity, and Islam. Familiarity, for those whose lives are immersed in them, typically breeds acceptance, but that is all: not reasonable or rational acceptability, given a good knowledge of the world.

KAI NIELSEN

REICH, WILHELM (1897–1957), Austrian psychiatrist and sexual revolutionary. One of the most controversial writers of the twentieth century, Wilhelm Reich remains difficult to categorize. For some he was a genius whose writings on the function of the orgasm, the biological basis for neuroses, and the connection between the rise of fascism and sexual repression remain classics. For others he was an unstable eccentric whose writings on orgone energy, UFO attacks, and cancer cures were pseudoscientific at best and sheer madness at worse. Whatever one thinks about him, Reich was a true freethinker whose radical views upset all the existing power structures of his time, from the Nazis in Germany to the Communists in the Soviet Union to the members of the Eisenhower administration in the United States. As was once said of President Grover Cleveland, we should love him for the enemies he made!

Reich began his career as a member of Sigmund FREUD's circle, but was excommunicated when he questioned the efficacy of talk therapy. He developed his own approach to the mind-body problem by postulating a direct connection between repression and what he called "body armoring," holding that muscular rigidity was often caused by sexual frustration. This thoroughly materialistic view (see MATERIALISM, PHILOSOPHICAL) was perhaps his greatest contribution to the field of psychoanalysis, and for many years he was a successful practitioner in various parts of the world. He usually ended up leaving the countries where he lived (such as Austria, Germany, Denmark, and Norway), finding himself unwelcome for his advocacy of sexual liberation (he argued, for instance, that teenagers should be provided with private homes in which to experiment with sex partners) and his unorthodox political views. He was for a time a strong proponent of communism, but left the movement when he came to the conclusion that most of its advocates were essentially puritanical when it came to sexual matters. After coming to the United States he embraced the strong anticommunist views of the American conservative movement, and was therefore astonished when the US Food and Drug Administration prosecuted him for peddling false cancer cures through his production of so-called Orgone Accumulators. He had claimed to have discovered the basic force of life, "orgone," which could be harnessed for health purposes. Reich was sentenced to five years and died in prison.

One of the most moving works discussing Reich's life and career is his son Peter's *A Book of Dreams* (1989), which details from a child's viewpoint his father's iconoclasm and paranoia. It later inspired a popular song by the British singer/songwriter Kate Bush. One of Reich's strongest supporters was the philosopher Paul EDWARDS, a patient of Reich's in New York, who argued that for all of Reich's bizarre views much remained salvageable in his theories. In particular, Edwards felt that Reich's therapeutic innovations and his theory of "character armor" were still tenable, as were Reich's strong criticisms of organized religion as basically a perpetuation of patriarchal control.

Reich never wavered in his assertions that the basis for most religions was the sexual repression of believers. Religions tend to despise hedonistic enjoyment of any type, and control their members by making them ashamed of natural desires, which become perverted into desires for unachievable afterworldly bliss. All mystical and religious experiences, Reich held, are essentially antisexual and indeed substitutes for sexuality. He argued that if human beings were allowed to fulfill their sexual natures unhindered, most religions would die out and humans would for the first time in history be basically satisfied.

TIMOTHY J. MADIGAN

REINCARNATION. The idea of reincarnation—the view of life as a repetition of cycles and the physical world as

an illusion or test—presents itself in the history of philosophy and religion in a variety of contexts. At the most basic level, the belief involves speculation about a nonmaterial essence or "soul" which survives the body at death and which may be reincarnated or reborn in plant or animal life, or in the form of other human beings. Many ancient religions held loosely connected ideas about spiritual and physical changes after death (for example, Proteus, who could change his form at will); these seem to be derived from crude understandings of reincarnation. Similarly, although reincarnation does not normally entail belief in resurrection of the body as it has been understood in Christian theology, many scholars feel that both Judaism and early Christianity, in formulating their ideas of the afterlife, came under the influence of Greek reincarnational thought. The following article deals with the theory under the following headings: (a) Egyptian and later Near Eastern thought, (b) Eastern and Indian philosophy, (c) Greek thought, and (d) Early Christian theology.

Egyptian and Later Near Eastern Thought. It is often suggested that the origins of speculation about reincarnation can be traced to the ancient Near East (ANE) and to Egypt in particular. References to the underworld in ancient epics, such as that of Gilgamesh (second millennium BCE) seem to suggest that early inhabitants of the fertile crescent taught psychic survival as part of their religious tradition. The evidence for belief in reincarnation, however, is absent in Mesopotamian civilizations and must be read back into the literature from the religious theories of later periods. Similarly, there is no unambiguous reference to the preexistence or "transmigration of souls" (metempsychosis) in Egyptian literature, and a majority of scholars now feel that the cultures of the region, including ancient Hebrew civilization in Palestine, were generally pessimistic about after-death survival. The claim that the ancient Egyptians taught reincarnation is not based on references found in Egyptian texts, but on comments about the transmigration of the soul made by ancient Greek writers like Herodotus. The Egyptian Book of the Dead, for example, speaks of the soul being able to change itself into various life-forms after death. But this change is best understood as a sort of spiritual evolution in the heavenly realms, not a bodily return to this earth. As such, the belief seems to anticipate the later Christian and Gnostic idea that in ascending to heavenly realms to become "conformed" to life beyond the world, the soul undergoes a divestiture of physical substances. James Breasted, a noted professor of Egyptology at the University of Chicago, summarized the opinion of most Egyptologists when he said, "It was this notion [divestiture] which led Herodotus to conclude that the Egyptians believed in what we now call transmigration of souls, but this was a mistaken impression on his part." While it is true the ancient Egyptians believed both in an afterlife and in a "spiritual" realm beyond the world, the practice of mummification and the filling of burial chambers with practical items and symbolic trinkets was intended to prepare the deceased for the next world, not a return to this one or for survival as some other life-form.

It is equally clear that the Egyptian understanding of afterlife was based on an ancient caste system: members of the royal family and perhaps adopted members of the household were considered privileged to enjoy the benefits of the afterlife as reward for their high social standing. Ordinary persons were not included in the number of the elect, and were not considered able to transcend the limits of physical existence. In Egypt this belief remained fundamentally a hierarchical one: Eternal life is available to the few, forbidden to the many, and was a matter of class rather than moral status. This theme persists in the Gnostic religions of Upper Egypt until at least the fifth century CE.

The Near East beyond Egypt. Some references to reincarnation can be found in Zoroastrianism (Persian dualism), which flourished as early as the seventh century BCE; and in Mithraism, a mystery religion which survived into late antiquity and which preserves significant elements of the Persian cosmology. Mithraism was typical of the many salvation cults which emerged from the social and political upheavals that followed in the wake of Alexander the Great's colonization of the eastern Mediterranean. As the Middle East became more cosmopolitan, many ethnic and religious groups were uprooted and brought into contact with others in the mixing process known as religious syncretism. The resulting amalgamation of religious ideas and practices acted as a crucible which forged new religious movements with occult overtones, and these in turn were blended with Greek and Persian philosophy. In many respects these cults were expanded versions of more ancient expressions of pantheistic shamanism—the "witch doctor" religions of spirit worship common to all cultures. A crude form of reincarnation or rebirth remains a fairly common belief in shamanistic systems, with examples still to be found in Africa, the South Pacific, rural Asia, and even Alaska. These survivals encourage many scholars to conclude that the early roots of the doctrine lay in ancestor worship, fear of the dead, and other spectral practices rooted in tribal society.

Islam. Of the major world religions, only Islam persists as a dominant force in the contemporary Middle East. Arising some six centuries after the time of Jesus, Islamic belief is derived largely from biblical thought and history, though claiming its immediate derivation from its prophet, Muhammad. As a result of its grounding in biblical eschatology, the orthodox mainstream of Islam has disavowed reincarnation, adhering to the orthodox Judeo-Christian concept of resurrection of the dead and a Day of Judgment. It is sometimes maintained that the mystical wing of Islam, the Sufis, whose beliefs incorporate considerable oriental teaching and practice, have been believers in reincarnation since their inception. Showing traces of both Asian and

Gnostic influence, Sufism emphasizes the theme of the "journey" of the soul to life and spiritual rebirth. Scholars of the Sufi tradition however point out that the most prominent Sufi teacher, the imam al-Ghazali, insisted on the fashioning of individual souls and their "infusion" into human bodies at the moment of creation. Since the preexistence of the soul and its multiple rebirth is a defining feature of reincarnational belief, it is difficult to see Sufism as an exemplar of the tradition.

Eastern and Indian Philosophy. The precise historical origins of reincarnation doctrines in the East are difficult to trace, largely because Eastern philosophy is less concerned with the history and dating of events than the West. Nevertheless, most historians of religion would agree that the idea of reincarnation had its origin in the ancient speculative philosophies of India. A few Hindu scholars insist that the oldest of the Hindu scriptures, the Samhitas (not before 1200 BCE), teach reincarnation; but in fact no clear statement of the doctrine can be found in this very early literature. The majority of experts concur that the pervasive teaching of the Vedas is that of resurrection and immortality with the gods, similar to that found in other polytheistic religions of the time. The absence of early references to reincarnation in the Vedic literature suggests that the idea was not taught by the Aryans, who recorded these first Hindu scriptures. The first agreed mention, though very brief, comes in the Brihadaranyaka Upanishad, dating from the sixth century BCE. More elaborate discussion comes in the so-called Puranic age, at the time that the Puranas were composed, then cross-fertilized with Buddhist ideas. Many would date common acceptance of reincarnation in Hinduism from about 300 BCE, by which time the theme had been substantially explored by the Greeks.

R. C. Zaehner, an Oxford orientalist, was one of the first to argue that it is only when we come to the Upanishads that we first meet with the doctrine that was to become central to all Hindu thought. Zaehner maintained that in the Rig (earliest) Veda "the soul of the dead is carried aloft by the fire god, Agni, who consumes the material body at cremation, to the heavenly worlds where it disports itself with the gods in perfect, carefree bliss. There will be eating and drinking of heavenly food and drink, reunion with father, mother, wife and sons." In the Brihadaranyaka Upanishad (6.2. 15–16), however, a distinction is made. Purified by the fire that has consumed their bodies, the dead pass on into the flame, the day, the world of the gods, and hence into the lightning. A spiritual person conducts them into the worlds of Brahman. Of these there is no return; they have achieved eternal bliss. The followers of the sacrificial cult, however, pass on into smoke, the night, the world of the fathers, and finally into the moon. There they become the food of the gods: "but when that passes away from them, they descend into space, from space into the air, from air into the rain, and from rain into the earth. When they reach the earth, they become food. Once again they are offered as an oblation in the fire of a man, and thence they are born in the fire of a woman. Rising up into the worlds, they circle round within them. But those who do not know these two ways, become worms, moths, and biting serpents." Here, Zaehner thought, for the first time we meet the fully-fledged doctrine of rebirth.

While unarticulated ideas of postdeath survival predate belief in reincarnation, a popular doctrine of rebirth seems to have flourished from about 300 BCE. It is more apparent in the later scriptures, such as the late Upanishads and especially the Bhagavad-Gita. This semicanonical text, rewritten and edited well into the common era, refers pointedly to reincarnation in a number of passages, as when Krishna says to Arjuna: "Just as a person casts off worn-out garments and puts on others that are new, even so does the embodied soul cast off worn-out bodies and take on others that are new."

Buddhism. Belief in spiritual rebirth has been an integral part of Buddhism as well, although the imagery and vocabulary used in the Buddhist tradition differs somewhat from the Hindu system. The Sanskrit word *Samsara* or "wandering" is usually employed when speaking of the cycle of karma (justice) and rebirth. In ordinary use today among Buddhists and Hindus, it is taught as a law rather than as a doctrine subject to debate. Nonetheless, debate seems to have been fairly common among philosophers and sages in the Buddha's day (see BUDDHISM, UNBELIEF WITHIN). Whether the Buddha himself actually believed in its physical reality, taught it as an ethical concept, or as the continuance of the life force in some abstract sense is unclear. Classical Buddhist doctrine postulates the existence of *skandhas*, which are usually imagined as unrelated psychic energies or "causes" that are dissolved upon death and reactivated at birth. However, this notion is impersonal and hence different from the Hindu concept of an individual soul being reborn. In Buddhist speculation, each individual is born with characteristics from a variety of past lives and other karmic sources, in the same way a new house might be assembled from the wreckage of many houses. The characteristic ambiguity of Buddhism on this point is evident in this quotation from the Majjhima Nikaya, attributed to the Buddha himself upon being asked whether the world is eternal: "I have not elucidated that the world is eternal, and I have not elucidated that the world is not eternal. I have not elucidated that the saint exists after death, I have not elucidated that the saint does not exist after death. I have not elucidated that the saint both exists and does not exist after death."

The influence of reincarnational thought can be seen in early Chinese religion and philosophy as well. While such speculation is generally accepted in Taoism, for instance, its founder, the philosopher Lao-tse, did not explicitly teach reincarnation (see TAOISM, UNBELIEF WITHIN). Lao-tse's disciple Chuang-tzu, on the other hand, did teach the doctrine. Plausibly, therefore, rein-

carnational thought developed in China at about the same time it was being accepted in India.

Greek Thought. PLATO knew and employed a concept of reincarnation as a literary device in his dialogues, most famously in the tenth book of the *Republic* ("The Myth of Er"). It is not absolutely certain how literally one should take his references, since they are tied to his larger understanding of the immortality of the soul, the form of justice and the good, and the soul's inevitable separation from the body. Plato's laconic reference to the doctrine is attributed to SOCRATES, who speaks of it as an "ancient belief"—perhaps an allusion to the teaching of the mathematician-philosopher PYTHAGORAS, who held to a belief in metempsychosis, or successive reincarnation of the soul in different species until its eventual purification (particularly through the intellectual life of the ethically rigorous Pythagoreans). In both the Platonic and Pythagorean forms of the belief, the soul's preexistence and survival is contrasted with the imperfection and mutability of the physical body. The presence of the soul accounts for life, mind, and the potential for knowledge; its absence for death and decay. As with the presocratic idea of *nous* and *logos*, especially among the followers of Heracleitus, the mind-principle is conceived as an energy which "inhabits" material (the *soma* or body) but is not coextensive with it.

While Greek influence in the West faded with the demise of Alexander the Great's empire the doctrine of reincarnation survives in Roman philosophy, chiefly among the Stoics, and in the neo-Platonism of Plotinus and others. Both STOICISM and Neoplatonism possessed theosophical traits which mixed philosophical speculation with the teachings of the mystery religions, influences from Persia and India, and elements of traditional religion from the Greek and Roman pantheon. The "perfecting" of the soul for a higher existence through a series of rebirths was incorporated in both systems, which tended to see "salvation" as the solution of the body-soul dichotomy. A religious movement with an inconsistent teaching of reincarnation was Christian (and other) "Gnosticism," not a single religious phenomenon but a salad of beliefs which incorporated theological, mystagogic, and philosophical ideas about the origin and destiny of the soul. In its developed form in Egypt, North Africa, and the Middle East, gnosticism taught a division of humanity into elect, struggling, and "earthly" castes, determined on the basis of their spirituality and the soul's capacity for knowledge (*gnosis*) of revealed truth. Gnosticism taught the transmigration of souls among the spiritual class without, apparently, regard for moral evaluation or karmic law. The capacity for knowledge and hence for "salvation" from the entropy of the material world was denied to the *hylics* or "earthly," in much the same way ancient Egyptian speculation denied the benefits of the afterlife to the lower classes of society. Typically, where the doctrine is present, the speculation of late antiquity stressed that the goal of reincarnation is not the enjoyment of successive mortal life but the cessation of the pain of rebirth, often imagined as the regathering of the "fullness of the godhead" to primordial unity (*Pleroma*). Individual (pyschic) survival is not the goal of stoic discipline or gnosis, and in this respect reincarnational thought found itself at odds with rapidly evolving Christian ideas about the afterlife and personal immortality.

Pre-Christian and Christian Europe. The settlers of northern and central Europe, such as the Teutons, Celts, and Druids, had fairly sophisticated religious systems which were probably influenced by the thought of Greece and its colonies. Germanic and Celtic thought seems to have had points of contact with some forms of Eastern thought. Life was considered a time of trial: if its initiation was successfully passed, the spirit rested after death until the moment came for another return to earth. This continued until, after many lives, some attained to the state of spiritual perfection. These connections to the speculation of Greece, Rome, and the East were quickly obscured by the triumph of biblical religion after the fourth century CE.

The mainstream of Jewish tradition prior to the Hellenization of Palestine after the fourth century BCE shows a deficit in regard to speculation about reincarnation and resurrection, the latter becoming the core doctrine of the early Christian movement. Early Judaism possessed no dogma of resurrection and was silent on the subject of the soul's rebirth, preferring instead to emphasize a monism of body and soul.

Early Christian Theology. As a textual matter, the Bible does not teach the rebirth of souls. Nevertheless, at various times in the history of the church, particular passages have been interpreted by some theologians and movements to support a belief in reincarnation. Chief among these are John 6:4–5, words directed at the "seeker" Nicodemus ("One who has not been born again cannot inherit the kingdom of God") and a tradition relating to John the Baptist as the reincarnation of the prophet Elijah (Matt. 11:14: "If you are willing to accept it, he [John] is Elijah who is to come"; cf. 2 Kings 2:11). In general however, it is best to conclude with Geddes Macgregor that "[r]eincarnation was certainly not part of the principal ideological furniture of the Bible as it was of the literature of India that was the heritage of Buddha."

Reincarnation and the Early Church. Reincarnation was not officially condemned as heretical by the church until the sixth century. Prior to that time, individual Christian writers explored the doctrine with greater or less enthusiasm for its theological usefulness, most finding it, however, irreconcilable with a belief in personal immortality and a literal day of "final" judgement or eschaton. Of these, the most significant are the second-century writer Justin Martyr and the third-century theologian Origen, whose views concerning the preexistence of the soul were belatedly condemned at the Council of Constantinople in 553. In his "Dialogue" with Trypho,

Justin speaks of the soul inhabiting more than one human body, and mentions a belief that souls which fail in their duty pass into grosser forms." Justin does not embrace the idea, however, and agrees with his Jewish opponent Trypho that "souls neither see God nor migrate into other bodies."

The greatest controversy on the subject of reincarnation in the early church has raged around Origen, who is sometimes put forward as the most prominent proponent of the doctrine among the church fathers. Origen's views, however, were based on his radical insistence that the immortality of the soul entails its preexistence, in the same way the birth of the human person in time entailed the fact of his death. In his later writings, Origen explicitly denies a belief in reincarnation: "Let others who are strangers to the doctrine of the Church, assume that souls pass from the bodies of men into the bodies of dogs. We do not find this at all in the Divine Scriptures." Similar reviews of the belief, which was well attested in the opinions of the early writers up to the sixth century, are found in the writings of Tertullian, Jerome, and Irenaeus. Jerome's "Letter to Avitus" criticizes Origen for his Platonic ideas, and in a "Letter to Demetrius" he refutes Origen's teaching on preexistence, calling the latter's literary ramblings "a fountainhead of gross impiety." Jerome completes a succession of Middle Eastern and North African Christian writers who saw belief in reincarnation as fundamentally damaging to a belief in personal immortality as dogmatic accompaniment to the doctrine of the resurrection. Irenaeus devoted the entirety of chapter 33 of his polemic "Against Heresies" ("Of the Absurdity of the Doctrine of Transmigration of Souls") to refuting heretical appraisals of orthodox belief in resurrection, and Tertullian of Carthage lambasted the teaching of Pythagoras, concluding that "the doctrine of transmigration is a falsehood which is not only shameful, but also hazardous. It is indeed manifest that dead men are formed from living ones; but it does not follow from that, that living men are formed from dead ones." Among Christian scholars who studied the writings of pagan antiquity, Gregory of Nyssa was the most critical of the theory of transmigration: "They tell us that one of their sages said that he, being one and the same person, was born a man, and afterwards assumed the form of a woman, and flew about with the birds, and grew as a bush, and obtained the life of an aquatic creature. And he who said these things of himself did not, so far as I can judge, go far from the truth: for such doctrines as this, saying that one soul passed through so many changes, are really fitting for the chatter of frogs and jackdaws, the stupidity of fishes, or the insensibility of trees."

The nearly univocal view of the Christian West as it came more and more to be associated with the concept of "orthodoxy" (concurrence with the dogmatic pronouncements of bishops and councils) was that any attempt to accommodate reincarnational thought detracted from the doctrine of personal moral responsibility and the belief in individual immortality—especially the doctrine of future reward and punishment. Augustine, himself trained in the Platonic tradition and a Manichaean for a decade before his conversion, rejects the idea that souls can be "imprisoned" in the body for the deeds of past lives.

R. Joseph Hoffmann

RELIGION. A word of many uses, in the past *religion* was an honorable word. One might reject the ideas it carried, but one could respect the integrity of the word itself. Today its meaning has largely disintegrated. This has caused considerable confusion, not least in the world of Humanism, Rationalism, Secularism, and Freethought. In response to this confusion, the Board of Directors of the International Humanist and Ethical Union passed the following resolution in 1989:

> ***Use of the word "religion"***
>
> Being concerned about the confusion and contention sometimes caused by the words "religion" and "religious":
>
> This Board wishes to place on record the following points which can be agreed by all Humanists:
>
> a. Some Humanists use the word "religion" as roughly equivalent to "life stance"; others take it to imply some theistic or non-naturalistic reality.
> b. Those Humanists who use the word "religious" to describe themselves or their organizations do not imply that their Humanism accepts any theistic or non-naturalistic realities.
> c. In the sense of the word "religion" which implies "accepting a god," Humanism is not a religion; in the sense of "religion" meaning "life stance," Humanism is a religion.
> d. There is disagreement among Humanists about which is the "true" or "appropriate" meaning of the word "religion."

Religion and God. *God* and his works are key problems for religion. As *God* is indefinable, I base my analysis on a *necessary condition* for the reality of any god. This is based on the concept *naturalistic*:

> The universe is *naturalistic*: Values, purposes, meanings, and symbols derive only from evaluations by, and intentions of, natural beings.
>
> A *natural being*: a being capable of consciousness and limited by a material body.

This is an abbreviated definition of *naturalistic*. Ideals are not excluded, nor are extraterrestrial conscious beings, if they are limited by material bodies.

I introduce the word *superpurposive* for use in discussions of religion because *supernatural* has prejudicial associations with such dubious concepts as fairies, magic, and witch doctors:

> A *superpurposive being*: a being that evaluates and is not limited by a material body.
>
> The universe is *superpurposive*: There are values etc. which do not derive from evaluations etc. by natural beings. (Typically, they are the evaluations of a superpurposive being, but the Platonic Good [see PLATO] also is superpurposive.)

It seems plausible to accept that any meaningful god is superpurposive. Gods are seen as not limited by a material body, and also as evaluating things. For example, the Christian God loves us. The incarnation of the Christian God, like those claimed for the Hindu gods (see HINDUISM AND UNBELIEF), do not deny their transcendence of body. *Superpurposive*, thus defined, can replace the slippery and uncertain words *transcendent* and *spiritual* when these words are used in nonnaturalistic senses.

Religion is wider than God, but traditional concepts of religion appeal to a superpurposive reality. Thus the basis of the *Oxford English Dictionary* definition of *religion* is: "Recognition on the part of man of some higher unseen power as having control of his destiny, and as being entitled to his obedience, reverence, and worship." This "higher unseen power" must be superpurposive. Further, "life after death" also implies a superpurposive state, unless combined with resurrection of the body and the absence of consciousness until then. A "spiritual" existence for human beings after death would seem to imply a life with values but without a material body; again, this is superpurposive. Spiritualism (see SPIRITUALISM AND UNBELIEF) and communication with the dead through a medium are superpurposive. The idea of REINCARNATION as in Eastern religions presupposes a continuity of the person. This will include his or her evaluations, until nirvana has been reached. Primitive religions manifestly appeal to superpurposive powers. But a significantly different category of *naturalistic religion* has emerged over the last few centuries.

I will look at the ways "religion" has developed in response to new understanding. I will first look at those who have sought to keep a superpurposive reality in their religion. I will then look at those who have rejected the idea of *God*. Both these parts fall into two parts.

Maintaining a Meaningful God. People who have sought to keep God in their religion have responded in two ways: a conservative or full-blooded approach, and a liberal approach. Conservatives have countered attacks on belief by making claims that, if true, would allow a positive understanding of God to survive. Liberals have attenuated and obfuscated the idea of God in ways that conceal the term's degeneration. Christianity and Judaism are the principal homes of the latter approach, Islam of the former; Christianity, however, has a very strong conservative wing. Numerically, liberals are in decline, conservatives expanding. It is doubtful whether Anglicanism can avoid a schism between conservatives and liberals as here defined.

Full-blooded, doctrinally conservative Christianity may be summed up as *fundamentalism*, a term introduced in 1909 to refer to the inerrancy of the Bible, including in particular God's creation of the world, Christ's virgin birth, physical resurrection and future return in glory, and original sin, with Jesus's death as sacrifice for mankind. In all of this, Roman Catholicism is traditionally fundamentalist in substance; but fundamentalism in its proper sense also rejects any authority other than the Bible, so it rejects the Catholic acceptance of an authoritative tradition. Further, Rome has yielded more to science than has fundamentalism, for instance, accepting some elements of DARWINISM.

God's creation of the world has always been fundamental to Christian thought. *Evolution as such* does not exclude intelligent design (see INTELLIGENT DESIGN THEORY), for evolution might depend on a designer at certain key points. On the other hand, *naturalistic evolution* poses a fundamental threat, for random variation plus natural selection excludes God from the process *by definition*. Intelligent design is excluded only if naturalistic processes are sufficient at all key points.

The claim of biblical inerrancy (see BIBLICAL ERRANCY) still leaves open a wide range of ways for interpreting the text. For example, the six "days" of the Genesis creation story can be interpreted as "periods," and "begat" as "ancestor of." Creation extending over a long period is not inconsistent with a superpurposive creator; God might have employed the naturalistic processes accepted by geologists for the evolution of most features of the world. Different religious traditions reject different naturalistic claims, generating different interpretations of "religion," with the doctrine that the world was created from nothing in 4004 BCE at one extreme. The Roman Catholic church now seems to accept biological evolution. Some fundamentalist claims about evolution have a "flat Earth" quality, and they can be rejected as such. But if intelligent design is necessary for the evolution of humanity, God is necessary for creation. Thus naturalism, which rejects these assertions, requires PHYSICALISM and an effective naturalistic account of morality (see MORALITY FROM A HUMANIST POSITION).

Personal experience also is important, and not only for fundamentalists. Extreme manifestations—for example, those who have come to "know Jesus" at an evangelical meeting, or find their PRAYER answered, or seem to witness a miracle (see MIRACLES, UNBELIEF IN)—may come to an unshakable belief, however well argued the alternative interpretation. This is *evangelical religion*.

Keeping an Attenuated God. The pressures of liberal

thought lead to the abandonment of religious values, the abandonment often being justified by absurd interpretations of Scripture. For example, the Bible very clearly condemns homosexuality, as in Romans 1:24–27. Therefore Christian liberals who take inclusive positions toward homosexuality indulge in manifestly absurd manipulations of the text. Likewise, Muslim leaders point to the Qur'an's sura 5:32 to prove that Islam condemns killing people; but if one reads on one realizes that this passage forbids only the killing of those friendly to Islam, whereas (as demonstrated in the verse immediately following) nothing is too bad for those who attack Islam (see ISLAM AND UNBELIEF).

Another cause of religious decay is the widespread rejection of ethnocentrism: We no longer consider ourselves entitled to say that our culture is better than any other. Then must all the major religions be true? John Hick, a leading exponent of this view, solves the apparent contradictions by saying that no claim about the Real (his term that replaces "God") is either true or false. This would make acceptance of the Real literally useless. But Hick's basic claim is that no categories in human thought can describe the Real. So he saves religion by making an exception: *the Real is good from our point of view*. Thus he is able to draw positive conclusions.

The liberal wing of Christianity often expresses contempt for a "God of the gaps," that is, a conception of God postulated to fill gaps in our scientific explanations of reality. But rejecting a "God of the gaps" ultimately destroys God. For the only reasons to accept a superpurposive reality involve explaining those aspects of reality inexplicable on naturalistic, that is to say scientific, grounds. So, if a supposed God *explains no gaps*, there is *no reason* to accept his reality. Belief in god would be arbitrary, or based on a tradition based on nothing.

Finally, we come to Paul Tillich, whose radically inclusive definition of God drives much liberal religious thinking. Tillich opens an argument, "The name of this infinite and inexhaustible depth and ground of all being is *God*." He then allows "if that word has not much meaning for you, translate it, and speak of the depths of your life, of the source of your being, of your ultimate concern, of what you take seriously without any reservation." From this he concludes: "You cannot then call yourself an atheist or unbeliever." This is the ultimate degradation of religion: so to interpret god, that belief in God is the same as atheism.

No God. One may well conclude that there is no superpurposive reality. But this does not mean that there is no "ultimate reality." The happiness and suffering of individuals is ultimately important, and that (with the other elements identified in MORALITY FROM A HUMANIST POSITION) constitutes a *naturalistic* "ultimate reality." I now turn to the life stance of humanism. How is the word *religion* to be used?

Traditionally, *religion* has connoted not only God, but also ideas of commitment, community, morality, and much more. This does not make these concerns depend on "God"; they are essential human concerns which belong to all human beings. God believers have embezzled them. How then does a humanist interpret the word *religion*? One may recover these essential human concerns from the god believers in two ways.

People who have suffered the moral distortions introduced by appeal to "God" may *maintain* the superpurposive implications of "religion," and condemn it.

People who have experienced the good in their religion may keep the word to mark these human concerns. They are religious humanists (see RELIGIOUS HUMANISM). They explicitly *exclude* superpurposive implications from their definition of the word *religion*.

This sets up the two uses of *religion* noted in the IHEU resolution quoted above. No fair-minded person will impose his meaning of *religion* when he interprets a statement by the other group.

Religious humanists maintain the sufficiency of human foundations, in particular for ethics. ETHICAL CULTURE founder Felix ADLER also preached tolerance: on his view the supremacy of ethics and its independence of theology are essential; rejection of theism is not. Adler therefore left an element of inadequacy. *If there really is* a "God," "his" judgments could be vital: suppose that abortion *is* murder because God implants a human soul at conception. The independence of ethics from theology *requires* a key theological claim: the *rejection* of the "God" of the so-called major world religions. This premise was left implicit. Was Adler wrong not to impose such a philosophy on all his followers?

The difference between the first and the second group among those humanists who reject God is one of temperament, not of doctrine. Therefore the addition by the first group of the adjective *secular* (see SECULAR HUMANISM), *which declared secular humanists then use as a basis for attacking the second group*, is divisive and damaging to the humanist movement. Each group should respect the temperamental differences of the other. I also argue that the addition of "religious" by declared religious humanists is unhelpful.

Names are important. Humanists have made Humanism (I and others choose to capitalize the *H*) the name of their life stance, and they should fight for it, and against Christians who have recently recognized that "humanism" is an attractive idea. But the addition of an adjective is not the only response. The initial capital "H" can mark "Humanism" as the Humanist life stance.

Condemning Religion. Finally, I note that the word *religion* may also be used to refer to the undesirable aspects of religion. The Roman philosopher LUCRETIUS interpreted religion as *being bound by superstition*. Many modern users define religion as fanatical. Modern theists also reject *religion*. Thus Dietrich Bonhoeffer rejected religion as institutionalized, a special department of life. Christians sometimes call atheism a religion, in a way that seems to be abusive.

RELIGION IN CONFLICT WITH SCIENCE. Science and religion are modes of thought whose relationship with each other depends on viewpoint. Here we present a brief historical survey of how the relationship has been viewed in Western cultures. In general, two opposed positions may be identified. The first is a compatibilist view, which holds that science and religion are complementary and harmonious modes of knowledge.

Many historians of science would argue that the incompatibilist view is exemplified definitively in Andrew Dickson WHITE's *A History of the Warfare of Science with Theology in Christendom* (1896), which argues that theology has been a main opponent of science. However, White made a distinction, even if inconsistent, between religion and theology, which he saw as a dogmatic and arbitrary endeavor practiced by major organized religions such as the Catholic church. "Religion," which White viewed as the recognition of an "eternal law" that provided harmony for the universe, was compatible with science. A better example of an incompatibilist today might be Richard Dawkins.

A more recent trend is the so-called complexity thesis, usually attributed to John H. Brooke, which emphasizes that religion can both help and hinder science. One example is how many of the great scientists (for instance, Copernicus and Sir Isaac Newton) believed that it was their religious duty to study the universe, and also claimed that their discoveries validated their religious convictions. Complexity advocates would also argue that the very categories called "religion" and "science" did not exist in much of Western history, and so there could not have been any animosity between categories that were not recognized as such.

Part of the problem in determining the relationship between science and religion is how one defines those main terms. For our purposes, religion is a mode of life and thought premised on the existence of, and relationship with, supernatural forces and/or beings. Science relies only on one or more of the five natural senses and/or logic in order to verify any conclusions about the universe and its components. Under this definition of science, the term *supernatural* is meaningless, as it does not refer to anything that can be detected or inferred by any of the five senses and/or logic.

Ancient Times to Late Antiquity. Before the rise of Greek civilization, it is difficult to find any coherent use of nonsupernatural explanations for the universe and human experience. The eminent American Egyptologist James Henry Breasted identified the Edwin Smith Surgical Papyrus (approx. 1550 BCE) as the earliest known scientific document. This Egyptian medical manual lists physical conditions based on observation, presents diagnoses devoid of supernaturalistic language, and suggests treatment with natural substances or procedures. More contested are claims that certain healthcare consultants in ancient Mesopotamia used nonsupernatural means of healing.

The claim that the Bible contains "scientific" descriptions is found mostly in "creationist" Christian authors. For example, Isaiah 40:22, which refers to "the circle of the earth," is often used to argue that the author had supernatural knowledge of the true shape of the earth. However, the Hebrew word translated as "circle" can refer to the horizon or to the disk-shaped earth known from Babylonian sources. Other supposed instances of scientific thinking in the Bible are similarly the result of poor exegetical and linguistic analysis.

The tension between naturalistic and supernaturalistic approaches first clearly occurs in ancient Greece. In the work titled *The Sacred Disease*, Hippocrates argued that the condition often identified as epilepsy "is no more divine than any other; it has the same nature as other diseases." Hippocrates in fact argued that the disease process responsible for epilepsy was located in the human brain.

De Rerum Natura (On the Nature of Things; first century BCE) by the Roman philosopher LUCRETIUS strives to explain all of nature on the basis of naturalistic assumptions. Lucretius saw science as a tool of ethics, insofar as the purpose of the former was to help us determine how best to live a happy and productive life. Nonetheless, *De Rerum Natura* has many of the elements that are standard in modern scientific explanations, including the idea that the earth is not designed for the benefit of human beings but is the result of random processes.

Christianity in late antiquity was already seeking ways to harmonize scriptural teachings with empirical observations. The church father Tertullian is sometimes credited with the idea that nature and scripture are two complementary revelations of God's workings. This idea can be traced in one form or another to the present. Augustine, the famous church theologian, opined that God could accommodate revelation to the simpler understanding of human beings, with the result that not everything in the Bible needs be taken literally. At other times, however, Augustine proposed divine miracles to explain scriptural statements (e.g., angels ferrying animals to Noah's Ark from distant islands).

The Middle Ages. The history of science has been marked by a tendency to identify pre-Renaissance precursors for modern science. This effort is part of a broader conflict about whether the Renaissance is as innovative as thought by some scholars. Another historiographical shift has been away from viewing any medieval scientific achievement as part of a unilineal descent from ancient Greco-Roman civilization to a

view that emphasizes an Islamic synthesis of Syriac, Persian, Indian, and Greco-Roman traditions. Also important was the rise of universities, which collected learned scholars and important books.

Among the compatibilists or exponents of the complexity thesis for the Middle Ages, we find David C. Lindberg, who argues that "there was no warfare between science and the church" because there was nothing close to modern science in medieval times. Nonetheless, even Lindberg grants that the reintroduction of ARISTOTLE into the West raised some serious concerns for the church's cosmology. Aristotle posited that the universe, including its basic structure and modes of operation, was eternal; this challenged the biblical notion of a divine plan with a definitive beginning and ending.

At least three responses to Aristotle were outlined: (1) The eternity of the universe could be demonstrated rationally, as argued by AVERRÖES; (2) the noneternity of the world was rationally demonstrable, as held by Saint Bonaventure; (3) reason could not decide the matter, a mediating position championed by Saint Thomas Aquinas. Nonetheless, the Aristotelian doctrine of the world's eternity was formally condemned by Catholic theologians in 1270 and 1277. The problem of causation, which can be traced to at least Aristotle and Plato, also concerned medieval theologians. Thomas Aquinas has been classified as a "concurrentist" in arguing that God and natural causes act together, in contrast to "occasionalists" who attributed all causation to God.

Similar conflicts can be seen in Islam. Averröes wrote *The Decisive Treatise on the Harmony between Religion and Philosophy*, which argued that there was no conflict between philosophy and religion. Averröes was writing in response to al-Ghazali, who believed that science must be judged by its utility for religion. In addition, al-Ghazali was an occasionalist who denied the existence of natural causes. However, some compatibilist scholars (e.g., Alnoor Dhanani in *Science and Religion: A Historical Introduction*) argue that the conflict between al-Ghazali and Averröes was untypical of medieval Islam.

The Renaissance. The Renaissance saw the beginnings of some of the most heated conflicts between religion and science, especially because new instruments such as the telescope and more careful observations of the universe found results incompatible with biblical statements about cosmology. Galileo GALILEI took one of the first steps leading toward the death of biblical cosmology by mounting a systematic challenge to the biblical notion that Earth was the center of the universe.

Ptolemy, inspired by Aristotle, held that an immovable Earth was orbited by concentric spheres in which the various planets and stars were embedded; this view was adopted as the official teaching of the Catholic Church. In contrast, Galileo sought to confirm the theory developed by the Polish astronomer Copernicus in his *De Revolutionibus Orbium Coelestium* (On the Revolutions of the Celestial Spheres, 1543) that the sun was the center of the universe. The church placed Copernicus's *De Revolutionibus* on the Index of Prohibited Books in 1616. In 1633 Galileo was tried and found guilty of teaching the Copernican system. His sentence included imprisonment, which was commuted to house arrest at his home near Florence for the remaining years of his life.

Some important historians of science argue that most of Galileo's arguments were no better empirically than those of Ptolemy, and that definitive confirmation of the Copernican system was not found until long after Galileo's death. Galileo's certainty seems to have rested on the assumption that mathematical simplicity is a guide to truth. Nonetheless, the Galileo episode shows that stark conflicts between religious and scientific conclusions were beginning to appear by the late Renaissance.

The Enlightenment through the Twentieth Century. The definitive rise of modern science is usually placed in the Enlightenment (see ENLIGHTENMENT, THE, AND UNBELIEF), a period during which we can see the compatibilist and incompatibilist positions emerge quite vigorously. Sometimes one can see incompatibilism as a natural outgrowth of the older idea that nature and revelation were two complementary books for understanding the universe. Francis Bacon, in his *Novum Organum* (1620), criticized Paracelsus, the Swiss physician and philosopher, for using the Bible to make conclusions about nature. For Bacon, the Bible often spoke metaphorically and was not a reliable source for understanding the workings of the physical universe. It was however a source for moral guidance and higher truths. In effect, Bacon, who favored empirical observation and experimentation, inspired others to make a sharp distinction between the domains of religion and science.

Isaac Newton provides a curious example of how religion and science could coexist in the same mind. Newton developed a form of calculus and outlined the law of gravitation in his brilliant *Principia Mathematica* (1687). Yet Newton was also heavily involved in the study of biblical chronology and prophecy, for instance, calculating that Jesus would return by 1948. Modern compatibilists use Newton to argue that religion and science need not be at odds. Compartmentalization of religious and scientific pursuits may also be another explanation, especially since none of Newton's scientific conclusions regarding gravity, calculus, or the spectral distribution of visible light depended directly on any supernaturalist supposition. When Newton erred, as in predicting the return of Jesus, it is when he did not use scientific rigor.

By the late eighteenth century, one finds naturalists whose work makes no reference to the supernatural. James Hutton's *Theory of the Earth* (1795), for example, lacks any reference to the Bible to draw its conclusions about the history of the earth. Charles Lyell, one of the founders of modern geology, joined other scientists of his day in beginning to blame reliance on the Bible for the retardation of scientific progress.

The first half of the twentieth century saw the meteoric rise of physics, marked by the near-total absence of any reference to supernatural premises. In the twentieth century the theories of Albert Einstein and the maturation of quantum mechanics under Erwin Schrödinger, Werner Heisenberg, and others, showed how difficult it is to speak of "cause" at the subatomic level, a fact that both compatibilists and incompatibilists have tried to cite to their advantage.

Whereas cosmology dominated the conflicts of the Renaissance and Enlightenment, biology—in particular, evolution—gained prominence in the twentieth century. The prime trigger was Charles DARWIN's *On the Origin of Species* (1859), which outlined what came to be known as the theory of evolution. For many Christians, Darwin's theories threatened the trustworthiness of the Bible, as both a scientific and a moral guide to truth (see LIFE, ORIGIN OF, AND UNBELIEF).

One hallmark of the twentieth century, particularly in America, was reliance on the legal system to define science and religion. The Scopes monkey trial (1925), wherein a Tennessee schoolteacher was prosecuted for teaching evolution, was an American highlight of this use of the legal system. Mid-twentieth-century US Supreme Court decisions urging a stronger separation of church and state led to the development of "scientific creationism," which purported to show without any recourse to biblical statements that the universe was the work of a (presumedly divine) creator. By 1987, in *Edwards v. Aguillard*, the US Supreme Court reaffirmed that evolution was "science," while scientific creationism was not. The latter, therefore, could not be taught in school as science.

Such Supreme Court decisions have prompted new refinements of creationism. INTELLIGENT DESIGN THEORY purports to show without recourse to any religious text that the universe, and particularly the earth, is intelligently designed for human habitation. However, critics argue that since the earth possesses millions of unique and infelicitous features such as viruses and cerebral palsy, intelligent design does not explain why we must conclude that the earth was especially designed for life, but not for any other unique feature, especially one deemed evil, such as cerebral palsy.

Equally significant is the globalization of the conflict between religion and science. The popular contemporary Turkish writer Harun Yahya (pen name of Adnan Oktar) promotes an Islamic version of creationism in books such as *The Creation of the Universe* (1999) and *The Disasters Darwinism Brought to Humanity* (2001). In his *Vedic Physics: Scientific Origins of Hinduism* (1999), Raja Ram Mohan Roy argues that the Hindu Vedas contain accurate descriptions of cosmology and physics, among other sciences. Usually, such non-Western harmonizations of science and religion follow indigenous as well as Euro-American models.

Another important development was the maturation of the field of the history of science itself. Thomas Kuhn's *The Structure of Scientific Revolutions* (1962) inspired many historians to argue that science is not an objective enterprise but rather a social and politically constructed endeavor. Thereafter, many Christian apologists began to use Kuhnian language to argue that science was no more objective than religion.

By the mid-twentieth century, improved technologies cured diseases previously attributed to supernatural causes. Yet the late twentieth century saw renewed efforts to integrate faith and medicine. In other ways, changing scientific definitions confronted some religious beliefs, as when the authoritative manuals of psychiatry moved away from seeing homosexuality as an illness to seeing it as part of the normal human spectrum of sexual expression. Technological changes introduced new ethical conflicts related to the prolongation of life, abortion, the increasing efficacy of contraception, and the medical utilization of biological resources such as stem cells (see BIOETHICS AND UNBELIEF). Old possibilities became realities: for example, cloning and the use of frozen embryos make it possible to be born years after the death of one's genetic parents.

Conclusion. A 1996 survey concluded that about 60 percent of scientists expressed "personal disbelief" or "doubt or agnosticism" about a personal god (see SCIENTISTS, UNBELIEF AMONG; LEUBA, JAMES). "Compartmentalization" rather than "complexity" may best explain why some scientists such as Newton could combine religious belief and scientific rationales in the same mind. Despite postmodernist academic movements that deny the existence of objective truth, universities continue to be the main exponents of nonsupernaturalistic approaches to knowledge. And if history is an indication, the relationship between religion and science will continue to center as much on sociopolitical developments as it does on epistemological issues. What is often at issue is not only epistemology but ethics, because scientific and religious moral systems can have vastly different consequences. In any case, compatibilists and advocates of complexity have yet to show where any scientific fact is directly derived, or needs to be derived, from supernatural premises.

RELIGIOUS AND MYSTICAL EXPERIENCES. The word *religion* seems to come from the Latin *religio*, meaning a joining or yoking, which is also exactly the meaning of *yoga*. Religious experience, then, would be experience that seems to join one with the divine or the cosmos. "Mysticism" stems from the Greek root *my-* and Sanskrit *maun* or *mun*, denoting silence and secrecy. In Greek, a *mystes* was an "initiate," one who had been introduced into the secrets of the cult, concerning which one must henceforth be silent, either so as not to cast one's pearls before swine (Matt. 7:6), or because they are "unutterable utterances" (2 Cor. 12:4). Thus mystical experience would be that of which those who say don't know, while those who know don't say.

Is There a Distinctively Religious Experience? Rudolf Otto agreed with Friedrich Schleiermacher that in the absence of revealed knowledge, we must try to show that religion is still something more than morality, lest religion be reduced to morality. So he argued, based on extensive research, that there is a uniquely religious type of experience. He called it the "numinous" experience, the encounter with the Holy. We usually think of *holy* as a moral term, denoting a morally blameless character. But that is a later, rationalizing redefinition. Originally no one sought to confine God within human categories of "good" and "evil." Instead, *Holy* meant "Wholly Other." Our experience with the uncanny other is twofold. First, we experience holy terror before the *Mysterium Tremendum* because it is overpowering, full of awe, and urgent with living energy. Second, we experience the lure of the *Mysterium Fascinans*, since the Holy is experienced as inherently august or worthy of worship and praise, as well as subjectively fascinating to us. Thus we are simultaneously attracted and repelled, enthralled and afraid. We feel keenly our own unworthiness and insignificance, not moral shame but ontological deficiency. This humility is "creature feeling" (something not too different from Schleiermacher's proposed "feeling of absolute dependence" as the essence of piety). Despite such abashment, we linger and dare to approach the Holy because, in its greatness, it is precisely what we need in order that our meager existences may be fulfilled. (Otto did not imagine that all or most religious believers actually experience the numinous. But the great religious founders must have, and the rest follow in their wake.)

Otto's theory has been widely accepted, but not by all. William James, for example, denied that there was any one specifically religious feeling. "Religious experiences" are instead constituted by the religious object and occasion of feelings that are as easily, in other contexts, moved by and directed to other things: fear, love, joy, and so forth. René Girard dismisses Otto's schema as ideological mystification of the fear inculcated by the higher classes, whose privileges all caste taboos exist to protect. There is nothing inherently "sacred" about it, unless one equates the sacred with priestcraft.

Conversion. James explains that in conversion a divided and unhappy person becomes happy and integrated as the result of a firmer grasp of religious reality. This may happen gradually or suddenly. Ordinarily we have various interests that take precedence at various times. Or we may have two parallel sets of aspirations, one of which always lies unattainable at the periphery of consciousness. But if one interest permanently takes precedence, and if this change is religious, we call it conversion—all the more if it happens suddenly. (Eric Hoffer, however, notes the same dynamics in play with conversion to any mass social movement, secular or religious.) The new commitment to religion channels and focuses all attention and emotional energy on religious subjects, providing a blessed sense of purpose and direction, though perhaps at the cost of repression and narrowness. The transformation may be effected by emotional shocks setting in motion great subconscious forces unknown to the convert and which he or she then considers to result from divine intervention, the grace of the Holy Spirit.

Conversions are a typical on-schedule puberty rite of passage, occasioned by the anxious awakening of hormones and new urges, of which the young person (likely already a churchgoer) is afraid and for which an inherited religious code makes him or her feel guilty. Conversion is a way of sublimating these libidinal energies into constructive religious channels. But, at least according to James, such conversions are a kind of imitation of the turnabouts of grown adults, who convert from irreligion to religion in a time of crisis. These latter are therefore normative for our understanding of conversion and yield two types: voluntarily wrestling oneself into repentance, and passive self-surrender. In the first case we can speak of "subconsciously maturing processes," the growth of religious attitudes, "eventuating in results of which we suddenly grow conscious." With the other type, after all agonizing seems fruitless one gives up, only to find the

desired change appearing *apparently* without effort. Actually, one's strivings, now abandoned, have unleashed subconscious processes which, left alone at the point of surrender, do their work unaided. Thus the conversion is achieved, apparently, from without.

Nondualism. The obliteration of all distinction between the self, the world, and the divine is the only experience to which the adjective *mystic* may be aptly applied. Agehananda Bharati says, "[I]t is the person's *intuition of numerical oneness with the cosmic absolute, with the universal matrix, or with any essence stipulated by the various theological and speculative systems of the world.* This alone is the mystical effort; a person who pursues it, and pursues it as his overwhelmingly central avocation—doing everything else marginally, so to speak—and who at the same time *states* that he has embarked on this quest, is a mystic."

This experience appears to be available in all religions, even those with which it would not seem readily compatible theologically. We find it described in very similar terms in Vedanta Hinduism (see HINDUISM AND UNBELIEF), Mahayana Buddhism (see BUDDHISM, UNBELIEF WITHIN), Sufism, and Christianity, as in the case of Meister Eckhardt. As Gershom G. Scholem, the great authority on Jewish mysticism, says, the mystics of any tradition are perfectly willing, not to say compelled, to reinterpret the scriptures and doctrines of their tradition to accommodate their experiences. While it is not uncommon for mystics henceforth to believe that their experiences have verified the ontological truth of their faith's doctrines, such assertions are both gratuitous (since they cancel one another out) and highly relativized by the demythologizing they themselves undertake on inherited orthodoxies. Richard Jeffries, Walt WHITMAN, and others have shared nondual mystical experiences without assuming any religious beliefs at all. Nor do nondual states of consciousness presuppose or cultivate any particular moral concomitant. They are neither reserved only for the righteous nor productive of righteousness. Bharati, himself both a Hindu monk and an anthropologist, readily admits that the experience is hedonistic in character, for all its shaking profundity. In this he differs from Huston Smith, who disdains Western religion for its supposed definition of the greatest good as heavenly pleasure, preferring Eastern mysticism with its supposed desire for the greatest degree of reality.

(Jewish mysticism alone seems to shy away from nondualism, retaining some fine line between the contemplating creature and the contemplated creator. Merkabah mysticism centers upon scripture meditation leading to visionary journeys to the heavenly throne, while most Hasidic mysticism is an almost Pentecostal rejoicing in the Torah and the presence of God.)

Brain science (see COGNITIVE SCIENCE AND UNBELIEF) has to a great extent accounted for the mechanisms underlying the nondual experience, suggesting that it is occasioned by an induced stymieing in the temporal parietal lobe of that function that enables the infant to begin differentiating himself from the world around him. This, of course, is exactly what Sigmund Freud had theorized without knowing the neurology of the matter. He understood mysticism as a return to the oceanic feeling of the womb. It is important to note, however, that the ancient yogis themselves understood the chakras, the kundalini, or even the deity as imaginary constructions focusing consciousness to bring about an altogether immanent psychological transformation. They described the "gods" as resident in the chakras, thus as functions of the human psycho-organism.

Bhakti Devotion. A major rival to nondualist mysticism in Hinduism and Buddhism is the yoga of devotion, bhakti. It is the fervent, heartfelt worship of a chosen patron deity. One seeks not the apprehension of static oneness with the god, but rather a thrilling love relationship with a savior who will provide salvation for his bhaktas, symbolized in Krishna worship as the Gopis: milkmaids ("groupies," as we should say) of playful Krishna. The rapturous Hare Krishna sectarians one sees dancing and chanting to drums and flutes represent a venerable bhakti sect stemming from the fourteenth-century guru Lord Chaitanya, whom they esteem a historical avatar (incarnation) of Krishna. But one need not abandon secular life to engage in bhakti devotion. In the signal text of this tradition, the Bhagavad Gita, Krishna tells the general Arjuna that he must obey the dictates of his socially (and divinely) prescribed dharma (destiny understood as assigned caste duty) of slaughtering his foes. This emphasis is sometimes called karma yoga, in which the devotee renounces worldly motives and rewards for ordinary tasks, performing them instead as an offering to one's patron god. Other objects of bhakti devotion include the fearsome "Mommy Dearest," Kali; her husband, Siva; and Ram, the heroic avatar of Vishnu whose exploits are recorded in the *Ramayana*.

Perhaps the largest Buddhist denomination in the world, the Pure Land school of Shinran, is a bhakti faith as well. In this case, the divine patron is Amitabha (Amida) Buddha, the subject of the Sukhavati (Pure Land) Sutras. This great being is thought to have lived as a king in ancient India, where he heard the preaching of one of the previous Buddhas and vowed on the spot to bend his pious efforts toward the creation of a pure land free of worldly distractions, into which all might be reborn who devoted themselves to him by calling upon his name in faith. Many millions have taken him up on his offer since the fourth century CE, when this form of Buddhism seems to have begun. Innumerable other Buddhists are devoted with loving fervor to Avalokitesvara, "the Lord Who Looks Down" in compassionate providence. Though technically a Bodhisattva (one on the way toward Buddha-hood), this savior, who even delivers sinners from hellfire, is thought to contain and embody all Buddhas and Bodhisattvas within himself.

Christianity has its own forms of bhakti devotion-

alism, including both the Roman Catholic cult of patron saints and the Evangelical Protestant "personal relationship with Jesus Christ" as one's "personal savior." This sort of Evangelical devotion seems to have originated in the late-sixteenth-century German Lutheran Pietist movement, from there spreading through Methodist revivalism, nineteenth-century Protestant world missions, and the twentieth-century Pentecostal movement—until it is now the predominant form of Christianity in the world. It might be described as a set of practices, especially daily prayer and introspection, in which Jesus functions rather like a child's "imaginary playmate."

Possession. Throughout history individuals have both sought and feared possession by alien entities, in the first case gods, in the second, demons. What is going on psychologically when people fall into trance states, believing themselves to have yielded to powerful discarnate spirits? William Sargent employed abreactive therapy with neurotic war veterans: If they could be induced to imaginatively relive their war traumas, Sargent thought, they would emerge free of them. Then Sargent discovered it was not so much the reliving of an actual past experience that did the trick as the cathartic emotional frenzy itself. Any story would do, even imaginary, so long as sufficient anger and fear were generated. The result would be calm and relief. Demonic possession, then, would be an effective imaginary experience generating the therapeutic frenzy, as well as the subsequent relief.

Structural anthropologist Claude Lévi-Strauss observed that the mythical dramas involved in primitive healing rites enable the afflicted person to give a name to what is bothering him or her and to join in the fight against it. A woman in the midst of a difficult childbirth may believe that demons are holding back the baby, and so she (or the shaman) summons Grandfather Alligator and his spiritual hosts to the fight, and she gives birth. It is required of the mythic drama only that it be analogous to the actual distress, for then it allows the sufferer to "get a handle on it" and participate in the struggle.

Both Sargent and Lévi-Strauss acknowledge that psychotherapy is a secular and naturalistic version of the very same abreactive technique. Exorcism, then, is a matter of self-fulfilling prophecy. In gaining recognition of oneself as "possessed," one is adopting a well-defined role in a game with strict rules, one of which stipulates that, after a suitable struggle with the one playing the exorcist role, one must retire from the field.

Speaking in Tongues (Glossolalia). This ancient practice of ecstatic or automatic "nonsense" speech has sometimes been understood as speaking a foreign language unknown to the speaker, thus inspired by God. Others, especially those who call it "speaking with the tongues of angels" (1 Cor. 13:1), have understood it as a metaphor, representing no literal language. Certainly the latter are correct, based on twentieth-century linguistic studies of glossolalia. For one thing, in long glossolalic utterances, "sentence melodies" (think of the formulaic singsong of news reporters or ad pitchmen) tend to be monotonously repeated, indicating artificially stylized speech. For another, each glossolalist manifests a distinct consonantal pattern (more or fewer dentals, diphthongs, etc.) which does not vary in that person's utterances, implying no foreign language, where patterns would vary, but that he or she is spontaneously "winging it," utilizing familiar speech patterns. Then there are too many "vowel rhymes" (*handalashondai*) for a genuine language. Nor is there apparent any syntactical structure, something discernable even without knowledge of a language's vocabulary. One's glossolalic utterances tend to sound more like those of one's initiator than the tongues spoken in another congregation or by a different "coach." Similarly, a congregation's glossolalic pattern is often temporarily influenced by the tongues-speech of visiting preachers. Additionally, glossolalic "sentences" or "bars" tend to be shorter and more emphatic earlier in the speech, itself rather long. Later on, the speeches as a whole tend to shrink in length, while the individual utterances become less intense run-on sentences. As time goes by, sentences become flatter, more monotone, made of fewer and easier vowels. These are not the marks of a language.

Psychological estimates of glossolalia differ widely. William James and George Barton Cutten, two of the earliest scientific investigators, viewed tongues as uncontrollable, senseless speech erupting from the subconscious like a "vocal hallucination." More recently, Felicitas D. Goodman has described it as the speech of "hyperarousal dissociation," a genuine but hardly pathological "altered state of consciousness." Julius Laffal wrote off glossolalia as a disguised or coded expression of repressed wishes on analogy with the verbal salad of schizophrenics; however, application of the Minnesota Multiphasic Personality Inventory indicates that even snake-handling Pentecostals are by no means psychologically abnormal and may even test as somewhat *less* neurotic than outsiders! John Kildahl found that glossolalists seemed more submissive, suggestible, and leader dependent than most, but other surveys by Vivier, Gerlach and Hine, and Alland found tongues-speakers to be *less* suggestible than the general population.

Carl Jung characterized speaking in tongues as the intrusion of the Collective Unconscious directly into consciousness, causing emotional instability in those who are unable to assimilate it. The Jungian Morton Kelsey, an Episcopalian priest and counselor, sees nothing aberrant in the practice: it is an entirely appropriate sign of an experience of the Collective Unconscious, which he pretty much equates with the Holy Spirit. Wayne Oates, also a pastoral counselor, and anthropologist Peter Worsley see glossolalia as a regression to infantile babbling, expressing childish megalomania and feelings of omnipotence. Worsley views this

as quite natural when glossolalia occurs among oppressed peoples.

Linguist William J. Samarin describes speaking in tongues as a "pseudolanguage function" possessed by most people but seldom used, except occasionally to fake foreign languages as a joke. Religiously, it functions much like the Latin Mass before Vatican II dumbed down the liturgy into Hallmark-card English. That is, glossolalia invokes a sense of numinous mystery for those gathered for worship. It is an "audial sacrament" of the "real presence" of God. Furthermore, insofar as all members of the group are urged to practice tongues-speech at one time or another, glossolalia functions as a "sign of election" as well as a shibboleth for group solidarity.

RELIGIOUS HUMANISM. Most contemporaries will understand HUMANISM as meaning "without God." The academic discipline of comparative religion could, however, have reminded us that several major religious traditions have long had variants that are "without god or gods"—Buddhism (see BUDDHISM, UNBELIEF WITHIN), Hinduism (see HINDUISM AND UNBELIEF), Jainism, CONFUCIANISM, Taoism (see TAOISM, UNBELIEF WITHIN). This article, nevertheless, will operate within the current Western meaning and treat "religious humanism" as a very recent movement holding that, to remain viable, religion must outgrow previous god-concepts and related practices.

While some Protestant and Roman Catholic Christians have called themselves humanist, this article will restrict itself to that considerably smaller group of persons recognized in academic circles and Internet circles as religious humanists in our time.

This modern religious humanism is much more than ATHEISM or AGNOSTICISM—although for most adherents it may well have begun with and remained grounded in some form of nontheism. Humanists, religious as well as secular, are strongly monistic and naturalistic (see NATURALISM)—there is but one world and one life, and the search for optimal values in the here and now is the supreme human quest.

Contemporary religious humanism has emerged largely from Unitarian circles (see UNITARIANISM TO 1961). In turn, those Unitarians who became religious humanists had in almost all cases first moved into or through a "liberal Protestant" position. In that intermediate orientation they had probably already discovered that religions change over time.

At the end of the eighteenth century, modern science combined with the thought of David HUME and Immanuel KANT had made it almost impossible for thoughtful persons to retain most of the classical arguments for theism (see EXISTENCE OF GOD, ARGUMENTS FOR AND AGAINST). Charles DARWIN demolished the last argument based upon alleged design in the universe (see EVOLUTION AND UNBELIEF). This left only newer arguments from moral values, intuition, and feelings—variously developed by Friedrich Schleiermacher, Albrecht Ritschl, the rise of a "social gospel," and several putative reconstructions of a "historical Jesus."

In the United States, the same freedom that allowed hundreds of denominations to be created allowed radical

religious experimentations and freethinking (see FREETHOUGHT). The Civil War had shown that it was impossible to speak meaningfully of a "Christian ethic" (since slavery had polarized most denominations). The emerging industrialism--with the immigration, racism, and imperialism it spawned—led to workers' unrest and suffragist movements (see ANARCHISM AND UNBELIEF; LABOR MOVEMENT AND UNBELIEF; WOMAN SUFFRAGE MOVEMENT AND UNBELIEF). For some Christians, arrogant triumphalism had been transcended by means of interreligious conferences and movements. But World War I again exposed the impotence of any alleged "Christian ethic."

In this same period, individual Unitarians, Universalists (see UNIVERSALISM TO 1961), Quakers, and Reform Jews had created organizations such as the Free Religious Association to develop posttraditional formulations (see UNITARIAN UNIVERSALISM; ETHICAL CULTURE). In some university-affiliated Protestant seminaries such as Harvard, Boston, and Chicago, frustrated theologians were exploring the viabilities of such modernisms as naturalistic theism, finite theism, process theism, naturalistic mysticism, and scientific theism. The most adventurous were even wrestling with Søren KIERKEGAARD's "infinite qualitative distance" (between the biblical God and us) and with Friedrich NIETZSCHE's Zarathustra proclaiming that "God is dead."

Religious humanism as such emerges from the efforts of several Unitarian ministers and several philosophers who mostly had Unitarian sympathies. John Dietrich, Curtis Reese, and Charles Francis Potter, the ministers, interestingly enough, had all grown up in quite conservative Protestant denominations. And the Unitarianism into which they settled was outside of the established New England conservative small-town variety. The American West had been developed by more adventurous ministers, including women (who were not likely to be called to congregations on the Eastern Seaboard).

Potter began as a Baptist minister, converted to Unitarianism, served a Universalist church, and finally in 1929 moved beyond churches to found the First Humanist Society of New York City. His books, many related to biblical scholarship, were widely read, and Mason Olds lists him as one of the main leaders of early humanism. His later interests in parapsychological issues distanced him from most other humanists.

Dietrich began as a Reform minister but was ousted for HERESY. He then took a Unitarian pulpit in Spokane, Washington, and soon attracted crowds so large that a theater auditorium was rented. He began using the term "humanism" there, and in 1916 was called to the First Unitarian Society of Minneapolis, a group with a liberal history. Reese began as a Southern Baptist minister, and shifted to the Unitarians in 1913. From his Iowa pulpit he worked on a number of social causes and then became secretary of the Western Unitarian Conference, based in Chicago. Reese had been using the term "democratic religion," but after a 1917 meeting with Dietrich began calling it "humanism."

Both were influenced by a University of Michigan professor, Roy Wood Sellars, whose books were proclaiming that the next step for religious people would be humanistic religion. When his ideas were also published by the Unitarians, the full-scale "humanist-theist" controversy emerged. In 1928 a Humanist Fellowship emerged among Chicago students, and in 1932 Sellars drafted a "Humanist Manifesto." Despite the economic depression gripping the country, this heavily optimistic document was published the following year. Signers included the professors John DEWEY, Edwin A. Burtt, A. Eustace Haydon, and J. A. C. Fagginer Auer. Jacob Weinstein (a Reform rabbi) and several ministers, mostly Unitarian, also signed.

The manifesto asserted that all supernaturalisms must be abandoned in order for human creativity to flourish, and for the "complete realization of human personality to occur." The new humanistic religion would extend to all human activities ("labor, art, science, philosophy, love, friendship, recreation") and will include cooperative social commitments, with the recognition "that existing acquisitive and profit-motivated society has shown itself to be inadequate and that a radical change in methods, controls, and motives must be instituted."

The signatories concluded: "Though we consider the religious forms and ideas of our fathers no longer adequate, the quest for the good life is still the central task for mankind. Man is at last becoming aware that he alone is responsible for the realization of the world of his dreams, that he has within himself the power for its achievement. He must set intelligence and will to the task."

The American Unitarian Association (AUA), distraught over its slow growth, appointed a Commission of Appraisal whose report in 1937 supported religious pluralism (and therefore kept conservative forces from suppressing humanism). Its chair, Frederick May Eliot, then served as AUA president until his death in 1958.

In 1941 the AMERICAN HUMANIST ASSOCIATION (AHA) was formed with Curtis Reese as president. As it grew, more secular liberals joined and the Unitarian dominance weakened. Corliss LAMONT, for instance, a major contributor and author, had little interest in, and few expectations for, a "religious" humanism.

To preserve the option for a humanism within a religious context, within the AHA and elsewhere, Edwin Wilson, along with other Unitarian ministers, founded the Fellowship of Religious Humanists in 1963. The name was later gender-corrected to "Friends of" and currently is HUUmanists. With Wilson as editor, the journal *Religious Humanism* began in 1967.

Within the ETHICAL CULTURE movement there was a development paralleling the humanistic emergence within Unitarian and Universalist circles. With this acceptance of a "humanist" labeling often went a will-

ingness to see their movement as "religious." The movement had historically focused on the "ethical" rather than the "religious" (Deed before Creed). Felix ADLER's underlying philosophical idealism was being replaced by a naturalistic PRAGMATISM. The initial aversion to supplanting any former religions that members might have chosen to retain privately had also been lessening. Thus closer cooperation and interchange occurred.

The Massachusetts Convention of Universalists, in 1948, underwrote the Charles Street Meeting House as a radical experiment. Kenneth Patton explored the world's religions naturalistically and produced a large body of humanistic poetry, prose, and hymnody. For instance, Luther's Reformation tocsin "A Mighty Fortress" was rewritten as "Man is the Earth Upright and Proud."

Leaders and ministers moved back and forth within these movements, and common educational programs were emerging for young people. Some of the unfulfilled dreams of the Free Religious Association were being realized.

In 1961 the Unitarians and Universalists effected a merger, using such adjectives as "free" and "liberal" to describe themselves. A 1966 survey indicated that a majority of members no longer saw themselves in either a Christian or a traditionally theistic orientation. Knowledge was held to come via science, and values were human constructions. An attempt to build the sciences, central in modern humanism, into the curriculum of Meadville/Lombard Theological School, however, failed. The journal *Zygon*, created during that attempt, is now managed by a Lutheran seminary.

Sherwin Wine, a Reform rabbi, created the Society for Humanistic Judaism in 1963, supporting a nontheistic form of Judaism that has spread internationally and created a training seminary (see JUDAISM, UNBELIEF WITHIN). The membership largely consists of persons wanting to affirm a Jewish identity and to maintain certain ritual practices without beliefs and laws that they view as no longer relevant.

In 1982 individual humanists from the major competing organizations formed the North American Committee for Humanism. Sherwin Wine was the founding president. The Humanist Institute, with Howard Radest as founding dean, was started with a three-year curriculum for leaders that would involve intensive study and coming together three times each year. More than a hundred students had graduated by 2005. The assumption was that recapturing common heritages would increase cooperation. Since then, Humanistic Judaism, Ethical Culture, and the Center for Inquiry have all instituted programs that draw from the same student pool. The Institute's journal, *Humanism Today*, reflects this across-the-board humanism in the writings of the Institute's adjunct faculty.

In 1980 Paul Kurtz founded an alternative organization, the Council for Secular and Democratic Humanism ("democratic" was included to avoid any confusions with Marxist "humanisms" in Stalinist countries). A major rationale was to combat the new strategy of the Religious Right in the United States that argued that "since humanism was a religion, it could be kept out of schools," an argument being used in opposition to the teaching of evolution (see EVOLUTION AND UNBELIEF).

If initial debates had revolved around whether humanism could be considered a religion, more recent discussions have concerned whether humanism should be regarded as secular and therefore not religious (see SECULAR HUMANISM). Humanists of all kinds are committed to church-state separation, so that kind of SECULARISM is not at issue.

Certainly, religious humanists exist. Most who would so self-identify are in Unitarian Universalist churches. Their practice generally involves sermons, hymns, Sunday schools for the young, and rites of passage (such as child dedications, marriages, and funerals). Their lessons are usually drawn from many religions and cultures. Many members of ethical societies would not employ most of these rituals, but might nevertheless define their group and activities as religious.

ROBERT B. TAPP

REMSBURG, JOHN ELEAZER. (1848–1919), American FREETHOUGHT lecturer and biblical critic. John Eleazer Remsburg was born on January 7, 1848, in Fremont, Ohio. He had little formal education early in his life, but was taught by his mother until he attended a few years of public school. On the whole he was largely self-taught. At the age of sixteen, he enlisted in the Union army and fought late in the Civil War in and near Washington, DC, and Maryland. After the war, he became a teacher and later superintendent of public instruction for Atchison County, Kansas. While there, Remsburg and his wife, Nora, had seven children. Remsburg continued his career in education until 1880.

After his career in education ended, Remsburg devoted his time to freethought lecturing and writing. He was involved with the AMERICAN SECULAR UNION (ASU), and was its president for several years. Strongly interested in United States history, Remsburg lectured on American historical figures and their religious beliefs. He published these lectures in books such as *The Life of Thomas Paine* (1880), *The Fathers of the Republic*

(1886), and works challenging the Christianity of Lincoln and Washington.

One of Remsburg's most famous works was *Six Historic Americans* (1906), an expanded version of *The Fathers of the Republic*, which was based on the lecture Remsburg delivered to the ASU Congress in 1886. Robert Green INGERSOLL, then president of the ASU, endorsed the *Fathers* publication, and this endorsement appears at the beginning of *Six Historic Americans*. Remsburg added the second part of the book, which dealt with Lincoln and Grant, to create this longer study.

Remsburg also had great interest in biblical criticism. Some of his published works in this area are *False Claims* (1883), *Bible Morals* (1884), *The Bible* (1903), and his other famous work, *The Christ* (1909). Remsburg's criticism dealt mostly with the morality of the Bible, showing conflicts between the various scriptures, but also with the morality of his time.

Remsburg was considered by many of his contemporaries as one of the great freethought lecturers, evidenced by his thousands of lectures delivered and his service to the freethought movement. Remsburg died in Porterville, California, on September 24, 1919.

TIMOTHY BINGA

RENAN, ERNEST (1823–1892), French biblical scholar. Ernest Renan cut short his Roman Catholic seminary studies to pursue a career as a private teacher and writer. He once commented that in order to write the history of a religion, one must both have believed in it once and believe in it no longer. From this standpoint Renan did go on to write a string of books on Christian origins and church history. The first of them was by far the most famous: *The Life of Jesus*, published in 1864. It triggered explosive controversy in Catholic France.

As he makes plain in his introduction, Renan had deeply imbibed German Higher Criticism, especially that of David Friedrich STRAUSS, whose *The Life of Jesus Critically Examined* (1835–36) shattered the supposed historical basis for drawing up a biography of Jesus from the gospels. And yet from Strauss Renan drew a surprising lesson, recalling Friedrich NIETZSCHE's dictum that when truth is seen to be a fiction, we have no alternative to creating our own fictions, all the while remembering that our fictions remain fiction, never allowing them to slip surreptitiously over into the vacant category of truth. Renan seemed to imagine that after Strauss, the biographer of Jesus was entitled to say what he pleased with no inconvenient facts to limit his performance.

Renan penned his *Life of Jesus* while vacationing in Palestine, the very scene of the gospel stories. It is plain that he allowed the gentle rusticity of the place to inspire him far more than whatever he might have read in Strauss. Essentially Renan composed a novel, full of romantic sentimentality. He drew upon the gospels interchangeably, troubling himself scarcely at all over either their historical authenticity or their original narrative order. Strauss had shown him that John's Gospel was itself fiction, but Renan took what he liked of it to embellish his portrait, leaving aside only the divinity of the Johannine Jesus. He equivocated on the question of miracles, finally coming down on the side of the rationalists, with their fanciful explanations of staged and misunderstood events.

The career of Jesus as Renan chronicled it had much in common with other early liberal lives of Jesus, envisioning an initial "Galilean Spring" of gentle teaching about a gospel of love and of the Kingdom of Heaven found in happy human fellowship in the summer twilight. After this, thanks to an insidious whispering campaign mounted by interloping Jerusalem Pharisees, the crowds begin to turn against Jesus, whereupon he headed south to Judea and Jerusalem, where he confronted his intransigent enemies with tragic results. In Renan's version, Jesus turned from his initial "Summer of Love" as he fell under the spell of messianic revolutionism. He began to rely upon miracle mongering (possibly chicanery) to reinforce the loyalties of the crowd as he made his way to the Holy City. But he soon realized this course was hopeless, and so he turned his thoughts to the doom which must surely overtake him. Renan speculated whether, during the agony of Gethsemane, Jesus might regretfully have contemplated the forfeited pleasures of an idyllic Galilean existence as a simple carpenter, enjoying the charms of one of the women who followed him with dreamy eyes.

The Life of Jesus, a pitiful piece of historical criticism, was nonetheless such an enjoyable piece of literature that it went through printing after printing, translation after translation. And it brought forth a plethora of rejoinders and rebuttals from traditionalists. But today's readers may be familiar with two modern life-of-Jesus fictions that are very much in the spirit of Renan and were very likely directly inspired by his *Life of Jesus*. These are Kahlil Gibran's *Jesus the Son of Man* (1928) and Nikos Kanantzakis's *The Last Temptation of Christ* (1960). Both partake of Renan's love for local color and natural splendor. And Kazantzakis appears to incorporate Renan's schema of stages: His Jesus first preaches love, then revolution, the fervor for which is quickly extinguished by the realization that he must die, prompting a reflection on the wholesome, mundane life he had sacrificed.

ROBERT M. PRICE

RESURRECTION. Resurrection refers to the supposed miraculous return to life of Jesus, the founder of Christianity, after his crucifixion and burial. The stories of the resurrection appear in the gospels at Matthew 28, Mark 16, Luke 24, and John 20. This article will treat the history of unbelief in the resurrection and also offer some reasons that justify that unbelief.

New Testament to Late Antiquity. The resurrection accounts themselves contain some of the earliest expressions of unbelief from both Christian and non-Christian sources. Matthew 28:13, for example, indicates that a story about Jesus's body being stolen was circulating among Jews within days of the supposed event. A disciple named Thomas is portrayed as initially incredulous about the resurrection (John 20:25ff.). In Luke 24:34–43, Jesus eats food in order to combat skepticism about his bodily resurrection.

Some self-described followers of Christ were ideologically opposed to belief in a resurrection. Of particular importance were Gnostic Christians, who believed that matter is evil and that God, who is pure spirit, cannot mix with flesh. Thus, the true God cannot die or be resurrected. Important Gnostic gospels (dating to around the fourth century and written in Coptic, a late form of Egyptian) were discovered in 1945 in Nag Hammadi, Egypt. In one of those Gnostic gospels, *The Second Treatise of the Great Seth*, Christ says: "For my death which they think happened, (happened) to them in their error. . . . It was another upon whom they placed the crown of thorns." Overall, the Great Seth deems the orthodox version of the life of Christ a fiction meant to obscure the life of the real Christ, who is completely spirit. The Gospel of Thomas, a copy of which was also found at Nag Hammadi, shows no awareness of the resurrection of Jesus.

Nonetheless, the resurrection became a central tenet of orthodox Christianity, which often appealed to 1 Corinthians 15:14 for support: "If Christ has not been raised, then our proclamation has been in vain and your faith has been in vain." However even in that chapter the author seems to be arguing for a spiritual, rather than a bodily, resurrection of Jesus.

Among non-Christians, the first substantive attack on the resurrection is found in *Contra Celsum* (Against Celsus), the apologetic handbook attributed to Origen. Ascribed to Celsus are various arguments that recur, in some form, to the present day: (1) the disciples lied or hallucinated; (2) some of the witnesses were women, and so could not be trusted; (3) the Christian story imitates pagan stories; and (4) Jesus may not have been as gravely wounded as the gospels make it appear. Celsus also wonders why Jesus did not show himself to everyone after the resurrection, something that would have put any doubts to rest.

Middle Ages and the Renaissance. By the Middle Ages, belief in the resurrection of Jesus was the orthodox position. A main rationale for belief was summarized in the dictum of Vincent of Lerins, who, in his "Commonitorium" (434 CE), defined truth as something "believed everywhere, always, and by everyone" (*quod ubique, quod semper, quod ab omnibus creditum est*). This dictum became easier to accept once the church had destroyed dissenting traditions, including most varieties of Gnosticism. Pope Leo I, for example, writes about the destruction of gospels that differed substantially from the canonical ones. At the same time, some medieval Christian figures such as Saint George were said to have been resurrected.

In medieval and Renaissance Europe, Judaism continued to be the main source of non-Christian unbelief in the resurrection. However, a new major strand of skepticism came from Islam, which according to orthodox Islamic historiography was a religion born in the seventh century in Arabia under God's last prophet, Muhammad. Its principal scripture, the Qur'an, explicitly denies that Jesus was crucified or killed (Sura 4:157) and repeats apparently Gnostic ideas that Jesus merely appeared to have experienced death.

During the Renaissance, the European encounter with groups of people in the Americas eroded confidence in the standards of truth outlined by Vincent of Lerins. It became clear, for example, that the Christian resurrection story was not believed everywhere or by everyone. Missionaries often struggled to explain why the Christian resurrection story merited more credence than many of the stories found in the New World, some of which, like the Mayan *Popol Vuh*, also included gods who returned from the underworld.

Enlightenment and the Nineteenth Century. During the Enlightenment there was a definitive shift away from the reliance on authority and toward privileging reason and the five natural senses in any determination of truth. Within Christianity, John TOLAND (*Christianity Not Mysterious*, 1696) argued that nothing contrary to reason or above reason should be part of Christianity. René

DESCARTES penned a famous dictum (*dubito ut intelligam*; "I doubt so that I may know") emphasizing the use of skepticism as an instrument of truth. For Descartes, only those propositions that can survive the fiercest of skeptical attacks are worthy of the label "true."

Yet reticence to question the resurrection publicly, especially among non-Christians, is illustrated by Baruch SPINOZA, the famous Jewish philosopher. His views on the resurrection were most clearly detailed in private correspondence rather than in his celebrated *Theologico-Political Treatise* (1670), which otherwise acutely critiqued biblical miracle stories. Spinoza understood the resurrection of Jesus to be allegorical and spiritual rather than an actual historical event. Among other critical observations, Spinoza noted (á la Celsus) that the resurrected Jesus could have shown himself to everyone but did not.

Hermann Samuel Reimarus, a Christian scholar from Hamburg, Germany, is often credited with producing the first modern critical inquiry into the "historical Jesus" in an anonymous work called the *Wolfenbüttel Fragments*, which appeared in 1774–78. Reimarus set out systematically to examine critically three types of Christian arguments for the resurrection: (1) the evidence of the Roman guard, (2) Christian testimony, and (3) Old Testament prophecies. For Reimarus, nothing contrary to reason should be held as historically established, and he placed special emphasis on internal contradictions in evaluating historicity.

Specifically, Reimarus noted that Matthew is the only gospel that includes an account of the Roman guard, while the women in Mark seem to not know of any guards posted. Reimarus also notes that Mary Magdalene certainly thought it was possible for the body to have been removed (John 20:13). He added that if some of Jesus's own followers were skeptical, then modern readers, who are farther removed from the events, have even more right to be skeptical. Reimarus theorized that Jesus was a failed revolutionary killed by the Romans: Jesus's disciples, unwilling to accept his death, created the fiction that he had been resurrected.

Another German scholar, David Friedrich STRAUSS, brilliantly extended the work of Reimarus. Finished in about a year, the fifteen-hundred-page manuscript of Strauss's *Das Leben Jesu* (The Life of Jesus) was published in 1835 when the author was only twenty-seven years old. Strauss deemed it philosophically untenable to use acts of God to explain anything in history. Therefore, he held that there were only two reasonable explanations for the resurrection stories: (1) Jesus did not really die in the manner depicted, and (2) Jesus did not really rise from the dead.

The section on the resurrection in *The Life of Jesus* focused on internal contradictions among the gospel accounts. Strauss was particularly interested in inconsistencies regarding the locations at which Jesus was first sighted after the resurrection. In Matthew 28:7 an angel instructs the women to tell the disciples to go to Galilee, where Jesus will be seen. But then Jesus himself appears near the tomb and gives the same instruction in verse 10. For Strauss, incompetent editing could explain why many contradictions were not removed from the gospel accounts.

Twentieth Century. The twentieth century is marked by important textual and archaeological discoveries related to the Bible, the most famous being that of the Dead Sea Scrolls, first identified in 1947. The Dead Sea Scrolls also helped to overturn the notion that a homogeneous Judaism with only a single idea of a Messiah existed in the first century. Otherwise, twentieth-century skeptics continued to espouse variants of arguments made standard by Celsus, Reimarus, and Strauss.

The later twentieth century also saw dominance in biblical studies shift from Europe to the United States. Some of the most skeptical scholars were those belonging to the Jesus Seminar, initiated by Robert Funk, who served as president of the Society of Biblical Literature in 1975. The Jesus Seminar attempted a systematic ranking of historical probability for individual verses in the gospels, and, in true American democratic fashion, determined those rankings by a vote. Most Jesus Seminar scholars, John Dominic Crossan conspicuous among them, had in fact accepted the idea of "demythologization" popularized by the influential German scholar Rudolf Bultmann. "Demythologization" emphasized that the "truth" of Christianity did not reside in the literal historicity of key events. The story of the resurrection, for example, could convey "higher truths," such as hope in the face of despair.

The new media that matured in the twentieth century—motion pictures, radio, television, and the Internet—played an unprecedented role in debates about the resurrection. *The Last Temptation of Christ* (1988), the controversial film based on a book of the same name by Nikos Kazantzakis, ends with a crucifixion, not a resurrection. On a more humorous level, *Monty Python's Life of Brian* (1979) raised the possibility of an invented Messiah. Even Mel Gibson's *The Passion of the Christ* (2004), though a clear reaction against secularism, did not focus on the Resurrection as the main event of Jesus's life. Dan Brown's *The Da Vinci Code* (2003) challenged orthodox Christianity by suggesting that noncanonical gospels are more accurate in depicting Jesus as living a relatively normal and married life that included neither crucifixion nor resurrection.

Media attention is also largely responsible for maintaining interest in objects that, despite repeated refutation of their authenticity, continue to be advanced as supporting evidence for the resurrection. For example, radiocarbon dating indicates that the Shroud of Turin, which believers claim is the actual burial shroud of Jesus complete with the latter's image, is a creation of the Middle Ages (see SHROUD OF TURIN, UNBELIEF IN). But

numerous books still labor to show that it is authentic.

In 2002, sensational claims about the so-called James Ossuary began to be promoted by the popular magazine *Biblical Archaeology Review*. The ossuary, a container used to store human bones, bears an Aramaic inscription that translates as, "James, son of Joseph, brother of Jesus." Defenders assume that this James is the brother of the biblical Jesus, and argue that the ossuary constitutes the oldest extant evidence for Jesus's existence. However, the Israel Antiquities Authority has declared the ossuary inscription to be a forgery. Even if authentic, the James Ossuary would not show that Jesus resurrected, though believers often argue fallaciously that if one biblical claim is proven, then all biblical claims are presumed to be proven (e.g., if we can prove there was a Jesus, then we can presume that there was a resurrection).

Current Apologetic Trends. Academic defenses of the bodily resurrection of Jesus now emanate mostly from so-called evangelical/fundamentalist streams of Protestant Christianity; most combine older arguments with postmodernistic attacks on the "scientism" and "naturalism" of historians who disbelieve in the resurrection. In actuality, many of these apologists employ antinaturalism inconsistently. For example, the apparitions of the Virgin Mary at Medjugorje and elsewhere have supposedly been witnessed by thousands of people and exhibit many other parallels to the Jesus resurrection traditions, including witnesses of low status, the persistence of testimony despite threats, and the development of written traditions within the lifetime of the witnesses. Yet most Protestant apologists will use naturalistic explanations to discredit Marian apparition accounts while using antinaturalistic explanations to explain the Jesus resurrection accounts. Usually, defenses of the resurrection such N. T. Wright's massive *The Resurrection of the Son of God* (2003) do not even address seriously the parallels posed by Marian apparition stories.

William Lane Craig, perhaps the best-known apologist in Protestant evangelical circles, is typical in using a small set of supposed historical "facts" to support the historicity of the resurrection. Craig's inconsistent definition of a "fact" becomes apparent when one compares his view of Matthew 27:52–53, which relates that scores of resurrected people walked around Jerusalem at the time of Jesus's crucifixion. In that case, Craig believes that story not to be a "fact" because it occurs within an "apocalyptic" genre. Aside from not defining clearly why that passage is "apocalyptic" in genre, Craig leaves unexplained why he does not regard claims reported in an apocalyptic genre as facts. Nor does Craig explain why all of Matthew or Mark cannot be seen as apocalyptic, thereby rendering the story of Christ's resurrection no more a "fact" than what is found in Matthew 27:52–53. A more likely reason that Craig does not regard that story as a "fact" is simply that scores of resurrected people walking all over Jerusalem should have left some notice in non-Christian records.

We may briefly respond to some of the other common arguments for the resurrection as follows:

1. *We cannot otherwise explain the empty tomb.* As the Elvis phenomenon demonstrates, occupied tombs don't always prevent stories of empty tombs (or at least stories that the supposed occupant is not there at all). Moreover, the empty-tomb story cannot be verified by any independent source outside of the Bible.
2. *The disciples were willing to die for their testimony in the resurrection, which presumes that their testimony is true.* We actually do not know whether the disciples were willing to die for anything. Besides, a willingness to die for one's beliefs does not make those beliefs true.
3. *There was no preexisting resurrection tradition, so the Resurrection can be presumed to be linked to an authentically new event.* False. Mark 6:16 portrays Herod as invoking a resurrection belief in order to explain supposed sightings of John the Baptist, who had been beheaded. Besides, all traditions are, by definition, not preexisting traditions at their inception.
4. *Five hundred witnesses cannot be wrong or refuted.* Empirical evidence shows that large groups of people can report seeing nonoccurring events. Marian apparitions have been reportedly witnessed simultaneously by thousands of people, but most evangelical apologists do not see that as proof that Mary is alive. Besides, the claim of five hundred witnesses is found in a letter to the Corinthians (1 Cor. 15:6), who lived more than seven hundred miles from the supposed events, and so could not easily verify the truth of the claim in the first place.
5. *The time between the claimed event and the stories is too short for legendary development.* Usually, such a claim is based on dubious statistics about how long it takes for legends to develop, as well as very biased views of what constitutes a "legend." We know that highly developed stories can be promulgated and disseminated within hours or days of the supposed events (as was the case with Elvis stories).
6. *The gospels have otherwise been proven reliable.* Not true, or it depends on how one interprets certain passages. Luke, who is often regarded as the author of Acts, has a particular habit of mislocating burial places. Acts 7:15–16 indicates that the tomb of Abraham is in Shechem, while Genesis 25:9–10 (see also Gen. 23:19–20) places Abraham's tomb near Hebron. Moreover, Acts 13:27–29 indicates that it was the residents of Jerusalem, not the disciples, who placed Jesus in a tomb, something that contradicts other gospels that insist

that Jesus was buried by his own disciples (e.g., Matthew 27:57–61).

7. *The social disregard for women's testimony renders it unlikely that biblical authors would have chosen women as witnesses, and so we can presume the women's testimony to be an authentic tradition.* The use of supposedly unreliable witnesses in stories of extraordinary events is one of the most persistent literary devices in the world. Thus, in Virgin of Guadalupe apparition traditions, an Indian peasant is the primary witness in events dated to 1531 in Mexico. In the movie *Independence Day* (1996) an alcoholic character serves as a primary initial witness to the arrival of aliens.
8. *Secular historians don't apply the same critical standards to non-Christian figures such as Augustus Caesar.* No secular historian argues for the historicity of any supernatural claim made for Augustus Caesar (who was also called "son of god") or any other figure, Christian or otherwise. But contemporary government documents and many inscriptions attest to the existence of Augustus Caesar in the first century, whereas not a single item for Jesus can be securely dated to the first century.

Conclusion. Stories of resurrections or their variants are generated more frequently than most people might believe: consider the resurrection stories associated with Saint George, the Virgin Mary, and Elvis. Apologies for Jesus's resurrection are still largely based on naive views about how quickly traditions of extraordinary events can originate and develop substantive followings. The idea that Jesus would resurrect is no more extraordinary than the development of the idea that Saint George was resurrected, or that Elvis is still alive. These traditions fulfill varying psychological, social, and political needs. Otherwise, we cannot trace the story of Jesus's resurrection any earlier than New Testament manuscripts of the third century BCE, notwithstanding adherents' great desire to believe that those manuscripts represent traditions of the first century.

HECTOR AVALOS

REVELATION, UNBELIEF IN. The claim that the gods had revealed their will and their plans for the future to human beings is ancient, and was part and parcel of the claimed divine right of kings to rule unquestioned. At the same time, the belief has also functioned since time immemorial as a source of balm to sooth the anxieties of societies, serving a purpose analogous to psychotherapy in our own. Given the fundamentally social nature of revelation, prophecy, and divination, it took major social dislocations and evolution to make disbelief in revelation thinkable at all. When a belief is as fully presupposed as the air we breathe, the air has to start smelling of pollution before anyone questions it.

In the most primitive societies, belief in revelation took the form of divination, a version of sympathetic magic based on the notion of the microcosm reflecting the macrocosm. If the one mirrored the other, one might discern the direction of one's fortunes by learning to anticipate certain stars coordinated with one's birth. Or one might be able to "read" the entrails of sacrifices, or the tea leaves from a cup one has drunk. People still read horoscopes today for the same reason: a dose of imagined security to help one face tomorrow. Shamans the world over went a step further than this, inducing trances so they might consult one's departed ancestors to see if they were causing one's troubles as a rebuke or to send a message. People still visit spirit mediums for the same reason (see SPIRITUALISM AND UNBELIEF). Shamans served as prophetic ombudsmen to resolve "small claims." But as societies became polytheistic, then monotheistic, divination was frowned on—albeit replaced by analogous means of revelation, namely, the oracles of the gods/God. The Urim and Thummim of early Israel and the mysterious ephod of the Old Testament were licit, as were the Delphic and other oracles in Olympian Greece.

As just anticipated, governments had their own forms of "official" revelation. Thus "unbelief" in the earlier, popular forms was often the function of competition between official and popular divination, especially since both could be lucrative. Hence Isaiah the prophet (Isa. 8:19; 47:13), himself attached to the regime in Jerusalem, rebukes people for consulting mediums and astrologers when they ought to be seeking guidance from God (which is to say, the priests of Yahweh).

Ancient societies drew no distinction between the various departments that we call "government," "religion,"

"culture," and so on. All values, beliefs, and mores cohered in the "sacred canopy" of a worldview whose linchpin was the gods, an ultraworldly peg from which the whole complex might be hung. As Émile Durkheim explained, individual conscience was imbibed from the society as a whole, as each one internalized the group's beliefs. These included the notion that disobedience to the laws, while it might escape the watchful eyes of human authorities, could not escape divine notice. Such fear would serve to keep people in line. At the same time, ascribing society's laws to a divine source signaled how fundamentally important they were considered, just as even secularists in our society tend to treat the Constitution with the reverence of a revealed scripture because it is fundamental to our national life. Thus it is no surprise that all countries believed and taught that their laws were mandated by the gods. Hammurabi received his code from Shamash, Moses from Yahweh, and so on.

The concept of a heavenly book whose pages might be glimpsed on occasion by a seer or visionary goes back to ancient Babylon. As part of the yearly festival of creation and monarchy renewal, the newly recrowned king would retreat into the temple behind closed doors and there ascend to heaven, where he would be vouchsafed a glimpse of Marduk's Tablets of Destiny. He would thus return to the throne forewarned and forearmed for another year. The people would be fools to question the policies of such a person. He was privy to the divine plan; they were not. For "unbelief" to arise in such a context required the overthrow of the government and its replacement by a new regime backed by foreign gods, who would henceforth do their own revealing to their own earthly vicars. Once monarchies fell to greater empires, the native traditions of periodic heavenly journeys of revelation fell to scribes, prophets, and priests, who assumed the pen names of ancient scribes like Baruch and Enoch, prophets like Elijah and Zechariah, and priests like Levi. That the belief in revealed books continues to shake the world today is evident from the crucial role still played in political extremism by both the New Testament book of Revelation and the Qur'an.

In ancient Israel, dissidents did not doubt the divine character of the legal order, but only that certain elites were entitled to mediate the official revelation as in the cautionary tales of Miriam, Aaron, Dathan, Abihu, and Korah. In Athens, SOCRATES' contemporaries, the Sophists (see SOPHISM), had learned an important lesson of cultural relativism and taught that no country's laws were god given. Though they did not mean to challenge the status quo their teaching was considered seditious, undermining public confidence in the government. In the mid-second century CE, Plutarch had his hands full arguing in *The Obsolescence of Oracles* against sophisticated skeptics who at least implicitly doubted the truth of the Delphic and other oracles—asking, for instance, why oracles were so much more rare than in past years, if they really constituted a divine phenomenon. And why did they speak so enigmatically? As RATIONALISM grew in the ancient world, social mediation increasingly took the form of court systems and arbitration. Laws were authored by governments in their own names. And even some who disbelieved in the gods altogether still thought it best to uphold the old religion publicly for the sake of the social order (see Cicero, *On the Nature of the Gods*).

It was only with the dawning of the Enlightenment that the twin movements of SECULARISM and the denial of revelation emerged powerfully (see ENLIGHTENMENT, UNBELIEF DURING THE). Each made the other possible. Doubting the rights of monarchs to rule entailed rejecting their claims to revelation, while losing confidence in revelation made it possible to doubt the king's divine authority. All fields of knowledge had been disengaging themselves from the church's apron strings since the Renaissance; and this meant, sooner or later, the setting aside of the myth and obsolete natural philosophy of the biblical writers as merely that, and not revelation. As the eighteenth and nineteenth centuries rolled on, developments both in philosophy and in biblical criticism shattered belief in revelation for many intellectuals. Immanuel KANT, himself the product of a German Pietist upbringing, established an epistemology according to which no knowledge was available that did not result from the processing of sense data by our mental categories of perception and logical functions of judgment. He had learned from David HUME the futility of the attempts of Gottfried LEIBNIZ, René DESCARTES, and others to find the truth by sheer speculation. And alleged revelation fell prey to the same objection as speculation: it did not rest on sense data, and thus could yield no certainty. With his famous set of antinomies, Kant showed how all questions about God, eternity, and the like which are beyond the proper scope of the senses and of rational processing, result in self-contradictions. Revelation thus proved philosophically untenable. Subsequent liberal theology, especially that of Friedrich Schleiermacher and Albrecht Ritschl, took Kant for granted and sought to rebuild Christian theology based on subjective religious experience or moral values, not on the bankrupt notion of propositional revelation—that is, information conveyed by God.

The higher criticism of the Bible (see BIBLICAL CRITICISM) revealed the book's many contradictions, myths, false authorship ascriptions, theological disagreements, and factual errors (see BIBLICAL ERRANCY). The upshot was that even if the idea of revelation were philosophically tenable, this book did not appear to be a revelation. Fundamentalists rejected these results of criticism, retreating into a ghetto-mentality hostile to all new knowledge (especially that of biology and evolution; see EVOLUTION AND UNBELIEF). Liberal Protestants shifted the meaning of revelation and redefined their view of the Bible. As the liberal Protestant Harry Emerson Fosdick would say, the Bible is a record of the spiritual evolution of ancient Jews and Christians, hence the unadorned

humanness of the book; but it was an unfolding experience of encounter with God—and this means that the Bible is a disclosure of the divine person, chiefly and definitively in the personality of Jesus. Neo-Orthodox theologians like John Baillie would say that what God reveals—primarily in the ancient events of biblical history, but also as we read of them in scripture—is not information about himself, but simply *himself*. The Bible, then, becomes revelatory as a catalyst for religious experience (see RELIGIOUS AND MYSTICAL EXPERIENCES). Theology is then the articulation of that experience (as Schleiermacher had already said). Scientific modernists and religious humanists such as the Unitarian John H. Dietrich simply rejected all belief in revelation rather than redefining it to death.

Nonetheless, it would be a grievous error to imagine that belief in divine revelation is passing from the world any time soon. It may be that resurgent Islamic and Christian fundamentalisms are revitalization movements dedicated to locking the barn door of their culture after the horse has escaped. Their very vehemence may betray their deep awareness that the jig is up and their fairy-tale world has passed. But, like Nietzsche's mad prophet proclaiming the death of God, we may have to recognize that this news has come to us too soon, and that the struggle with antirational revelation belief will yet be long and hard. For the time being we find ourselves like Queen Penelope, repelling a thousand suitors for our faith in their various "revealed" screeds. Walter KAUFMANN aptly sums up the position of the reasonable man or woman, and the inevitable necessity for unbelief in revelation:

> Those who pit commitment against reason and advise us to blind and destroy our reason before making the most crucial choice of our life are apologists for one specific set of doctrines which, to use Paul's word, are "foolishness" to those who have not taken leave of reason. They say their doctrine is infallible and true, but ignore the fact that there is no dearth whatsoever of pretenders to infallibility and truth. They may think [we ought to choose] their doctrine because it is offered to us as infallible and true; but this is plainly no sufficient reason: scores of other doctrines, scriptures and apostles, sects and parties, cranks and sages make the same claim. Those who claim to know which of the lot is justified in making such a bold claim, those who tell us that this faith or that is *really* infallible and true, are presupposing, in effect, whether they realize this or not, that they themselves happen to be infallible. Those who have no such exalted notion of themselves have no way of deciding between dozens of pretenders if reason is proscribed. Those who are asking us to spurn reason are in effect counseling us to trust to luck. But luck in such cases is unusual.

ROBERT M. PRICE

REVOLUTION, FRENCH. See **FRANCE, UNBELIEF IN.**

REYNOLDS, CHARLES B. (1832–1896), American FREETHOUGHT lecturer. Charles B. Reynolds was born in New York on August 5, 1832. His mother died giving birth to him; his father died before Charles was five. By 1868 he was an Adventist preacher. Historical inconsistencies in the Bible undermined his faith. The "ex-Reverend" Reynolds addressed his first freethought conference in 1883. Inside two years he was chair of the executive committee of the AMERICAN SECULAR UNION, a successful itinerant "liberal lecturer," and a regular contributor to the freethought papers *THE TRUTH SEEKER* and the *BOSTON INVESTIGATOR*.

Reynolds expounded a "Gospel of Humanity" whose principles were to "Do Justice, Love Mercy, Promote the Happiness of Others and thus Promote Our Own." He held "liberal tent revivals" in towns lacking halls to rent. He pitched his tent at Boonton, New Jersey, on July 26, 1886. Local churches whipped up opposition; Reynolds was arrested for BLASPHEMY, later rushed by a mob. He fled for his life, the tent a total loss. On October 13, 1886, he lectured, tentless, at Morristown, New Jersey,

and was indicted on blasphemy charges. Reynolds selected as his defender the agnostic orator and prominent attorney Robert Green INGERSOLL.

The trial was held at Morristown on May 19, 1887, amid great excitement. Ingersoll called no defense witnesses, hanging the case on his summation, a florid oration several hours long. The next day the jury returned a guilty verdict, but the judge—perhaps chastened by Ingersoll's arguments—imposed a token sentence totaling seventy-five dollars in fines and costs. Ingersoll paid this from his pocket, also forgoing any fees. The summation became a popular freethought publication.

Like the Scopes "monkey trial" argued by Clarence DARROW in 1925 (see EVOLUTION AND UNBELIEF), the Reynolds trial featured a renowned defense attorney and ended in conviction, but changed the climate of opinion so as to preclude further prosecutions of the same type.

Reynolds and his wife moved to Washington in 1889; he lectured in Walla Walla, Tacoma, and Seattle before dying in a fall at his home on July 3, 1896.

TOM FLYNN

RICKER, MARILLA MARKS YOUNG (1840–1920), American freethinker, abolitionist, suffragist, and attorney. The second of four children, Marilla Marks Young was born into a farming community in Durham, New Hampshire. Her father, Jonathan Young, was a freethinker (see FREETHOUGHT), her mother a Free Will Baptist whose religion Marilla hated even as a child. Widowed after five years of childless marriage to a rich farmer, John Ricker, she became independently wealthy at the age of twenty-eight. After four years of European travel, she settled in Washington, DC, to study law. She was admitted to the bar of the Supreme Court of the District of Columbia in 1882 and to the bar of the US Supreme Court in 1891. A notary public, in 1884 she was the first woman to be appointed a United States commissioner and examiner in chancery by the judges of the District's Supreme Court, becoming the first woman in the District of Columbia to perform quasi-judicial functions. Known as the "prisoner's friend," her wide and distinguished law practice consistently favored the poor and unfortunate. She worked hard and successfully for many prison reforms. She was the first woman to vote in the United States, fifty years before woman suffrage was legalized. As a widow of large property, Marilla Ricker, using the Fourteenth Amendment to support her cause, registered to vote in Dover, New Hampshire, in 1870 in a state election. Her vote was refused that year, but in the 1871 state election her vote received no opposition. She was Suffrage candidate for governor of New Hampshire in 1910, but the state's attorney general disallowed her candidacy. An active suffragist, she served as an officer of the National Woman Suffrage Association for many years.

A major contributor to *THE TRUTH SEEKER*, she wrote an outstanding collection of freethought essays, widely circulated in pamphlets she entitled: "*I* Don't Know. Do You?" and "*I* Am Not Afraid. Are You?" which were full of witty, down-to-earth one-liners such as: "Resolved: A steeple is no more exempt from taxation than a smoke stack" and "The presence of a hypocrite is a sure indication that there is a Bible and a prayer-book not very far away." She also wrote a book, *The Four Gospels* (1911).

Responding to anarchist Emma GOLDMAN's assertion that suffragists were too religious for the vote to do them any good, Ricker stoutly maintained that all pioneer suffragists were freethinkers. She thought it politic, however, that at suffrage conventions, parsons be allowed to "lead in prayer" ("they never lead in anything else") because they might possibly "absorb some knowledge."

Ricker died of a stroke at age eighty in 1920, the year universal suffrage was finally introduced in the United States.

RITUAL, CEREMONIAL, AND UNBELIEF. One dictionary defines *ceremony* as "a formal act or set of acts performed as prescribed by ritual or custom," but also as "a formal act without intrinsic purpose; an empty form." The tension between these conceptions is reflected among unbelievers. Some reject all ritual as a vestige of the churches or as an obstacle to freedom; others eagerly innovate to replace the rites and ceremonies cast aside when transcendental beliefs were abandoned. Reflecting that diversity of views, this entry is divided into three sections, each contributed by one or more advocates of a particular viewpoint.

OPPOSITION TO RITUAL AND CEREMONY

Prominent unbelievers have often defied what abolitionist Beriah Green called the "factitious distinctions and artificial arrangements of society," rejecting the institution of marriage; rites of passage, including baby-namings, coming-of-age observances, and end-of-life or memorial ceremonies; and holidays of the orthodox calendar. Space permits listing only a few. Ethan ALLEN, US revolutionary hero and first American author of a freethought book, was buried without religious ceremony. In 1832 reformer Robert Dale OWEN married Mary Jane Robinson in a secular ceremony administered by a notary public. Owen famously foreswore the statutory privileges of husbands over wives, stating that he and Robinson would have cohabited had the legal environment permitted it. In 1853 the first freethought association known to call itself "humanist" formed in London; members of the Humanistic Religious Association renounced the dogmas, myths, and *ceremonies* that they associated with the ancient past (see HUMANISM). Horace SEAVER, second editor of the freethought paper the *BOSTON INVESTIGATOR*, is credited by Samuel PUTNAM with being the first to cast aside a formal, ritualized funeral when his wife died in middle age, substituting a "social funeral" marked by the informal exchange of fond memories. Free-love activist Ezra H. HEYWOOD and novelist Sinclair LEWIS were among several nineteenth- and twentieth-century unbelievers whose wills forbade a religious memorial ceremony. Like many freethinkers of their generation, *TRUTH SEEKER* associate editor Woolsey TELLER, *Truth Seeker* editor James Hervey JOHNSON, and German-born US rationalist activist Walter HOOPS directed that no memorial service be held after their deaths, an appeal Hoops's Missouri admirers disregarded.

Unbelievers who scorned the ceremonial seldom wrote about their decisions, leaving us to guess at their motives. No doubt some acted from reflex, rebuffing social conventions associated with rejected religious traditions. Others gave signs of more sophisticated rationales, rooted in the French Enlightenment (see ENLIGHTENMENT, THE, AND UNBELIEF) and individualist anarchism (see ANARCHISM AND UNBELIEF).

French Enlightenment thought cultivated an unprecedented individualism that sought to burst fetters of religion, state, and social convention. The sex radicals of the later nineteenth century (see SEX RADICALISM AND UNBELIEF) built upon this, reinterpreting traditional concepts regarding sexual relations, marriage, the family, and their associated rituals in light of their own personal judgments.

Still more radical individualism was expressed by the transcendental idealist Johann Gottlieb FICHTE. Fichte vested supreme value in the "I," the individual exercising will; the "I" enjoys maximal freedom only by releasing itself from all constraints, including those implied by ceremonial. Anarchist philosopher Max STIRNER went further, asserting in *The Ego and Its Own* (1845) that no one is free so long as "there still exists even one institution which the individual may not dissolve." On this view, individual development consists primarily in emancipating oneself from the nested tyrannies of family, village, state, and church, necessarily rejecting the rites and ceremonies through which those institutions customarily mediated or constrained individuals' life choices.

Late nineteenth- and early twentieth-century anarchists embraced these principles passionately and articulately, leaving some of the most coherent accounts of lives deliberately purged of ritual. Unconventional living arrangements and the avoidance of matrimony were common among them. US anarchist and freethinker Emma GOLDMAN lived communally or with lovers during her most active years. Her anarchist colleague Voltairine DE CLEYRE forswore not only matrimony but even committed relationships; rejecting lover Samuel Gordon in 1897, she wrote to him that she would rather be alone than "be the slave of my own affection for you." Regarding the disposition of her body after her death she wrote, "I want no ceremonies nor speeches over it. I die, as I have lived, . . . owing no allegiance to rulers, heavenly or earthly." For De Cleyre, a memorial rite would unacceptably affirm the power of society, state, or church to determine *for the individuals who mourned her* what her life had meant.

Through the years, some unbelievers have consistently rejected ritual and ceremonial not simply as vestiges of religion, but as vestiges of a pre-Enlightenment, authoritarian social order that is inimical to individual autonomy and self-actualization.

Opposition to Holiday Observances. Unbelievers also vary in their attitudes toward observance of traditional holidays, particularly those of religious origin. Philosopher George SANTAYANA and playwright George Bernard SHAW conspicuously refused to celebrate Christmas. Others, including atheist campaigners Madalyn Murray O'HAIR (US) and Barbara Smoker (UK), defended the holiday, arguing that its pagan and secular heritage outweighs its religious cargo. This author dissented in 1993, arguing that while much about Christmas observance is nonreligious, the holiday is so deeply associated with Christianity that unbelievers risk being perceived as hypocrites when they observe Christmas, or even an alternative holiday like the Winter Solstice or HumanLight. Additionally, if unbelievers can benefit socially and politically when their true numbers are acknowledged, refusing to celebrate Christmas enhances unbelievers' social visibility. In contrast, conventional holiday observance reduces that visibility, perversely supporting the myth that Christianity is ubiquitous at holiday time.

In the view of some unbelievers, a thoroughgoing individualism requires the firm rejection of any ritual,

ceremonial, or holiday observance that might affirm arbitrary limits on individual autonomy.

EMBRACE OF RITUAL AND CEREMONIAL

Though some nineteenth- and early twentieth-century freethinkers rejected the practice of ceremony in their lives, many others assuredly did not. Today's celebrants, such as those affiliated with the ETHICAL CULTURE movement, the AMERICAN HUMANIST ASSOCIATION, and the Celebrant USA Foundation and Institute, trace their influences to earlier thinkers who looked for ways to express their exuberance and their sense of solidarity after having been released from the stultifying traditions of conventional religions.

In the 1850s in France, for example, August COMTE, who had developed the science of sociology in order to bring progress to humankind through the application of reason, founded the Positivist Church, a "religion" energized by a celebration of humanity, but divested of anything metaphysical (see POSITIVISM). The idea spread to other European countries including Holland, Norway, Great Britain, and Germany, where the best known of the new organizations was named the Free Religious Society. Though they had not freed themselves from ecclesiastical terminology, these movements sought to provide the human benefits of close-knit community, ceremony, and celebration without the trappings of theism.

In 1876, very much from this tradition, Felix ADLER founded the Ethical Culture Society in New York as an agnostic religion. Adler saw ethics as replacing theology and superstition, but nonetheless retained an acceptance of "spirituality" in the sense of acknowledging some unknowable force for good in the universe. Today, this view has been replaced by naturalistic HUMANISM, although the structure of the society remains congregational, with ceremonies conducted by the society's trained leaders.

The American Humanist Association, founded in 1941, first began certifying celebrants in 1964 under what was then the Division of Humanist Counseling (now the Humanist Society). Much influenced by humanist psychologists at the time, the celebrants still see ceremony as a response to human needs, but also as a way to make manifest and strengthen the bonds of the human community.

To protect the ceremonial rights of secular people, in 1973 Australian humanist and rationalist attorney general Lionel Murphy initiated the world's first program for independent civil celebrants appointed by the state. The International College of Celebrancy, based in Australia, certified its first US celebrants in 2001. The Celebrant USA Foundation and Institute has continued this work, certifying students for careers as civil celebrants. Their mission is to provide students with extensive training in the theory and practice of ceremony, so that they might work closely with clients to create beautiful and highly personalized ceremonies that reflect the clients' values, traditions, and tastes.

The Purposes and Benefits of Ceremony. Practicing celebrants see many practical benefits to ceremony. For the unbeliever, ceremony is seen as a human contrivance, though one with the potential to boost the health and enrich the lives of individuals while increasing the strength and cohesiveness of community. It is a chance for people to draw together in order to communicate what is meaningful; to express thoughts and emotions through the arts; to state, transmit, and reinforce values; to recognize milestones that mark personal histories; to measure progress; to acknowledge achievements; to honor the distinctiveness and worth of each individual; to proclaim love or admiration; to face transitions with courage; to share happiness and grief, laughter and tears; and to party with those closest.

Today's celebrants are asked to perform ceremonies that fall into three general categories, recognizing common patterns of life experience—rites of passage (baby welcomings, coming of age, weddings/commitments, end of life), seasonal or annual (HumanLight, anniversaries), and event-specific (graduations, recovery from illness, divorce, opening of a new business). The structure of ceremony allows participants to focus in on their lives at the present moment, review the past, and approach the future with renewed determination and the support of family and friends. Ceremony reduces isolation and alienation by allowing participants to see their lives as part of the story of all humankind.

The best ceremonies appeal to all aspects of human nature—the senses, the imagination, the emotions, and the intellect. Putting together a ceremony can be seen as a rational process, which brings clarity, order, and self-

reflection to our busy, scattered lives. And ceremony serves the humanist ideals as expressed in the Council for Secular Humanism's "Affirmations of Humanism" (to strive for "the fullest realization of the best and noblest that we are capable of as human beings") and the American Humanist Association's "Humanism and its Aspirations" ("the joining of individuality with interdependence" in creating "lives of personal fulfillment").

However, ceremonies need not appeal to everyone. Contemporary celebrants agree there should be no established orthodoxy of belief or practice, but rather an open set of choices. Unbelievers should be wary if ceremony replaces the rightful function of rational inquiry or settles into some rigid form of required participation. Rather, to contribute to the vitality of each humanist community, ceremony has to be constantly rethought and reinvented, personalized for each individual, family, generation, and nationality.

EMBRACE OF HOLIDAY OBSERVANCE

Humanism is much more than just a rejection of supernatural beliefs and the practices based on those beliefs. It is a framework for a good life and a path to peace and justice. Public humanist celebrations, including a recently developed holiday called HumanLight, hold great potential to further these psychological, moral, and practical ideals of humanism.

As Aristotle noted, we humans are social animals. We thrive when we participate in community and relationships. However unfortunately or unjustly, in most of the world today community and family life are structured to a great extent around theistic religious traditions. Participation is limited or forbidden for those who are unwilling to act as if they share predominant religious beliefs.

So long as unbelievers are unwelcome as full participants in many community and family gatherings, aspects of their psychological needs for social connectedness can only be satisfied by specifically humanist social events. Although most humanist organizations provide regular occasions for people to get together to educate themselves and to discuss intellectual issues of importance, these cannot suffice. Any human community will consist of those who are too young to participate and those who are not attracted to these types of intellectual activities.

Periodic gatherings to celebrate and commemorate humanism create opportunities for the entire community to come together. Relationships among individuals and families can be established, maintained, and strengthened in an open, welcoming, and relaxed atmosphere. The HumanLight holiday in particular is a promising candidate for a humanist celebration that can grow to be highly popular and well known. The first HumanLight event occurred in 2001 in the New York metropolitan area, and in the few years since has been conducted in dozens of locations around the United States.

HumanLight is December 23, and is celebrated on or near that date. Although some object to the proximity of HumanLight to Christmas and other religious holidays, the reality in many societies is that the culture carves out this period of time both structurally and psychologically as an occasion for celebration and contemplation of life's deeper meanings. It is, from a pragmatic point of view, an excellent opportunity to hold a large social gathering. Furthermore, a major event at this time of year can alleviate feelings of alienation and isolation from society.

By bringing our children to gatherings that celebrate humanism, we convey to them our commitment to its ethical principles. These social events can impress upon young minds the importance of humanist principles in unique and influential ways, and can help create the emotional foundation for a lifelong commitment to humanism.

Humanists also want to provide a public hearing for our ideas so that they may be considered in social and political decisions, and we want to reach out to those people who are humanists at heart but do not know that humanist groups exist. Celebrations such as HumanLight, when publicized, are an excellent positive way to let the public know that humanist organizations exist and provide an important alternative approach to confronting life's critical questions.

There are dangers associated with ritualized celebrations, and these must be acknowledged. But we can weave this awareness into the fabric of the celebration itself to minimize these risks. Likewise, it must be understood that the idea of holiday celebrations does not appeal to all humanists. Nonetheless, given the great value that many humanists have already found in HumanLight and the potential of such events for raising public awareness of humanism, all humanists should be able to support HumanLight and other such celebrations.

Gary Brill and Joe Fox

ROALFE, MATILDA (1813–1880), English activist and bookseller. After working with George Jacob HOLYOAKE and the London Anti-Persecution Union in the 1840s, Matilda Roalfe decided dramatically and personally to challenge British blasphemy laws. Her colleague Thomas Paterson had opened up a bookshop to sell banned books in Edinburgh in 1843, for which he was arrested, tried, and imprisoned. Thomas Finley next took over the shop, and was likewise arrested, convicted, and jailed. In 1844, Roalfe traveled to Edinburgh, where she reopened the Atheistical Depot at 105 Nicolson Street to offer for sale a list of persecuted books, such as those by Thomas PAINE. Roalfe publicized her crime in a sixteen-page tract, "Law Breaking Justified" (1844). She wrote that "to resist bad laws, is no less duty than to respect good ones." She pledged to "publish irreligious opinions," regardless of the consequences. She was arrested, convicted, and spent sixty days in jail. True to her word, she continued her blasphemous bookselling upon release from prison. She later married and settled in Scotland.

ANNIE LAURIE GAYLOR

ROBERTSON, JOHN MACKINNON (1856–1933), English freethought historian. John Mackinnon Robertson was one of the major rationalist writers of the late nineteenth and early twentieth centuries (see RATIONALISM). As well as being active in the FREETHOUGHT movement, he was a successful Liberal politician and a prodigiously industrious researcher and writer.

Robertson was born on the Isle of Arran in Scotland. Having left school at thirteen, he was largely self-educated—he continued a process of study until his death. As a young man he moved to Edinburgh, where he became a journalist and then assistant editor of the Edinburgh *Evening News*. He was active in the Edinburgh Secularist Society and was inspired when he heard Charles BRADLAUGH speak. Annie BESANT persuaded him to move to London and work for Bradlaugh's *National Reformer*, of which he became assistant editor.

On the death of Bradlaugh in 1891, Robertson took over the editorship, but the publication survived only until 1893. He next founded the progressive and literary journal *Free Review*, which he edited until 1897. Some thought him likely to take over leadership of the NATIONAL SECULAR SOCIETY, but the majority favored the more populist G. W. FOOTE. He shared many secularist views, describing himself as "Republican, Atheist and Malthusian." He also opposed compulsory vaccination and favored free speech, being a member of the Free Defense Committee that defended the publication of Zola's *La Terre* and Havelock Ellis's pioneering book on homosexuality, *Sexual Inversion.*

He sought election to Parliament, succeeding in 1906, and stood as a Liberal for the constituency of Tyneside. He had already been active in politics, having visited South Africa at the time of Boer War; at that time he criticized British imperialism and the institution of concentration camps. He later argued for self-government in India and Egypt. He was made parliamentary secretary to the Board of Trade in Asquith's government in 1911 and became a member of the Privy Council in 1915. He failed to win reelection in 1918.

Robertson wrote more than one hundred books and numerous articles, not all of which have been documented. Two works may be considered his masterpieces: *A Short History of Freethought* (1899), two substantial volumes published throughout his working life in many reprints and revisions; and *A History of Freethought in the Nineteenth Century* (1929; also two substantial volumes and frequently reprinted). He was interested not only in individual freethinkers but in the process whereby freethought developed historically. His style is dense and dry, but it is hard to imagine this topic better covered. He saw the development of freethought ideas as a constant contest, an ebb and flow, but ultimately showing "a law of evolving reason."

Other areas of great importance in his writing were Shakespeare studies, the historicity of Jesus (see JESUS, HISTORICITY OF), and the development of Christianity. He argued that Shakespeare's plays contained many insertions by other writers, a thesis that dented his admiration for Shakespeare's plays not in the least.

It was of a piece that he doubted the existence of Jesus, in particular thinking that some of the New Testament contained insertions from a morality play. His belief in the power of myth reinforced these views. The morality play theory is not now accepted, but the possibility that Jesus had no actual existence is still put forward by scholars such as G. A. Wells.

Robertson wrote about the development of Christianity, believing its success to be due to good organization and—once it had become a ruling religion—the power of the state. The development of all religions in his view followed a pattern, which he explored in his book *The Dynamics of Religion.* He was one of the earlier figures to bring a sociological approach to much of his writing.

His reputation has not been sustained except among specialists. His lack of academic qualifications and his position as a secularist activist probably told against him. However no one who played such a large part in the rationalist cause also had such a prominent political career. When he died he possessed more than twenty thousand books; given his extraordinary industry it could be believed he benefited from them all.

JIM HERRICK

ROBINSON, CHARLES (1818–1894), American politician and freethinker. Passing his childhood and early years in rural Massachusetts, Charles Robinson graduated from the Berkshire Medical School and practiced medicine for a few years before joining the gold rush to California in 1849. Passing through what would become Kansas Territory, Robinson would remember its promise for future settlement. After the passage of the Kansas-Nebraska Act that opened the territory, Robinson became active in the New England Emigrant Aid Society, "an organization with a moral mission that intended to make a profit through real estate speculation." The city of Lawrence was established by the society as a center of the Free State movement, which opposed the expansion of slavery. Robinson served as president of the town company, and became a founder of the Free State Party in 1855.

During the conflict that ensued, Robinson was arrested on the charge of treason in May 1856, and was jailed for four months. Pro-slavery forces from Missouri burned and sacked Lawrence on May 21, which in turn led to armed resistance led by Captain John Brown. Robinson participated in the foundation of the town of Quindaro, on the Kansas side of the Missouri River, in what is now Kansas City, Kansas. Quindaro became a "station" on the Underground Railroad, but after an economic depression began in 1857, the town's growth faltered.

When Kansas was admitted to the Union as a free state in 1861, Robinson served as the first governor, but served just one term due to controversies concerning the alleged improper sale of bonds. The flamboyant Gen. James H. Lane was a determined adversary of Robinson's in the turmoil of Republican Party politics at the outset of the Civil War. Robinson was impeached in the Kansas legislature in connection with the bond sale charges, but was acquitted at trial. Later he participated in the establishment of the University of Kansas in Lawrence and served as its chancellor.

Robinson was active in opposing the movement to declare the United States to be a Christian nation that arose in the 1870s. The NATIONAL LIBERAL LEAGUE, of which Robinson was a state leader, claimed to have more than two hundred local groups in Kansas by 1879. The Liberal League opposed "the use of the Bible in public schools, the public support of sectarian schools and charitable institutions, the official recognition of religious holidays, and the judicial oath." Robinson promoted liberal encampments and spoke at these, saying in 1879 that "the old time theological barricades erected around the most ignoble of superstitions is fast crumbling into dust. A decade more and they will all have vanished from before the advancing footsteps of enlightened civilization, and in place of the altar of sacrifices to unknown Gods or a triumvirate of Gods and deities, will be erected a monument to the most beautiful of all faculties, Reason!" But by the early 1890s, the Liberal League in Kansas "ceased to function as anything more than a loosely knit intellectual society with exchanges of correspondence between a few members."

To mark the 150th anniversary of the founding of the city of Lawrence, the Free State brewery there produced Governor Robinson's Lager.

FRED WHITEHEAD

RODDENBERRY, GENE (1921–1991), American television producer, creator of *Star Trek*. The "father" of the television phenomenon *Star Trek*, Eugene Wesley (Gene) Roddenberry was born in El Paso, Texas, to a cavalry officer, Eugene Roddenberry, and a housewife, Carolyn (Golemon) Roddenberry. His mother insisted on a religious upbringing for young Gene, with church and Bible studies very much a part of his daily life (although his father generally ignored religion). As a young teen, however, Gene gradually realized that most of religion, and Christianity in particular, with its rituals, "thou shalts," and "thou shalt nots," was alien to him. "I've been set down here among cannibals!" he protested after realizing the literal implications of eating Christ's "body" and drinking Christ's "blood."

Early Life. Gene Roddenberry was the oldest of three children. When Gene was only two, his father moved the family to Los Angeles, where he became a policeman. A decorated World War II fighter pilot, Gene joined Pan American Airways after the war. By the early 1950s he quit being a "bus driver in the sky," and with his wife and two young daughters relocated to Los Angeles, pursuing the family tradition of police work. Walking a beat by day, moonlighting as a speech writer for Police Chief William H. Parker, Gene still found time to write scripts for the new medium of television. Soon he was earning considerably more as a writer than as a police officer, and he resigned from the LAPD.

***Star Trek* Is Born.** After many years of writing for top TV series like *Dragnet* and *Have Gun Will Travel*, he

created his first series, *The Lieutenant* (1963–64). This was followed by *Star Trek* (1964). *Star Trek* wasn't an easy sell; studios thought it "too cerebral," but eventually Desilu took a chance on the fledgling series. The show aired on NBC for three years, from 1966 to 1969, and was a critical failure. It was only during syndication that it became a phenomenon. In 1979 Roddenberry produced *Star Trek: The Motion Picture.* During his lifetime, there were several more films and a spin-off series, *Star Trek: The Next Generation.*

Roddenberry's Humanism. An agnostic most of his life, Roddenberry insisted that *Star Trek* be free of religion's "petty superstitions," refusing to put a chaplain onboard the starship *Enterprise* in both the original series and *Next Generation.* When fellow science fiction writer Isaac Asimov (then honorary president of the American Humanist Association) sent Roddenberry some literature in 1988, he became an avid humanist, realizing this had been his personal philosophy most of his life.

Roddenberry died on October 24, 1991, at the age of seventy. He was survived by two daughters; his first wife, Eileen; his second wife, *Star Trek* actress Majel (Barrett) Roddenberry; and their son.

Following his death, *Star Trek*'s producers chose to ignore his unbelief and humanism in favor of more mysticism, especially evident in the spin-off series *Star Trek: Deep Space Nine.*

ROGERS, J. A. (1883–1966), American anthropologist and humanist. Joel Augustus Rogers was born in Negril, Jamaica, in 1883. He immigrated to the United States in 1906 and became a naturalized citizen in 1917, the year he self-published his first book, *From Superman to Man.* He spent more than fifty years researching black history throughout the world. He was an anthropologist, historian, and journalist, visiting some sixty countries without institutional funding or support of any kind. He was largely self-taught, teaching himself French, German, Spanish, and Italian.

During his childhood, Rogers learned about the so-called myth of Ham, the belief that in Old Testament times blacks were cursed by God to be servants of whites. He was taught that blacks had produced no worthwhile civilization, and that they were in almost every way inferior to whites.

Rogers delved into ancient history to prove otherwise. He collected rare photos of statues and paintings of African pharaohs, black gods and goddesses, and so forth. He argued that "there is but one race, the human race," and showed that the various peoples of the world have been mixing since antiquity.

Rogers was an atheist (see ATHEISM) and he was especially critical of the Church of Latter Day Saints (Mormons), considering their religion to be especially racist. He wrote that the LDS Church taught that God had cursed blacks, doomed them from birth, and would never allow them to enter heaven.

Rogers was sympathetic toward Islam, but he thought Christianity in general was harmful to blacks. While blacks were praying for pie in the sky, many whites were enjoying heaven on earth. He thought Christianity made many blacks apathetic to their plight. He believed that people of African descent would do well to pay less attention to the teachings of Christ and more attention to Friedrich NIETZSCHE.

Rogers published many more books, including the three-volume *Sex and Race*, *Nature Knows No Color Line*, *One Hundred Amazing Facts about the Negro*, and *Africa's Gift to America.* His writings influenced some of the most influential blacks of the twentieth century, including Hubert H. HARRISON, W. E. B. Du BOIS, Malcolm X, and Haile Salassie.

ROJAS, FERNANDO DE (1473?–1541), Spanish writer and playwright. Fernando de Rojas was probably born in La Puebla de Montalban, province of Toledo. He was of Jewish descent; presumably his great grandfather had converted to Christianity to avoid deportation. Fernando thus belonged to a converted family, so he was among the so-called new Christians—ancestrally Islamic or Jewish Christians whose sincerity of conversion was often doubted.

Around 1488 Rojas journeyed to Salamanca, site of the most prestigious Spanish university. There he studied Latin, philosophy, and other subjects for at least six years, aiming to earn his Bachelor of Law degree. At the time he wrote the last fifteen "acts" of his only known play—which was published in 1499 as *The Comedy of Calixto and Melibea.* However, many scholars attribute the first act of this work to Juan de Mena or Rodrigo de

Cota. Some years later, he added five further acts to the sixteen of the original play, titling the revised work *Tragicomedy of Calixto and Melibea*. Calixto and Melibea were star-crossed lovers brought together by La Celestina, a wicked and callous matchmaker who was not above employing black magic. La Celestina dies, stabbed, near the end of the play; Calixto and Melibea die also, in a way much like William Shakespeare's Romeo and Juliet.

What Rojas called "acts" in his play would later be known as "scenes." Many caused scandal, because he openly treated physical love and lust. Calixto even exalts his love for Melibea as being greater than any love he can feel toward God, going so far as to call Melibea his goddess. This was dangerous in a Spain that hunted down and killed former Jews regarded as less than true converts. (As recently as the 1950s, the play was banned as "immoral" in Mexico City.)

In 1507, following costly litigation brought against him by one of his neighbors, he settled in Talavera de la Reina, where he worked as a lawyer until the end of his days. There he married Leonor Álvarez de Montalbán, also a descendant of Jewish converts. She gave him seven sons and daughters who survived to adulthood. His first son chose his father's career at law. About 1538 Rojas became the mayor of Talavera.

Rojas died in 1541, never suspecting that his play—soon to be known as *La Celestina*—would became one of the great masterpieces of Spanish literature. The play ushered in the so-called Golden Century, during which few if any topics were too sensitive or controversial for literary treatment, paving the way for works such as Cervantes's *Don Quixote*, written more than a century after *La Celestina*.

Scholars have debated whether Rojas was truly a conspicuous convert scorned by an intolerant society. His last will and testament portrays him as a respected and vastly wealthy man, apparently well accepted in society. Though many suspected that he was never a true Catholic, he was careful enough never to give away any sign that might have compromised him with the Spanish Inquisition.

MARIO MENDEZ ACOSTA

ROSE, ERNESTINE L. (1810–1891), American freethinker and women's rights activist. Blasted by ministers and newspaper editors as a "female devil" for speaking in public on freethought and women's rights, Ernestine L. Rose was one of the major intellectual forces behind the women's rights movement in nineteenth-century America. Yet today virtually no one knows her name.

Ernestine Potowski was born in Poland on January 13, 1810, of Jewish parents. By all accounts, she was a precocious child who learned Hebrew scriptures at an early age and chafed at her father's strict religion. Leaving home at seventeen, Ernestine ended up in London, where she became a disciple of Robert OWEN in the early 1830s and met her husband, William Rose, also an Owenite reformer.

In May of 1836 Ernestine Rose and her husband sailed to New York City to begin their married life in a country that promised equality to all under a Declaration of Independence. Within only a few months of her arrival, Ernestine was speaking to groups of New Yorkers about "Mr. Owen's system" while William opened a jewelry repair shop to help support her efforts. She spent her first decade in the United States lecturing on traditional Owenite concerns: the harm of private property, the evils of organized religion, the importance of education and freethought, and the significance of women's rights. Rose's first cause was the Married Women's Property Act: she spent her first winter in New York gathering signatures to support legislation that would allow married women to retain their own property after marriage.

By the 1840s Rose was increasingly dedicated to the intertwined issues of women's rights and FREETHOUGHT. She believed, as Robert Owen had before her—until he converted to Christian mysticism in his old age—that organized religion and the capitalist economic system were the root causes of women's inequality with men. Multilingual in a variety of ways, Rose was equally at home on the stage with "infidels" such as Robert Owen and Benjamin OFFEN, with woman's rights activists such as Elizabeth Cady STANTON and Susan B. Anthony, or with abolitionists such as William Lloyd Garrison.

Beginning in 1850, Rose helped organize the woman's rights conventions—both national and local—that were held throughout the 1850s and some of the 1860s, until the war intervened. An experienced speaker, unlike many other women in the movement, Rose was often a president or vice president of these conventions, and, as the movement grew, Rose became known as one of its greatest orators. As Susan B. Anthony reminisced, when Ernestine Rose was on the stage, "we all felt safe."

At the end of the Civil War, Rose joined her friends Susan B. Anthony and Elizabeth Cady Stanton to create the National Woman's Suffrage Association, an association dedicated to obtaining the franchise for women. Though the women's rights movement would splinter in 1869 over just who (women or black men) would get the right to vote, Rose's position never faltered, just as she never used the racist rationales that plagued the efforts of speakers like Anthony and Stanton. To Rose, the Declaration of Independence said it best: "We desire," wrote Rose in 1863, "to promote human rights and human freedom. In a republic based upon freedom, woman, as well as the Negro, should be recognized as an equal with the whole human race."

Ernestine and William returned to England in 1869, when the women's rights movement split apart. They spent the rest of their life in England, watching their expenses, as they had both devoted themselves to furthering an idea of individual freedom, not to making for-

tunes. Despite her importance to the women's rights movement, Ernestine Rose, who died in 1891, is perhaps the most forgotten of the women's rights activists. Her disappearance from history is telling. Not only was she scorned by newspaper editors and ministers, she was also isolated from and sometimes ignored by the very women and men with whom she shared reform platforms. Rose was outspoken, ironic, and, perhaps the most important, a freethinker who was born Jewish in Poland. In a movement that drew much of its moral and intellectual energy from appeals to Christian piety, Rose's atheism, her foreign accent, and her outspoken ways rendered her an "other" in a movement of others.

CAROL KOLMERTEN

ROSS, WILLIAM STEWART (SALADIN; 1844–1906), Scottish freethought journalist and poet. William Stewart Ross was born on March 20, 1844, in the Scottish county of Dumfries, the son of a farmhand. Coming from such modest beginnings, he was fortunate to receive any education at all, much less a university education. After going to New Abbey Parish School, Ross was sent to Hutton Hall Academy, where he studied and worked as an usher. His abilities were apparent by this time and he was able to go to Glasgow University, where he studied theology with a view to becoming a clergyman. But during the course of his studies he lost his Christian belief and became a convinced freethinker (see FREETHOUGHT).

Ross began earning his living as a journalist. In the fashion of the day, he wrote a novel which ran in serial form in the *Glasgow Weekly Mail*. He soon moved down to London, where in 1872 he set up a publishing business, specializing in educational books and magazines. But against the run of his business interests, Ross also became increasingly involved in the freethought movement.

While Ross had rejected religion, he was strongly opposed to taking up a hostile position against religion on all matters. He was also opposed to identifying the movement with ATHEISM. This put him on a collision course with Charles BRADLAUGH, who championed atheism as a moral rejection of the transcendental temptation. Also Ross was not a man willing to share the limelight, which ensured a further poisoning of relations with the better-known Bradlaugh. In 1880 Ross collaborated with Charles WATTS to coedit the *Secular Review*. Watts and Bradlaugh had parted ways in 1877 over disagreements as to the best course of action in a widely publicized legal action over their publication of a pamphlet in favor of birth control (see BIRTH CONTROL AND UNBELIEF). In 1884 Ross took ownership of the journal, which in 1889 he renamed the *Agnostic Journal and Secular Review*. Ross's own contributions were under the pseudonym of "Saladin," the great Muslim nemesis of the Christians.

Ross also collaborated in the short-lived British Secular Union (BSU), a freethought movement set up in 1878 largely by Charles Watts as an anti-Bradlaugh freethought vehicle. The figurehead of the BSU was the quixotic Marquis of Queensbury, who is better known for his virulent hatred of Oscar Wilde and his development of what are now known as the Queensbury rules of boxing. The BSU was already moribund when Charles Watts left for Canada in 1886 (see CANADA [ANGLOPHONE], UNBELIEF IN).

Ross allowed his intense dislike of Bradlaugh to cloud his judgment when in 1888 he collaborated in the publication of a scandalously libelous biography of his enemy. In subsequent lawsuits it was determined that Ross had assisted the nominal author, Charles McKay, with an unpublished manuscript he had already prepared, and with other material. Ross and McKay subsequently fell out and a costly legal battle ensued between them as well as between Ross and a justly aggrieved Bradlaugh.

Throughout his turbulent career, Ross kept up a steady stream of freethought writing, much of which began life in his *Agnostic Journal* and ended up published in book form. Notable titles include *God and His Book* (1887), *Roses and Rue* (1891), and *Woman: Her Glory and Her Shame* (1894). He was awarded a gold medal for the best poem on Robert Burns at the unveiling of a statue to him in 1879. Ross's contribution to freethought is enigmatic. He was fiercely opposed to Bradlaugh's atheism, though his own writing was far more incendiary than Bradlaugh's. But at his best, Ross produced some of the finest writing, both prose and poetry, in the service of freethought. He died on November 30, 1906.

BILL COOKE

ROUSSEAU, JEAN-JACQUES (1712–1778), Swiss writer, musician, philosopher, and romantic. Jean-Jacques Rousseau's writings on religion offended both the Catholic authorities of Paris and the Protestant leaders of his native Geneva, forcing him to flee from both cities. However, he also quarreled bitterly with his fellow Encyclopedists VOLTAIRE, Jean le Rond D'Alembert and Denis DIDEROT (see also *ENCYCLOPÉDIE, L'*, AND UNBELIEF) over the proper role which religion should play in human affairs. He thus cannot be considered an unbeliever, but his works did much to help break the hegemony of Christianity over Western thought; also, his advocacy of a simple life was a precursor to the modern environmental movement.

Life. Rousseau was born in Geneva, Switzerland. His father was an itinerant watchmaker, his mother the child of a Calvinist cleric. She died a few days after giving birth to him, and as Rousseau puts it in his infamous *Confessions* (in which he goes into excruciating detail about the private facets of his life), "So my birth was the first of my misfortunes." There would be many more to come. He was to lead an erratic existence: orphaned at the age of ten, brutalized as an apprentice to an engraver in his teens, and finally wandering away from Geneva after discovering the city gates were closed to him when he returned from one of his frequent nature rambles. Rousseau found protection in the home and bed of Mme. De Warens in Turin, Italy. He became so attached to her that he abjured his Protestant religion and converted to Catholicism in her honor, although he was later to reconvert back to Calvinism in 1754 during a futile attempt to settle down in Geneva once more. For the rest of his life he would wander from one European city to another, usually living off the largesse of aristocrats who agreed theoretically with his denunciations of inherited wealth, and attempting to provide for his common-law wife Thérèse Le Vasseur, an illiterate serving girl with whom he had five illegitimate children. While himself a philosopher of education, Rousseau never put into practice any of his pedagogical views on his own children, as he sent them all to foundling homes upon their birth. He initially hoped to have a career as a composer and music theorist, and his opera *Le Devin du village* (The Village Soothsayer) was successfully performed before King Louis XV. He was invited to write articles on music for the *Encyclopédie*, the great compendium of human knowledge being edited by Diderot and D'Alembert. In 1750 he won an essay contest sponsored by the Academy of Dijon which helped to make him a well-known figure in France. However, his subsequent writings were denounced by the Catholic Church, causing him to return to Geneva, where he quickly offended the Swiss ecclesiastics. He then fled to London, and was for a time the guest of the noted freethinker David HUME, but his increasing paranoia led to a public break between the two. Rousseau eventually came back to Paris, where he was protected by the powerful marquis de Girandin, at whose estate he died in 1778. One of his visitors there was a young lawyer named Maximilien Robespierre, who would later credit his revolutionary political views to Rousseau's influence, and who would make it a point to extol the need to believe in a Supreme Being, sharing Rousseau's dislike of the materialism (see MATERIALISM, PHILOSOPHICAL) of the Encyclopedists.

Writings. Rousseau's award-winning essay of 1750 set the tone for his later writings. The question asked by the Dijon committee was whether the increasing role of the arts and sciences in human affairs had contributed to the betterment of society. Rousseau was the only one not to answer in the affirmative, marking his break from the Enlightenment RATIONALISM of his peers and demonstrating his advocacy of what came to be called Romanticism—the view that human affairs should be connected with emotional rather than rational support systems. His brilliant writing style nonetheless won him the prize, even though his conclusion was diametrically opposed to the views of both the Academy of Dijon and his fellow Encyclopedists. However, his defense of the natural goodness of human beings was also in direct opposition to the Christian concepts of original sin and the fall from grace. In his later works, Rousseau postulated an original primitive state of existence, where humans lived together in harmony, their happy way of life based upon innate feelings of compassion for their fellow creatures. This idyllic world (which he admitted was purely hypothetical) came to an end with the rise of a settled agricultural society and an emphasis upon property rights, which divided people into haves and have-nots. Social inequalities arose, and civilization—rather than taming savages, as the common view would have it—was the means by which the masses were trained to accept their lots in life, respect the landowners and aristocrats who kept them from having sufficient food or shelter, and worship a God who presided over the despotic situation. "Man is born free," he wrote, "but everywhere is in chains." Modern society has taught humans to despise themselves and find their self-worth through adhering to artificial customs, rather than to appreciate their true natures.

Education. Given his strong condemnation of existing social structures, it is not surprising that Rousseau developed a prescription for the woes of humanity. It would not be possible to return to the Golden Age of the past, when all lived together simply and in peace, but one can try to avoid the corruptions of modern-day cultures by proper educational techniques. He delineated these in his much-debated books *La nouvelle Héloise* (1761) and *Émile* (1762), the latter becoming one of the most influential works in the philosophy of education. Children should be raised alone, rather than in common schools, and their emotional development should be the primary concern. Books should be eschewed, as these interfere with the direct contact with nature. Even the Bible should be avoided until at least the teenage years. The only exception Rousseau allowed was Daniel Defoe's *Robinson Crusoe*, since this book taught the importance of self-reliance and human resourcefulness. While critical of current educational practices, he still adhered to the rigid separation of the sexes, arguing that woman's nature was different from that of man's, and she should be trained to be a helpmate, not an equal. Mary WOLLSTONECRAFT, although deeply influenced by *Émile*, was to take Rousseau to task for not being radical enough in his social views. In her 1792 *A Vindication of the Rights of Women* she argued forcefully for coeducation and equal opportunity for women.

Perhaps the most controversial part of *Émile* was a long section titled *Profession de foi du vicaire savoyard* (The

Profession of Faith of a Savoyard Priest). It is an account of a cleric who in old age pens his memoirs, which describe how he never really believed in the austere and antierotic Catholic worldview. The work extols the virtue of nature, and argues that traditional orthodox beliefs—both Catholic and Protestant—are an affront to the name of the Deity, who has provided a world where all creatures have room to roam and plenty to eat. It was this section of *Émile* that particularly enraged the religious authorities of the time.

Religion. While criticizing the supernatural aspects of Christianity, Rousseau made it quite clear that he did not consider himself to be either an atheist or a materialist. In his 1762 *Contrat social* (The Social Contract) he went so far as to advocate a "Civil Religion" which would unite all members of a society under one belief system. He always expressed great respect for the moral teachings of Jesus, but could not accept the idea of the incarnation and original sin. And while he agreed with many of the Encyclopedists that the ancient philosophy of Epicureanism, with its emphasis on pleasure as the highest goal for human beings, needed to be revived, he nonetheless distanced himself from the view that hedonism meant the satisfaction of mere physical desires. For Rousseau, humans have a spiritual nature as well, which likewise needs to be satisfied. The organized religions of Christianity have perverted this by directing their attentions to dogmatic rivalries and through despising the natural world, but a true religion of humanity, he felt, was a real possibility once human beings finally broke away from artificial constructs. Finally, again unlike many of the freethinkers of his own time, Rousseau refused to give up a belief in an afterlife.

The study of Rousseau's philosophy can be frustrating, as he frequently seems to contradict himself, at times appearing to be almost an anarchist, at other times appearing to advocate a totalitarian system of government. But he himself claimed that he would rather be a man of paradoxes than a man of prejudices. His rich body of work and his personal example as a seeker of truth and iconoclastic shatterer of orthodoxies made him a major figure in the history of ideas.

TIMOTHY J. MADIGAN

ROY, MANAVENDRA NATH (1887–1954), campaigner for social justice, international revolutionary, freedom fighter, and a major leader of the Indian humanist movement (see INDIA, UNBELIEF IN), M. N. Roy was one of the most extraordinary figures of the twentieth century. He was born Bhattacharyadranath Bhattacharya on March 21, 1887, in the village of Arbalia in the province of West Bengal.

A Time of Ferment. During Bhattacharya's childhood India lay under British colonial rule, a poor nation increasingly animated by nationalist sentiment. In the closing years of the nineteenth century figures destined for major roles in the saga of Indian independence were active across the world. Mohandas Karamchand Gandhi was in South Africa, where he battled racial discrimination against ethnic Indians there and campaigned for their rights. The Indian religious activist Swami Vivekananda, having turned from the aggressive skepticism of his youth to become the disciple of Hindu mystic Ramakrishna Paramahamsa, introduced the West to Hinduism at the first World Congress of Religions in Chicago (1893), then toured the United States, expressing an aggressive nationalism that inspired many leaders in India to fight against the British rule. Bankim Chandra Chatterjee's novel *Ananda Mutt* was published in 1904, provoking several leaders and sparking the revolutionary scheme known as *Bhavani Mandir.* The poet, political activist, educator, and later mystic Aurobindo Ghosh returned to India after withdrawing from civil service examinations in England. He founded a national school to educate students participating in the nationalist movement.

In 1898 young Bhattacharya's parents moved to the village of Kodalia. Bhattacharya studied in Harinabhi Anglo-Sanskrit School from 1899 to 1905 and caught the nationalist fervor. When the British government took the wholly unpopular decision to divide the province of Bengal, Bhattacharya expressed opposition and was expelled from school for doing so. He came into contact with local revolutionary groups. A turning point in the life of Bhattacharya came in 1905 with the death of his father. The following year, Bhattacharya entered the Bengal National College (the school Aurobindo Ghosh had founded) and studied at the Bengal Technical Institute for two years. By 1907 he was active with revolutionary terrorist groups opposed to British rule. That December he participated in the robbery of a railway station at Chingripota village in Bengal. In 1908 Bhattacharya was arrested in connection with the robbery, but the authorities could not establish sufficient evidence and he was released. His mother also died in that year.

Bhattacharya became very active in local revolutionary movements inspired by Aurobindo and discontinued his formal education, which he would never resume. In 1909 he participated in a *dacoity* (armed robbery) at Netra. He was arrested in January 1910, but again released due to lack of evidence. Between 1911

and 1914 he battled against British rule under the leadership of the prominent Bengali revolutionary Jatin Mukherjee. As part of a scheme to contact the Germans for help against the British, Bhattacharya sailed to Batavia (now Jakarta, Indonesia) under a pseudonym in April 1915. He returned to India that June, only to go again to Batavia for the purpose of acquiring arms, ammunition, and money from the Germans. In September 1915 Jatin Mukherjee was shot dead by British police. Dismayed at news of this, Bhattacharya resolved not to return to India until he could strike a telling blow against British rule. For nine months he wandered about Asia, seeking help from leaders including Chinese nationalist leader Sun Yat-Sen. Then German agents advised him to come to Germany for help.

Thus began the adventurous journey of the Indian revolutionary abroad. Bhattacharya posed as a Catholic priest from Pondicherry, the French colony in India. He grew a beard and carried a Bible. He also acquired a false passport and traveled from Japan to the United States by ship. By the time he landed in San Francisco in June 1916, the local press had published news about him; he did not linger in San Francisco but rushed to Stanford University, where Bengali writer Dhan Gopal Mukherjee was a student. He presented introductory letters to Dhan Gopal, who suggested that Bhattacharya adopt a new name. The identity of Manavendra Nath Roy was created in the United States in 1916.

Roy was still in the United States when Gandhi returned to India from South Africa, and so could not participate in what many considered the Indian nationalist movement's most glorious period. Instead, during this time he began to build an international reputation as a communist (see SOCIALISM AND UNBELIEF) and a rationalist (see RATIONALISM). Roy met Evelyn Trent, a Stanford University graduate who fell in love with him. Despite bitter opposition from her family, the two married in New York in 1917. Roy tasted the cosmopolitan life and Bohemian culture in New York. He met writer and politician Lajpat Rai, the "lion of Punjab," living in exile in New York. Engaged by Roy's sincerity and devotion to the cause of Indian freedom, Rai assisted him with paying work.

The British police continued tracking Roy in the United States in conjunction with their search for German agents of Indian nationality. Arrested in 1917, he was released after a warning. The Roys traveled to Mexico to escape the British police. While in Mexico, Roy began his embrace of socialism. To that point Roy's major commitment had been to nationalism.

Surprisingly, the financial help the Germans had promised reached him in Mexico. That enabled Roy to lead a comfortable life as he worked for the dual causes of India and his emerging socialist ideas. Roy was also in a position to offer hospitality and financial assistance to Mikhail Markovich Borodin, a Russian communist who was in desperate straits, having lost all his money. Borodin acquainted Roy with the theory and practice of communism.

Roy played an important role in Mexican politics and moved in higher circles of power. He became friends with the first president of the new Mexican Republic, Venustiano Carranza. Quick in learning languages, Roy mastered Spanish and contributed articles to *El Pueblo*, a Mexico City daily, and *El Heraldo de Mexico*, for which he wrote in Spanish and English. He also published several theoretical articles in Spanish. But he never forgot his own country, writing articles and books on the cause of Indian freedom.

Roy organized the Socialist Party of Mexico and became its general secretary, organizing the party's National Congress in the fall of 1919. Influenced by Borodin, the party later was converted into the Communist Party of Mexico, the first such party outside Russia. This brought Roy to the attention of Vladimir Ilyich Lenin. At this time the Russian Communist Party was establishing contacts with revolutionaries throughout the world. Lenin invited Roy to attend the Second Congress of the Communist International in Moscow.

Roy and Evelyn traveled to Moscow by way of Cuba, Spain, and Germany, forging contacts with several revolutionaries along the way. He befriended August Thalheimer in Germany and met with some Indian revolutionaries already working there; he befriended Hendricus Sneevliet in Holland. In May 1920 Roy reached Moscow. Roy's first meeting with Lenin was a surprise for both. Lenin was under the impression that Roy was elderly; instead he found a bubbling youth with intellectual flash. Roy was surprised at Lenin's short stature and his friendliness in conversation. Roy quickly forged friendships with top communist leaders including Leon Trotsky, Joseph Stalin, and Nikolay Bukharin, and met the famous writer Maxim Gorky.

At the Second Congress of the Communist International, Roy submitted an alternative thesis on national and colonial affairs. Lenin saw its point and allowed the proposal to come before the congress; it was discussed and accepted. Buoyed by this victory, Roy at once started work to establish the Communist Party in India. He was elected chairman of the Central Asiatic Bureau of the Comintern. Accompanied by Evelyn, he traveled to by train to Tashkent in present-day Uzbekistan, bearing a full load of arms and ammunition. Roy and Evelyn established an Indian military school in Tashkent and trained some *Mujahirs*—Islamic warriors against the British—who had journeyed from India.

On October 17, 1920, Roy, Evelyn, and others created the first Communist Party of India in exile at Tashkent. At great risk they sent money, literature, and advice to Indian communists. In India, British colonial rulers scented Roy's involvement and resumed their hunt for him. Meanwhile Roy established direct contact with top leaders of the Indian National Congress Party, addressing letters to Chitta Ranjan Das, the Congress

president. In 1921, Roy and Stalin established the Communist University of the Toilers of the East. Future presidents and prime ministers of colonial countries, including future Vietnamese leader Ho Chi Minh, received training in this institute; Roy and Evelyn served on its faculty. Between 1921 and 1929 Roy enjoyed a meteoric rise in the international communist movement, brushing aside opposition from Indian revolutionaries such as Virendranath Chattopadhaya and Avani Mukherjee then living in Russia and Germany.

Roy proved his ability through writings like *India in Transition*, a penetrating analysis. He launched a fortnightly magazine from Berlin, *The Vanguard of Indian Independence*. Evelyn assisted with the editing and wrote numerous articles under the name of Shanti Devi. When British rulers in India proscribed the journal, Roy launched another, *The Advance Guard*. Expelled from Berlin and France for his communist activities, Roy strove to continue to aid the Indian communist movement as he moved constantly around Europe. Even so, he played key roles in the international communist movement, holding many posts including top positions in the Comintern's Executive Committee, Politburo, Presidium, and Colonial Commission.

Roy edited yet another magazine, *The Masses of India*, which was dispatched into India clandestinely. In 1925 Roy and his wife, Evelyn, separated; she moved permanently to the United States, where she would die in 1970.

Conspiracy charges were lodged against Roy in India by the British police. But by 1927 Roy was in China aiding the Communist Party there. He met Mao Tse-tung, Chou Enlai, and other top leaders. Also present, representing Moscow, was Borodin, whom Roy had aided in Mexico. In China they clashed over policy matters. When China's Kuomintang government attacked the communists, Roy escaped across the Gobi Desert to Russia. The only Indian leader whom Roy met during his stay in Moscow was Jawaharlal Nehru, who appreciated Roy's intellectual brilliance. Leadership quarrels in Russia kept Roy out of the communist mainstream. Falling sick, Roy went to Germany for treatment. There he wrote articles in Thalheimer's journal, so angering the Stalin group that Roy was expelled from the party.

Eventually Roy decided to return to India. Traveling incognito, he arrived in 1930, joining Nehru's camp and working secretly under the name of Mahmood. Still, the British police discerned his presence after the Congress Party passed a resolution concerning fundamental rights that bore Roy's stamp.

In 1930, Indian communists following the Stalinist line exposed Roy to the British. He was arrested, tried, and sentenced to twelve years' imprisonment, which was reduced to six on appeal. No lesser figure than Albert Einstein appealed to the British to treat Roy humanely while in prison. Roy made productive use of his jail days, writing copious amounts of political, philosophical, and social criticism including his monumental work *The Philosophical Consequences of Modern Science*, portions of which would be published as *Heresies of the Twentieth Century*, *Materialism*, and *Science and Philosophy*. He corresponded extensively with political leaders and intellectuals worldwide, and with his girlfriend Ellen Gottschalk, then living in Germany. His letters to Ellen were hailed within India as literary masterpieces.

In November 1936 Roy was released from prison. His ideas had changed significantly, as they would continue to do; in particular, his reflections on MARXISM and communism had led him to emphasize critical thinking. Roy and Ellen married in 1937. In that year he joined the Indian National Congress, and briefly played an important role. Roy made enemies, among them Gandhi; dissatisfied with Gandhi's mystical obscurantism, Roy had backed the more nationalistic Subhas Chandra Bose against Gandhi in the 1938 presidential campaign. Ultimately he recoiled from national politics in that year, declaring nationalism an antiquated cult.

During World War II, Roy understood the dangers of fascism. He opposed the Indian communists, who had made a temporary pact with Adolf Hitler, going so far as to support the British. Roy predicted that if the British won the war they would soon leave India, a prediction that would come true. Yet at this time Roy was a voice in the wilderness, at odds with both communists and nationalists. In 1940 he started his own party, the Radical Democratic Party, India's first political party with an explicitly scientific orientation. His thinking continued its development; after eight years he recognized the defects of the party system and abandoned the Radical Democrats. Roy began touring throughout India, lecturing and recruiting intellectuals to join his Indian Renaissance movement, which was designed to spread the scientific spirit among the Indian public and recast Indian history from a scientific point of view. Roy launched journals including *Independent India*, *Marxian Way*, *Humanist Way*, and *Radical Humanist*.

India attained independence in 1947, validating Roy's earlier prediction. He grew yet more critical of Marxism and communism. By now Roy had turned all of his intellect and experience toward the evolution of humanist thought in India (see HUMANISM). He wrote extensively about scientific politics and the need to study history scientifically. In 1948 he published his definitive statement of humanist theory, *Principles of Radical Democracy*, comprising twenty-two theses.

When representatives of US and European humanist organizations founded the INTERNATIONAL HUMANIST AND ETHICAL UNION in Amsterdam in 1952, they elected Roy as vice chairman (in absentia). By then Roy had met with an accident in which he suffered brain damage. In his last days, Roy began dictating an autobiography, serialized in *Radical Humanist*; he would live only to cover the period to 1925. He also wrote a two-volume work

titled *Reason, Romanticism and Revolution* (1952, 1955), which would be praised by eminent humanists including Erich FROMM.

Roy died in Dehra Dun, India, on January 25, 1954. Several of his writings were published posthumously. Oxford University Press released a four-volume set of his works edited by the radical humanist Sib Narayan Ray, who also published a biography of Roy.

ROYALL, ANNE NEWPORT (1769–1854), American church/state activist and newspaper editor. Champion of the separation of church and state, Anne Newport Royall fought corruption and religious influence in American politics as a travel author and as editor of the newspapers *Paul Pry* and the *Huntress*. Her blunt honesty so annoyed her adversaries that she became the first American to be tried and convicted as a "common scold."

Frontier Beginnings. Anne was born in Baltimore, Maryland, in 1769, but was reared on the frontier of western Pennsylvania. At eighteen she moved to West Virginia and served as housekeeper for Revolutionary War veteran Maj. William Royall, who saw to her education in natural rights theory. They married when she was twenty-eight.

Following Major Royall's death in 1812, the Royall family contested Anne's inheritance of his estate. In 1819 a jury annulled William Royall's will, forcing Anne into an impoverished widowhood. Not undone, the resourceful Mrs. Royall began life as a travel writer. The resulting nine books documented sometimes embarrassing information about influential people she met in her travels from Louisiana to Maine.

Washington Lobbyist. After petitioning unsuccessfully to Congress for her husband's pension, she remained in Washington to put the principles she learned in Major Royall's humanist library to work. Though opposed to slavery and the use of alcohol, she disliked the religious positions of abolitionists and prohibitionists. She opposed religious influence in public schools and was known to destroy religious tracts by dumping them off steamboats and to chase evangelicals out of the congressional building with an old green umbrella.

In 1829 a conflict with a Presbyterian congregation resulted in a charge against her as a "common scold." On June 31 she became the first American found guilty of such a crime punishable by dunking. While the US Marines constructed a dunking stool, her attorney convinced the judge to change the punishment to a ten-dollar fine.

Following this humiliating event, she dedicated herself to the publication of two successive newspapers, *Paul Pry* and the *Huntress*. She spent the remainder of her eighty-five years exposing corruption and interviewing every president from James Monroe to Franklin Pierce with only the assistance of her friend Sally Stack and a handful of orphan boys. In 1854 the nearly penniless and unpopular editor died, a stalwart defender of eighteenth-century rationalism against the growing tide of nineteenth-century evangelism.

MELINDA GRUBE

RUSSELL, BERTRAND (1872–1970), Welsh-born English philosopher and mathematician. Bertrand Russell is remembered for theoretical work in philosophy and mathematics, for practical work as a reformer of such institutions as marriage and education, and for antiwar activism, but for many he is most noted for his mastery of English prose, for which he was awarded the Nobel Prize in Literature in 1950. Throughout his long life, Russell was an outspoken advocate of skepticism and a severe and effective critic of religion. In 1957 he prepared a preface for a new edition of his *Why I Am Not a Christian*, including a definitive statement of his AGNOSTICISM: "There has been a rumor in recent years to the effect that I have become less opposed to religious orthodoxy than I formerly was. This rumor is totally without foundation. I think all the great religions of the world—Buddhism, Hinduism, Christianity, Islam, and Communism—both untrue and harmful."

Russell's Scrutiny of Religion. Russell examined the alleged proofs of the truth of religion with the philosophical acumen for which he is famous. His most scholarly examination of proofs of God's existence was in relation to his study of the philosophy of Gottfried Wilhelm von LEIBNIZ, but perhaps his best known is his debate with Father F. C. Copleston. Sexual teachings of the Catholic Church were a special target because they did "definite harm." As a young man, Russell was attracted to the writings of William Kingdon CLIFFORD, a mathematician known for his statement of the ethics of belief, that belief must always be based on sufficient evidence; in 1946 he wrote that he saw in Clifford every ground for regarding the old virtues of tolerance and enlightenment as the basis for the hopes that are possible after two world wars.

Foundations of His View. The story of Russell's own life was by no means so simple. His parents intended that he be brought up without religion, in stark contrast to the community, but when they both died prematurely, the young Russell was turned over to his grandparents by court order. His grandfather, Lord John Russell, twice prime minister, died when Russell was still quite young, so the entire supervision of his introduction to religion and morality was left in the hands of his grandmother, Lady John Russell, and his aunt. As a child, Bertie had some exposure to enlightened thinking from contact with this older brother, Frank, and from some tutors hired to educate him at home, but his grandmother's austere and dogmatic religion prevailed, and Bertie found his brilliant mind was not allowed any outlet at home. Lady Russell was, as Russell tells it, the sort of Scotch Presbyterian liberal who demanded that everyone be well housed but at the same time opposed the construction of new houses on the grounds they were an eyesore. Lady Russell's religious opinions were sufficiently broad that she became a Unitarian when she was age seventy, but Russell's dominant impression was that she never understood "the claims of animal spirits and exuberant vitality." Russell loved his grandmother for the care and affection she showed him, but did not mind when she died. Many years later, he came to appreciate how much her character had shaped his own: fearlessness, public spirit, and contempt for convention. One of her favorite texts became a leading one in his later life, "Thou shalt not follow a multitude to do evil."

At Cambridge Russell could at last say what he thought without fear of derision, and he enjoyed university greatly even before he met G. E. MOORE, a freshman in Russell's third year. Russell's particular joy at Cambridge was a small discussion society known to outsiders as The Apostles. While still a freshman, Moore read a paper to the society that began: "In the beginning was matter, and matter begat the devil, and the devil begat God." Russell tells us the paper ended with the death of God, then the death of the devil, and finally with only matter left. Russell often described himself as a disciple of LUCRETIUS in the manner of Moore, and Moore as one who fulfilled his idea of genius, but admits he derived no benefit from the official lectures at Cambridge.

His first marriage, to Alys Pearsall Smith in 1894, resulted in a number of complex conflicts over religion. Alys was a believing member of the Society of Friends. Russell supported her in the campaign for votes for women, and became a pledged teetotaler to please her. She had to modify her view that "sex was beastly" to please him. In letters from almost a year before their marriage, Russell made clear to Alys that he was utterly out of sympathy with Christianity and was at best some sort of metaphysical pantheist. Using arguments he would continue to deploy against believers for the rest of his life, he tried both to convince Alys and to reach a state of mutual toleration. Russell pointed out that when with her, her religion seemed right, but when he thought about it he realized her religious beliefs were not based on any evidence but only on her wishes, "which thee would not accept as sufficient ground for an opinion about anything else." In this context, Russell mentioned John Stuart MILL's *Autobiography* as one of the deep roots of his own unbelief.

His Growth as a Writer. At about the time of his first marriage, Russell decided not to pursue a professional career but to become a writer. Ever since he was a child, Russell had dismissed organized religion, but he took religious experience, mysticism, and humanitarian impulses that transcended the individual ego very seriously, and throughout his life he read deeply in Christian classics. More importantly, he attributed his own style to his knowledge of the *Book of Common Prayer* and the King James version of the Bible.

By the turn of the century, Russell and Alfred North Whitehead had both produced mathematical books for which they planned second volumes. They decided to write a joint work, which eventually took over a decade to complete in three volumes and was titled *Principia Mathematica.* In the winter of 1900–1901, the same winter that Russell began to plan his great work, he had one of his most profound experiences, an experience which he claims changed his life forever, turning him from an imperialist into a pro-Boer and a pacifist. Russell went on to say that the mystic insight "largely faded," and his habit of analysis reasserted itself. Russell began an essay inspired by this experience while on a visit to Italy, and "The Free Man's Worship" was published in December of 1903. Although Russell rewrote part of the essay and repudiated some of its stoicism, it remains one of his most frequently reprinted, discussed, and appreciated short works, and serves well to document the nature of his unbelief at that time.

While still married to Alys, Russell became romantically involved with another, married woman with deep and complex religious convictions, one a year younger than himself but who had considerable experience in extramarital relationships. His liaison with Lady Ottoline Morrell, begun in 1911, resulted in a huge correspondence, much of it on religion. Nicholas Griffin has advanced the theory that were it not for the complexity and sincerity of her religious convictions, Lady Ottoline would not have been so attractive to Russell.

Russell first met Ludwig WITTGENSTEIN in 1911, at about the same time his relationship with Ottoline reached a crisis over her inability to understand Russell's unbelief and his inability to impress upon her the importance of basing all one's beliefs on evidence. Nicholas Griffin argues a desire to collaborate more with Ottoline was a major reason for his decision at this time to concentrate more on popular writing and less on technical work. During World War I, Russell worked vigorously in the antiwar movement. After the war, he resumed his work with Wittgenstein. Russell's main association with

Wittgenstein had to do, of course, with logic, but Russell took great interest in the mysticism of Wittgenstein's *Tractatus* and in the religious works Wittgenstein was reading during the war.

In the summer of 1920, while preparing for a long trip to China with Dora Black, who was later to become his second wife, Russell decided that he must obtain a divorce from Alys. To meet the legal requirements of the day, he staged an "official adultery" for the benefit of the lawyers in a London hotel.

Second Marriage. Russell's relationship with Dora Black shows his complete break with conventional social mores. From the late 1920s and into the 1930s his sincere opposition to religion and his need to raise funds for the Beacon Hill School corresponded. His lecture "Why I Am Not a Christian" (1927) was recognized as a classic, and was soon followed by *Sceptical Essays* (1928) and *Marriage and Morals* (1929). This last work caused great controversy, and the Episcopal bishop of New York was especially distressed. He had to wait more than a decade to get revenge. In 1940 he and other religionists were successful in preventing Russell from being appointed to teach at the City College of New York (CCNY).

After losing the CCNY job, Russell worked for the Barnes Foundation in Philadelphia. This, too, eventually ended in a dispute. Nevertheless, out of it came one of his best-selling books, *A History of Western Philosophy* (1945).

Later Life and Influence. In 1948, after World War II, Russell engaged Father Copleston in a radio debate on the existence of God as a BBC Third Program. The transcript has been reprinted many times and continues to be discussed in introductory classes in philosophy. Copleston was then unknown, but is now well known for his celebrated history of philosophy. Also in 1948 Russell wrote, "I hobnob with the Archbishop of York." Here the attraction was shared views on control of atomic energy. In 1954 Russell offered only mild objection when his daughter embraced Christianity. In 2004 the archbishop of Canterbury urged study of Russell's works as part of a program of religious education. The archbishop maintained that consideration of views like Russell's "protest atheism," that religion is morally bad, both in its practice and in its requirement that we worship a God who appears to be ultimately responsible for evil in the world, form a necessary part of teaching religion and that no good is served by ignoring one's critics.

Russell did not object to being called an atheist, an agnostic, a humanist, a skeptic, or a rationalist, but neither did he embrace any of these terms with enthusiasm. His writings are filled with nuanced discussions of the meaning of these terms. In particular, we may note his denial of ATHEISM on the grounds that there is some very small possibility that God does exist; his denial of skepticism such as that adopted by David HUME, which denies that any knowledge is possible; and his denial of HUMANISM on the grounds that on the whole the nonhuman part of the cosmos is much more interesting and satisfactory than the human part.

DAVID WHITE

RUSSELL, DORA (1894–1986), English sex radical and progressive activist. Born Dora Black, she became the second wife of Bertrand RUSSELL. A tireless proponent of peace, progressive education, and enlightened sexual policies, she was an effective organizer, a successful author, and one of the most important English feminists of the period between the world wars.

Early Experience. Well educated (Girton College, Cambridge), serious, and practical on political and social issues, Russell was primarily a sexual idealist. In 1917 during a dangerous crossing of the Atlantic, she was attracted to a naval officer, "a kind of daredevil who could have been a pirate." He was on a secret mission while still recovering from having his ship blown up by a submarine, but had never met the likes of Dora. One night, she wrote, minus the mandatory lifejackets, "in mid-Atlantic, on the top deck and a folded heap of sailcloth, under a bright moon and scudding clouds, he took my virginity."

With Bertrand Russell. Dora had a long and important career in progressive politics with and without help from Bertrand Russell. They both believed in sexual freedom, but understood it differently. Dora's writings on behalf of all women and all children are more detailed, more profound, and more inspiring than the philosopher's contributions. Dora first admired Bertie, as she always called him, for his public opposition to World War

I, and always credited him with teaching her to stand up and speak out for unpopular ideas. She would have been happy to continue as his partner in love, in the progressive school they ran together, and in movement for greater human freedom. Bertrand insisted they marry to provide an heir to his title. Neither demanded a monogamous relationship. Dora's analysis of their relationship, their life together, and especially of Bertrand's character is one of the most penetrating to appear in print: she understood she had to be both wife and mother to him.

Main Message. Dora was unimpressed with "external devices for the preservation of virtue." She considered marriage laws, police, and the military indications of human incompetence. She described European life as "treading the path of corset civilization," with laws and customs guided by an a priori religious ethic rather than considerations of needs and creative desires. The publication of her most important work, *Religion of the Machine Age* (1983), was long delayed. Ever since her visit to Russia in 1920, Russell understood that democracy could be defeated by the totalitarian tendencies of capitalism and of communism as industrialization became the organizing principle of society. She died at her home in Cornwall, where she had lived much of her life.

RUSSIA, THE SOVIET UNION, AND UNBELIEF: See **PROPAGANDA, ANTIRELIGIOUS (SOVIET).**

SADE, DONATIEN ALPHONSE FRANÇOIS, MARQUIS DE (1740–1814), French writer, philosopher, and libertine. Virtually unknown during his own lifetime, the Marquis de Sade's writings have since become almost sacred texts for generations of individuals fascinated by his extremism, his outrageousness, and his provocativeness. For with his unflinching honesty and his dogged effort to describe nature as it really is, Sade is the ultimate un-Romantic, the Dark Knight of the Enlightenment (see ENLIGHTENMENT, UNBELIEF DURING THE). His advocacy of strength as the ultimate moral virtue precedes that of Friedrich NIETZSCHE, and his atheistic avowal that life has no ultimate meaning anticipates the EXISTENTIALISM and postmodernism of the twentieth and twenty-first centuries.

Born in Paris to an aristocratic family, Sade was raised by his uncle, the Abbe de Sade, whose notorious sexual habits had a profound impact on his nephew, among other things inculcating his lifelong ANTICLERICALISM. Sade was to spend most of his life in prison for sexual deviancy, and it was there that he wrote most of the works for which he is now known. These erotic books—which include *Justine*, *Juliette*, *Philosophy in the Boudoir*, and *The 120 Days of Sodom*—are overly long, repetitious, and ultimately soporific. The saving grace of Sade's writings is not the sexual passages, which are more likely to nauseate than titillate, but rather the witty and incisive philosophical passages (often put into the mouths of the most monstrous of characters), which all too briefly pop up when one least expects them. It is these nuggets that have been of more influence than the endless descriptions of human degradation that consume so many of his pages.

Sade's first published work was the 1782 "Dialogue between a Priest and a Dying Man," in which the dying man convinces the priest through ruthless argumentation that there is no god or afterlife, and that hedonism is the only logical ethical system. The priest joins him in an orgy with three prostitutes as the man expires. This hilarious work was later issued as a pamphlet by the FREETHOUGHT publisher Emanuel HALDEMAN-JULIUS. It demonstrates Sade's affinity with the materialist philosophers of his day (see MATERIALISM, PHILOSOPHICAL), as well as his delight in shocking the sensibilities of his contemporaries.

Sade despised religious figures, and indeed all authority figures—not surprisingly, as he was imprisoned by the royal court of Louis XVI, the revolutionary government of Robespierre, and the regime of Emperor Napoleon I. He extolled the virtue of BLASPHEMY and argued that if God did exist He was the worst mass murderer and tyrant of all time.

In his last will and testament, Sade demanded that his body be buried in an unmarked grave with acorns planted within, so that a tree would grow upon the spot, completely obliterating his memory. In 1990 the respected French series *Bibliotheque de la Pleiade* issued a scholarly edition of Sade's complete work, encased in leather binding (being bound in leather, by the way, adding a nice if unanticipated Sadeian touch). The Marquis' scabrous writings now share space with the works of Balzac, Hugo, and other French "Immortals." After centuries of opprobrium, Sade seems to have finally become respectable.

TIMOTHY J. MADIGAN

SAGAN, CARL (1934–1996), American astronomer and popularizer. Carl Sagan was the world's leading planetary astronomer during the golden age of planetary exploration, a gifted teacher, the author of best-selling science books for the public, cocreator and host of the thirteen-part *Cosmos* television series, and outspoken spokesman for the excitement of scientific discovery and the highest values of science. He was also a prominent humanist and skeptic, always advocating open-minded skepticism toward questionable claims.

Sagan was the David Duncan Professor of Astronomy and Space Sciences and director of the Laboratory for Planetary Sciences at Cornell University throughout most of his career, where he played leading roles in the Mariner, Viking, Voyager, and Galileo unmanned spacecraft expeditions to the planets. Born in New York City, Sagan was educated at the University of Chicago, receiving his AB, BS, MS, and PhD degrees there from 1954 to 1960. He then taught at Harvard before moving to Cornell in 1968. In his scientific work he published widely on planetary science, especially planetary atmospheres. He had special interests in what led other planets' atmospheres to differ so vastly from that of the Earth and whether some might contain the building blocks of life. In addition to his deep interests in astronomy, he early on developed an interest in biology and the origins of life. During summers at Chicago he apprenticed to the Nobel laureate geneticist H. J. Muller. This combination of interests led to his first notable book, *Intelligent Life in the Universe* (1966), a unique collaboration with the Russian astronomer I. S. Shklovskii. Sagan arranged a translation of the Russian's book on the subject and with Shklovskii's encouragement extensively added to it, carefully marking with triangular symbols where his emendations began and ended. The result was a highly readable excursion through the science and best-informed scientific speculation about the possibilities of life elsewhere.

The book showed that the young Sagan had not only immense curiosity and broad and deep scientific knowledge, but also a wonderful talent for expressing serious scientific ideas in highly readable form. Over the coming decades this talent rocketed him to the forefront of the world's science popularizers and made him virtually a household name.

His 1973 book *The Cosmic Connection* brought him to the attention of a wide public. He revealed a fresh, lyrical, at times even poetic, style of expression and popularized the notion that we are star-stuff, composed of elements created inside of stars and spewed out over space in supernova explosions. His interests in the evolution of human intelligence led to his next book, *The Dragons of Eden* (1977). It won a Pulitzer Prize. Now Sagan was a superstar of science. That year he made the cover of *Newsweek*, and in 1980, the cover of *Time*.

His next two books, a collection of essays titled *Broca's Brain: Reflections on the Romance of Science* and *Murmurs of Earth*, were preludes to his most ambitious project yet, the thirteen-part public broadcasting television series *Cosmos* (1980). Here all of his eclectic interests, talents, and aesthetics came brilliantly together in a series of one-hour programs that, beyond their informative content, had a powerful inspirational quality. *Cosmos* was a huge hit. It was seen by half a billion people in sixty countries. It won Emmy and Peabody awards. Sagan's simultaneously published, handsomely illustrated book of the same title became the best-selling science book ever published in the English language.

Unlike many scientists, Sagan had no qualms about speaking and writing directly for the general public. He considered it an obligation and a privilege. He appeared nearly thirty times on NBC's *Tonight Show* with Johnny Carson and later became a regular contributor to *Parade*, the national newspaper magazine supplement. He always spoke entertainingly but eloquently about science, and of how the processes of science are uniquely able to determine truths about nature.

While Sagan saw science as an ennobling aspect of the human spirit to know and explore, he also recognized the tempting appeal of pseudoscience and the dangers of public misunderstanding or ignorance of science. Often against opposition, he encouraged his fellow scientists to openly examine rather than ignore controversial and unscientific claims on the fringes of science. In 1969 he and astronomer Thornton Page organized a symposium at the annual meeting of the American Association for the Advancement of Science (AAAS) applying the scientific method to UFOs, and they later edited a book based on it, *UFO's: A Scientific Debate* (1972). In 1974 Sagan and Immanuel Velikovsky squared off in another AAAS symposium, this one examining Velikovsky's bizarre planetary-pinballs ideas. This famous encounter is still debated today.

When the Committee for the Scientific Investigation of Claims of the Paranormal (CSICOP) was created in 1976, Sagan was a Founding Fellow. He remained an active supporter throughout his life, twice delivering keynote addresses at CSICOP conferences and receiving CSICOP's two highest awards. He also was a member of the Council for Secular Humanism's International Academy of Humanism. His writings and public appearances frequently addressed these issues. *Broca's Brain* contained a large section called "The Paradoxers," including a revised version of his Velikovsky paper and a lead chapter "Night Walkers and Mystery Mongers: Sense and Nonsense on the Edges of Science."

Major Sagan books exemplifying the power and beauty

of science continued coming. He wrote two with his wife, Ann Druyan (cocreator of the *Cosmos* series), *Comet* (1985) and *Shadows of Forgotten Ancestors* (1992), followed by *Pale Blue Dot: A Vision of the Human Future in Space* (1995). In between was his big science fiction novel, *Contact* (1985), eventually made into a thoughtful 1997 motion picture starring Jodie Foster.

In 1996 Sagan organized his thoughts and writings over the previous ten years about pseudoscience, superstition, and irrationality into a single book, *The Demon-Haunted World: Science as a Candle in the Dark*. He critically examined "alien abductions," "channelers," faith-healing fraud, the "face" on Mars, "past lives," hypnosis-based pseudotherapies, and crashed-saucer claims. He worried whether we might be on the brink of a new Dark Age, "the siren song of unreason more sonorous and attractive." He argued that scientific thinking and skepticism are our best way to safeguard democratic institutions. The book combined his uncanny knack for scientifically skewering questionable claims with compassion for those who sincerely believe in them. He reenunciated how creative thinking and skeptical thinking work together to provide powerful insights: "At the heart of science is an essential balance between two seemingly contradictory attitudes—an openness to new ideas, no matter how bizarre or counterintuitive, and the most ruthless skeptical scrutiny of all ideas, old and new. This is how deep truths are winnowed from deep nonsense."

Since late 1994 Sagan had been battling a rare disease, myelodysplasia, requiring a move with his family to Seattle for his treatments. He died on December 20, 1996, at the age of sixty-two. He had completed his final book, *Billions and Billions*, only two months earlier. It was a tragically premature death for a brilliant proponent of science and reason, a foe of all forms of superstition and irrationality, and an inspiring chronicler of humanity's fledging steps toward exploring and understanding the universe.

KENDRICK FRAZIER

SANGER, MARGARET HIGGINS (1879–1966), American birth control activist and feminist. Margaret Higgins was born in Corning, New York, one of eleven children. In *An Autobigraphy* (1938), Sanger recorded her childhood introduction to FREETHOUGHT and the power of the Roman Catholic Church to turn back social progress. Her freethinking father invited famous agnostic Robert Green INGERSOLL to speak in Corning, renting the town's only hall, which was owned by the local priest. Just before the address, the priest learned the speaker's identity and locked the doors. Sanger's father led the speaker and the audience through a mob and into the woods, where Margaret and others sat spellbound as Ingersoll orated. Her father's stalwart advice to his family was to be chained to no dogma, to depend not on a church but on oneself, and to "leave the world better because you, my child, have dwelt in it."

Spending three comparatively carefree years in Claverack, a coeducational school in the Catskills, Sanger returned home to nurse her dying mother in 1896. Weakened by multiple pregnancies, Anne Purcell Higgins died at age forty-eight of tuberculosis. Sanger, infected herself by the disease, attended nursing school in White Plains, New York, specializing in obstetrics. She married architect William Sanger in 1902 and had three children, Stuart (1903), Grant (1908), and Peggy (1910). Sanger nearly died of tuberculosis after Stuart's birth.

Sanger's Activism Begins. Sanger moved with her family to the heady atmosphere of New York City in 1912, rubbing shoulders with Emma GOLDMAN, Bill Haywood, and other radicals at Mabel Dodge's radical salons. That year Sanger, working as a nurse, helped supervise the relocation of children during the "Bread and Roses" textile workers' strike in Lawrence, Massachusetts. Sanger made national headlines when she testified before an investigating Congress. Sanger began a weekly column, "What Every Mother Should Know," for the *Call*, published by the Socialist Party. She turned her columns into a pamphlet, along with a second series, "What Every Girl Should Know," which was censored because Sanger used the words *syphillis* and *gonorrhea*.

Sanger's turning point was witnessing the death of patient Sadie Sachs from her second illegal abortion. When the twenty-eight-year-old mother had pleaded with her doctor for birth control, he had responded, in Sanger's presence: "Tell Jake [Sadie's husband] to sleep on the roof." Sanger took off her nurse's uniform and resolved to learn the secrets of fertility control and to share them with women. Sanger researched contraception, coining the term *birth control* (see BIRTH CONTROL AND UNBELIEF) while editing a monthly newspaper, the *Woman Rebel*. Its motto was "No Gods, No Masters," and its purpose was to challenge the 1873 Comstock Act, which classified contraceptives as "indecent articles" and prevented dissemination of contraceptive information through the mails (see COMSTOCK, ANTHONY, AND UNBELIEF; SEXUAL VALUES, IMPACT OF UNBELIEF ON). Facing forty-five years in prison when indicted under the Comstock Act, Sanger fled the country in 1914, leaving behind a book, *Family Limitation*. It sold ten million copies while Sanger continued her research in England and the Netherlands.

Sanger returned to the United States after her estranged husband was personally arrested by Comstock and jailed for a month. Her daughter, Peggy, died of pneumonia in November 1915. Devastated, Sanger went on a headline-making speaking tour to challenge the charges against her. Sanger announced that, like earlier English birth control advocate Annie BESANT, she would defend herself. Famous names petitioned the president on her behalf as news coverage built, and the charges were dropped in 1916.

A Practical Activist. Sanger opened the first birth control clinic that year, in Brooklyn, New York; it was raided ten days later. Although Sanger's conviction and thirty-day sentence were upheld by the New York State Supreme Court in 1917, the court ruled that contraceptive advice could be given to cure and prevent disease. By 1923 Sanger had recruited Dr. Hannah Stone to staff the Birth Control Clinical Research Bureau, which scrupulously documented birth control efficacy and trained physicians.

Sanger financed a gynecologist to lecture physicians on birth control techniques, signing up twenty thousand physicians to take referrals. She personally recruited two doctors to design a contraceptive jelly to use with diaphragms. She provided her Brooklyn clinic with up to one thousand diaphragms a week, bootlegged through Canada by her second husband, oil tycoon Noah Slee, whom she had married in 1922. Slee loaned money to birth control supporters to open America's first diaphragm factory. Continually beseeched by women seeking help, Sanger was believed to have received the highest volume of mail of nearly any contemporary private citizen. She excerpted these poignant letters in *Motherhood in Bondage* (1928).

Sanger wrote *My Fight for Birth Control* in 1931, when fifty birth control clinics were open in United States. When Japanese diaphragms she had ordered were destroyed by US Customs under the Comstock law, Sanger sued. In 1934 a federal judge ruled in *United States v. One Package* that the Comstockian Revenue Act did not apply to contraceptives. The Circuit Court of Appeals agreed in 1937, ending the sixty-three-year reign of Comstockian censorship over the mails.

By the late 1930s, the United States had more than three hundred birth control centers, but World War II put the movement on hold. Marginalized for a while in her movement, Sanger, seventy-three, planned a world conference in 1952, cosponsored by Albert Einstein, Eleanor Roosevelt, and others. It resulted in the International Planned Parenthood Federation and Sanger became its first president. With financial help from a woman benefactor, Sanger next commissioned a study on steroid hormones and other laboratory studies, which resulted in "the pill," released in 1960. Sanger lived to witness the US Supreme Court decision *Griswold v. Connecticut* (1965), declaring a constitutional "right to privacy" in striking down a Comstockian law denying married couples contraception.

A Secular Visionary. *Woman and the New Race*, published in 1920, promoted erotic fulfillment for women and named Christianity as the principal enemy of women's progress. It sold a quarter of a million copies. Sanger accused Christianity of having turned the clock back two thousand years for women. Wherever she spoke, in the United States and around the globe, Sanger was dogged by Roman Catholic censors. The most celebrated episode involved Catholic Archbishop Patrick J. Hayes, who canceled her talk on "Birth Control—Is It Moral?" at Town Hall in New York City and had her arrested. After World War II, Gen. Douglas MacArthur barred her from entering Japan at Roman Catholic behest.

Sanger wrote and published extensively, including two long-lived journals on birth control and fertility. Her books make freethought references, such as her autobiographical comment: "I wanted each woman to be a rebellious Vashti, not an Esther." Although she spoke and wrote with great effectiveness, her greatest contributions were deeds, not words. Though a streak of mysticism surfaced in the emotional Sanger during some crises, she was without religion. Not content with simply being "a rebellious Vashti" herself (she was jailed eight times), Sanger was determined to deliver birth control information and devices worldwide during her lifetime. Willing to confront the power of the churches and their dogma head-on, Sanger succeeded in her quest, becoming the twentieth century's most effective feminist activist.

ANNIE LAURIE GAYLOR

SANTAYANA, GEORGE (1863–1952), American philosopher. George Santayana was born Jorge Austin Nicolas de Santayana on December 16, 1863, in Madrid, Spain. His mother brought him to the United States in 1872 and deposited him in Boston. He attended Boston Latin School and Harvard University, reading voraciously in several languages and writing poetry and philosophy. Upon graduation from Harvard, he shared a fellowship to Germany, where he studied philosophy and worked on his dissertation.

Upon his return to the United States, Santayana started teaching at Harvard, where he was eventually promoted to professor. He taught with passion and was greatly admired by his students. Nevertheless, he retired as soon as he could afford it, sailing for Europe in 1912.

He spent the next forty years of his life traveling from city to city, writing almost until his last days. He died in Rome in 1952 at the age of eighty-nine.

Santayana's father was a freethinker (see FREETHOUGHT), meaning that he refused to accept beliefs merely because they were orthodox. His son followed in his footsteps and in the process developed a philosophical system uniquely his own. At the center of his convictions is the insistence that human theories and practices must not be at odds with each other. His call for honesty in philosophy makes it impossible for hungry skeptics to claim, for example, that they can't know if anything exists, so long as they can find their way to the refrigerator.

Santayana is, by native tendency, a materialist (see MATERIALISM, PHILOSOPHICAL), seeking the natural or biological foundations of our hopes and values, and refusing the cheap consolation offered by imagining a rational and just world operating under divine guidance. But he is in love with the symbolic life of religion and with the higher reaches of spirituality it sometimes fosters. His system of thought can be seen as an attempt to graft the insights of religion onto a naturalistic view of life. He writes as if his central question were: What role can religion play in a world without God, immortality, and a reassuringly stable human nature? His thought offers a constructive and systematic answer to this question, an answer attractive to religious and secular people alike.

He maintains that it would be in vain to deny the obvious: human beings are animals whose power and lives are limited by nature. The world is pretty much as we experience it, offering no evidence of divine regulation or of a glorious destiny for any of us. We are psyches—intelligent material organisms—engaged in a constant struggle for survival. Our home is the world of substance in which everything preys on everything else, for "matter is essentially food." A vision of the future, along with self-control, enable us—under favorable circumstances—to live a life of reason. This requires limiting our desires to those that do not get in each other's way and thereby allow us a modest maximization of our satisfactions.

A life of reason offers harmony of our natural impulses. It involves realistic assessments of our situation, intelligence, hard work, and a spirit of compromise. But its values are neither absolute nor unconditional; reason is a good only to those who embrace it. There are, in fact, no universal values. What we prize depends on who we are, and human natures are indefinitely various. The right moral stance, therefore, is toleration of others so long as their satisfactions do not interfere with ours, along with fierce allegiance to our chosen way of life. Santayana has no difficulty in reconciling universal sympathy for life in all its forms with personal preference for a limited set of values; the good is relative when we try to understand people and absolute when we enact our own.

Spirituality consists in consciousness—"intuition" in Santayana's language—of essences, which are features of existence and themes of thought. The specific essence intuited matters little; everything hangs on the stance with which mind approaches its object. The spiritual attitude is one that forswears use and practical interest, permitting absorbed contemplation or enjoyment of what is presented. This occurs in our experience whenever we take delight in the appearance of things without concern for their promise or fate. A world of beauty opens when, forgetting past and future, mind sheds its cares. The unhurried exploration of pure form completes life by making each of its moments satisfying and significant. This is "religion" in its purer, spiritual form. It provides no consolation for the fragility and passage of biological existence, but serves as the capstone of human life.

Santayana was raised a Catholic and never officially relinquished his religion. He made a careful study of the Bible, the results of which are well demonstrated in his *The Idea of Christ in the Gospels or God in Man.* He is thoroughly familiar with the classics of Christian and Jewish theology, and he often refers to Hindu, Buddhist, and Muslim religious notions and texts. He was as concerned with the truth of religious ideas as he was with the role of religion in a full and satisfying life.

His first attempt to understand the nature of religion, *Interpretations of Poetry and Religion* (1900), set the tone and established the main theses of his view. Religion, he argues, is poetry when it becomes a guide to life. Its truth is symbolic: it offers a description of the human condition in imaginative terms, with consequent prescriptions for how to lead it. What look like factual claims in sacred texts need to be reinterpreted as symbolic insights into human life and destiny. "The fear of the Lord is the beginning of wisdom," for example, is best understood if we drop reference to a mighty person who may arbitrarily punish us and substitute for it the source of fear with which we are all familiar, namely, nature in its uncontrolled manifestations.

The imagination is a vital human faculty, expressing the deepest concerns and keenest insights of the psyche. For this reason, calling religion a work of the imagination is no insult: it is an authentic and relevant response pressing circumstances wring from the animal soul. To take such poetry literally is to lose its meaning or to demean it by converting it into fairy tales. Such "dreaming in words" is not uncommon among childlike or superstitious people, but cooler heads have always thought that stories of the exploits of gods need interpretation.

There are two major tendencies in religion. The first leads to religions of piety toward the source, the second to what he calls "ultimate religion." The central object of piety is the power of nature; on it depend our precarious lives. The association of religious values with hearth and home, with land, with the seasons, and with the productivity and destructiveness of nature all point to faith focused on human flourishing. Beliefs in immortality and heaven are extensions of this concern for abundant life.

Ultimate religion faces in the other direction, seeking spirituality rather than well-being. It accepts whatever nature may provide, but does not lay up its treasures on earth. In Santayana's view of the spiritual life, it makes no demands and asserts no preferences. Its attitude is one of humility or even indifference toward worldly matters, as it celebrates the glory of the moment. This drunkenness with the immediate obliterates concern with animal life and opens the door to eternal rapture or contemplative absorption.

When it comes to God, Santayana is uncompromising: he denies the existence of a deity conceived as "the creator of the world and the dispenser of fortune." For him, the question of God's existence boils down to the issue of whether the power we call by that name deserves a designation suggesting providential care. Santayana thinks that, considering the way of the world, it does not; it is more accurate to call that power *matter*, a force that is indifferent to human welfare. Yet the notion of the triune Godhead is useful for identifying the similarities and differences between Santayana's ontology and ordinary religious consciousness.

At the culmination of his monumental *Realms of Being*, Santayana examines the conception of the Trinity, comparing it to his four-realm ontology. He finds that the Nicene Creed and subsequent theology have the makings of a sound account of reality but, unfortunately, lose their way when they dissolve necessary distinctions in the unity of the divine individual. Persons are ontological hybrids, combining matter, form, consciousness, and, because they have a history, even truth. The point of ontological analysis is to differentiate categories; it does not help the cause of understanding to conflate them by assigning all of them to a primordial, generative person. Santayana reverses the process by reducing Christian theology to its "secret interior source." He does so by showing how the Trinity can be interpreted in terms of the distinctions of his naturalistic four-realm ontology.

God the Father, the all-powerful maker of heaven and earth, is the religious name for the realm of matter. The Nicene Creed specifies that all things are created through the Son, and this suggests to Santayana the necessary role that essence plays as an element in all existence. Matter and essence are equi-primordial, and together constitute the Logos, the truth or formal structure of the world. The Holy Ghost that speaks by the prophets proceeds from both the Father and the Son; this is a good description of spirit, a product of matter and form united in living animals that enjoys primacy as the locus of all knowledge and communication.

Santayana's elegant style makes his works a pleasure to read. His grand project of reconciling a naturalistic worldview with the positive achievements of art, religion, and morality may not succeed in every particular, but it sets a high standard. His views resonate deeply with individuals who value religion but find theology not very plausible, and also with those admirers of science who hunger for a worldview that acknowledges more than the movement of matter in space. Santayana has now emerged from the usual obscurity that attends death and appears to be on his way to new levels of appreciation. Thoughtful people will always find his works tough minded but full of light.

JOHN LACHS

SARTRE, JEAN-PAUL (1905–1980), French philosopher and author. After his father died, when he was only four years old, Jean-Paul Sartre grew up in the home of his grandfather, Crétien-Charles Schweitzer, uncle of the more famous Albert Schweitzer. In his autobiography *Words* (*Les Mots*, 1963) Sartre gives an amusing account of the hothouse atmosphere of this household, in which he felt as though his mother was his elder sister, and in which he was treated in every way as a boy genius. The idyll came abruptly to an end with his mother's remarriage to an engineer from La Rochelle, and the move to this town introduced Sartre to an environment that was tougher and more realistic than his grandfather's library. In 1924 he gained entrance into the École Normale Supérieure. He failed in his first attempt to pass the *aggregation*, the French teaching qualification, in 1928, but in 1929 topped the year, followed by Simone de Beauvoir, who had become his lover. During the 1930s he taught philosophy in a lycée in Rouen and spent some time in Berlin studying the phenomenology of Edmund Husserl and Martin Heidegger, whose philosophy had been introduced to him in a book by Emmanuel Levinas. When war broke out he was called up, and for a short time made a prisoner of war, but he returned to Paris in 1941. It was during World War II that he first published the work which made him famous as a philosopher, *Being and Nothingness* (*L'Être et le néant*, 1943).

A number of fundamental ideas developed in *Being*

and Nothingness were first set out in works published by Sartre during the 1930s. Sartre's first and most famous novel, *Nausea* (*La Nausée*, 1938), gives expression to his belief in the contingency and meaninglessness of material things considered in themselves. On the last pages of the novel, the "hero" Roquetin's relief at hearing a jazz melody hints that the origin of all value lies in human creativity. The claim that values are grounded in human freedom would remain a central proposition of Sartre's philosophy, both early and late. In the *Imaaginary* (*L'Inaginaire*, 1940) Sartre developed a rejection of idealism, and anticipated his theory of our experience of the image as a nonexistent being, which was to play an important part in *Being and Nothingness*. His "Transcendence of the Ego" (*La Transcendance de l'Ego*), which appeared in *Recherches Philosophiques* in 1936–37, argued that the ego is outside consciousness and "is a being of the world, like the ego of another." In order to argue for this he made consciousness a transcendental field, contrasting it with the I, the empirical ego. These two ideas combine in *Being and Nothingness* to form a picture of consciousness as a pure relation to being in itself, which it is not, and so as ultimately the origin of nothingness. Many features of the philosophy of *Being and Nothingness* show evidence of the influence of Heidegger. In particular, Sartre's belief that phenomenology can illuminate ontology derives from Heidegger. Notoriously, he also shares Heidegger's tendency to speak of nothingness as having a kind of being that cannot be reduced to the subjective act of negation. But unlike Heidegger he thinks of the nothing not as something extramundane that is the ground of being, but as a relation "coiled in the heart of being—like a worm" that separates consciousness from the being that it is conscious of. This separation is the source of our radical freedom.

It is the implicit awareness of our radical freedom and responsibility for the values that we promote that Sartre says we experience as anguish, and which we attempt to flee when we fall into bad faith. Lying to oneself requires a paradoxical capacity to both know the truth and to hide it from oneself. Sartre rejects attempts to explain the phenomenon of self-deception as residing in the unconscious, for it seems to him that there must always be some element of the system, the censor, which both knows the truth to be hidden and hides it. Sartre concludes from this that in order for bad faith to be possible people must ambiguously be what they are not and not be what they are. This lack of self-coincidence is something that humans attempt to flee when they strive to be a Godlike in itself/for itself. This attempt is a useless and unachievable passion. Nevertheless, Sartre hints at the possibility of the achievement of good faith, or authenticity, when an embodied consciousness does not attempt to deny its lack of self-coincidence, nor the freedom and responsibility that results from it.

Since freedom is for Sartre a fundamental feature of consciousness, no social constraint could rob a conscious being of its freedom. This led him to his notorious claim that a slave in chains is as free as his master, a claim which he himself later gave up, and of which he said that he found it incredible that he could ever have expressed it. After the war Sartre became convinced that Marxism had captured a good deal of the truth of history, but he never accepted a deterministic dialectic. In works such as *Search for a Method* (*Question de Méthode*), the first version of which appeared in 1957, he outlined his view that without consciousness and intentionality history would be meaningless. He summed up his mature attitude to man's relation to history in the first volume of *Critique of Dialectical Reason* (*Critique de la raison dialectique*, 1960), where he says that man makes history to the extent that history makes man. This complex attempt to acknowledge how the congealed praxis of past generations, the concrete and ideological constraints that have been built up over time, limit the freedom of the human individual, without negating the responsibility for transcending the past, has been far less read than Sartre's early work. Consequently he is often characterized as the philosopher of a rather naive radical freedom.

Despite a philosophy that superficially looks like an ethical nihilism, and which grounds ethical values in human freedom, Sartre was in fact a philosopher who took ethical and political issues extremely seriously. His novels constitute an attempt to write an engaged literature, which makes relevant to a readership beyond the philosophical community important political and ethical issues. Although Sartre sometimes wrote as though all values could be questioned, there is a sense in which honesty remained for him an unquestioned value. Implicitly, he demonstrated a faith that an honest acceptance that ethical mores are our collective responsibility and that they rest on nothing more than our decision to endorse them would, if universally adopted, lead to the rejection of oppression, inequality, dogmatism, and the self-delusion that allows people to accept situations in which some individuals tyrannize over others.

KAREN GREEN

SCANDINAVIA, UNBELIEF IN; SCANDINAVIAN LITERATURE, UNBELIEF IN. See **DENMARK; FINLAND; NORWAY; SWEDEN.**

SCHILLER, FERDINAND CANNING SCOTT (1864–1937), pragmatist and commentator. An important philosopher in his day, now largely forgotten, Ferdinand Schiller championed a version of PRAGMATISM he called HUMANISM. Schiller was born in Denmark to a German family living in England that had made its money in India. He was educated at Rugby and Balliol College, Oxford. In 1897, after a short but significant stint at Cornell University in the United States, he returned to Corpus Christi College, Oxford, where he taught until 1926. While in the United States, Schiller had been exposed to the emerging philosophy of pragmatism, especially as articulated by William James. Schiller spent his career arguing for his version of pragmatism, which he called humanism. From 1926 onward Schiller spent part of each year lecturing at the University of Southern California. In 1935 he moved there permanently. He died on August 9, 1937.

While acknowledging James's importance, Schiller took pragmatism in a more subjectivist direction than his mentor. While remaining a theist, Schiller resolutely opposed any form of foundationalism, or claim of objectivity. All truths are human creations, he argued. In speaking of humanism, Schiller wanted to anthropomorphize pragmatism. He often returned to the saying attributed to the pre-Socratic philosopher PROTAGORAS that the human being is the measure of all things. Where NATURALISM spoke of humanity's accommodation with nature, humanism spoke of its control of nature. It is now apparent that Schiller's understanding of humanism suffers from an element of anthropocentric conceit, although, in his defense, he did criticize this aspect of human nature, which he called "yahoo-manity." Schiller's understanding of humanism did not survive him.

Schiller was a prolific and facile writer. His main works were *The Riddle of the Sphinx* (1891), *Humanism: Philosophical Essays* (1903), *Studies in Humanism* (1907), and *Our Human Truths* (1939). Unusually for philosophers, Schiller was famous for his sense of humor. In 1901 he wrote *Mind! A Unique Review of Ancient and Modern Philosophy, Edited by A. Troglodyte, with the Cooperation of The Absolute and Others*. This spoof of the prestigious philosophical journal *Mind* included articles titled "The Critique of Pure Rot," by I. Cant. Later in his life Schiller penned an essay called "Must Philosophy Be Dull?"

BILL COOKE

SCHLICK, MORITZ, AND THE VIENNA CIRCLE. Moritz Schlick (1882–1936) studied physics in Berlin under Max Planck. He was professor of philosophy at the University of Vienna from 1922 until he was shot dead by an insane student. Schlick was the initiator and leader of the Vienna Circle, a group of philosophers, scientists, and mathematicians who met regularly for intense discussions from 1923 until 1936.

Schlick was deeply influenced by Ludwig WITTGENSTEIN, who lived in Austria but never was a member of the Vienna Circle. Schlick was also deeply influenced by Rudolf Carnap, who was a leading member of the Vienna Circle. Other important members of the Vienna Circle were the sociologist and philosopher Otto Neurath, the philosophers Friedrich Waismann and Herbert Feigl, the mathematician Hans Hahn, the historian and philosopher Victor Kraft, the lawyer Felix Kaufmann, and the logician and mathematician Kurt Gödel. In addition the Vienna Circle received a number of visitors from abroad, including the Prague physicist Philipp Frank, the Finnish philosopher Eino Kaila, the Danish philosopher Jörgen Jörgensen, Carl G. Hempel from Berlin, Alfred Jules AYER from Oxford, and the Norwegian philosopher Arne Næss.

Many members of the Vienna Circle and its visitors subscribed to a philosophy called LOGICAL POSITIVISM or logical empiricism. The logical positivists were sharply critical of metaphysics. Their aim was a unity of science expressed in common language, to be achieved by logically analyzing and clarifying the statements of various sciences. In this clarification a verifiability principle of meaning was introduced (see VERIFICATIONISM), according to which only the analytic statements of logic and mathematics and verifiable statements of the empirical sciences were said to be meaningful. Other statements were metaphysical and meaningless. This implied that the concept of god and other metaphysical concepts were by definition meaningless. Explicitly or implicitly, the logical positivists were atheists (see ATHEISM) and rejected religion. In general, the logical positivists took small interest in ethics, but Schlick wrote *Fragen der Ethik* in 1930. It was published in English as *Problems of Ethics* in 1939.

FINNGEIR HIORTH

SCHROEDER, THEODORE (1864–1953), American libertarian activist. The child of progressive German immi-

grants, Albert Theodore Schroeder was born near Horicon, Wisconsin, on September 17, 1864. His father was an agnostic, his mother, a Protestant. Theodore left home at fifteen to travel, taking brief odd jobs and eventually visiting every state. He called this time period his "wanderlust years." He attended school during the winter months. He was an avid reader of authors such as Ludwig FEUERBACH, Robert Green INGERSOLL, John Stuart MILL, Herbert SPENCER, VOLTAIRE, and Thomas PAINE. In college at the University of Wisconsin, he was also active in the Sigma Chi fraternity, and earned degrees in civil engineering and law.

Schroeder opened a law office in Salt Lake City, Utah, in 1889. At first he sympathized with the Mormons for what he thought was unfair persecution based on their religious practices, but soon he saw trouble in the close relationship between church and state in Utah and became increasingly anti-Mormon. He wrote several pamphlets challenging the Mormon Church. By the time he left Utah in 1900, he had successfully prosecuted Mormon church leader and politician Brigham H. Roberts, ensuring his ouster from the US House of Representatives. Schroeder's wife of five years, Mary Parkinson, died in 1896; he also lost a young daughter.

In 1900 Schroeder moved to New York City. He still practiced law, but became more interested in research and writing. In New York he met many socialists and anarchists and worked to defend their civil liberties (see SOCIALISM AND UNBELIEF; ANARCHISM AND UNBELIEF). The Free Speech League was formed in 1911 by Leonard D. Abbot, Lincoln Steffens, Bolton Hall, Gilbert E. Roe, and E. B. FOOTE, with Schroeder serving as secretary, as well as writing publications and providing legal assistance. The league was a precursor to the American Civil Liberties Bureau, now the American Civil Liberties Union. Other radicals such as Emma GOLDMAN later became involved. Schroeder also aided in the defense of Moses HARMAN during his 1905 obscenity trial (see SEX RADICALISM AND UNBELIEF). He continued to write and publish articles and books on free speech cases and obscenity laws, such as *Free Speech for Radicals* (1912, 1916) and *Free Speech Bibliography* (1922). He was associate editor of the periodical *Arena* and also wrote for *THE TRUTH SEEKER* and the *American Journal of EUGENICS*.

Schroeder had long been interested in psychology, and by 1901 started to develop a theory that promoted a connection between emotional and intellectual maturity, applying a psychological approach to society's ills. His attacks against religion increased, and in the 1920s he assisted Bishop William Montgomery Brown in a HERESY case brought by the Protestant Episcopal Church. Brown's radical views had increasingly come into conflict with his church, and four years after he published an essay titled "Communism and Christianism," heresy charges were brought against him.

Nancy Sankey-Jones, a libertarian feminist, married Schroeder in 1908, and they moved to Connecticut, where he died in his sleep on February 10, 1953. After his death, two relatives were successful in preventing the publication of the remainder of his unpublished writings. The case went to court, where the judge ruled that Schroeder's writings "offend religion and extol antisocial ideas."

SCIENTISTS, UNBELIEF AMONG. Science and religion are not necessarily at loggerheads, and the results of scientific inquiry do not necessarily controvert religious belief; nevertheless, there are clear tensions between scientific and religious knowledge systems (see RELIGION IN CONFLICT WITH SCIENCE). Scientists employ "methodological NATURALISM," the normative concept that scientific investigations use only natural law and its consequences, and deal only with objects or claims that have testable consequences in the natural world. Methodological naturalism is different from "philosophical naturalism," the ontological conviction that nothing exists beyond natural law and effect. While scientists are necessarily methodological naturalists, they are not necessarily philosophical naturalists and therefore not necessarily unbelievers.

The theologian Ian Barbour has developed several models to describe the interaction between (naturalistic) science and (supernaturalistic) religion. Adopting one of these models, Stephen Jay GOULD prominently argued that science and religion are not incompatible, that they occupy what he termed "nonoverlapping magisteria," or separate teaching authorities; his claim received largely negative attention from scientists and theologians alike. For example, as John Lynch has noted, Gould defined religion precisely to ensure the success of his proposal. He thus presented a theology with jurisdiction solely over ethics and morals, and stripped religion of most of its traditional meaning and power: in Gould's religion, there is no discussion of origins, design, progress, purpose, guided process, or a personal deity. By so defining

religion, Gould could easily claim no overlap or conflict—science retains its power and prestige, while religion is redefined so as not to distress the scientific mind.

Two Conflicts between Science and Religion. While Gould may be right in principle, science has made claims about matters religious and religion about matters scientific since before the dawn of modern science. Two scientific theories in particular, heliocentrism and EVOLUTION, have caused significant conflict. The heliocentric theory of Nicolaus Copernicus presented a profound challenge to the church, which believed that the earth was the center of the universe. A generation or so after Copernicus, Giordano BRUNO speculated that the universe was infinite and the stars were suns like ours. Bruno subscribed to a theory of nonoverlapping magisteria and maintained that the Bible should be read for its moral but not scientific value; partly for this HERESY he was burned at the stake in 1600. For his support of Copernicus's ideas, Galileo GALILEI ran into trouble with the church and spent his last decade under house arrest. The trials of Galileo and Bruno set the stage, at least within the popular imagination, for the clash between modern science and certain doctrinaire religious beliefs. Nowhere did this clash become more apparent than in the rise of evolutionary thought (see DARWINISM AND UNBELIEF).

Evolution was in the air when Charles DARWIN and Alfred Russel WALLACE independently developed their theory of natural selection. Darwin's grandfather, Erasmus DARWIN, had proposed a vague teleological theory of evolution, and Jean-Baptiste de LAMARCK in the early 1800s devised a theory of inheritance of acquired characteristics. The explanatory power of geologist Charles Lyell's actualism—the principle that only forces operating today can be used to explain occurrences in the past—and his uniformitarianism—the principle that geological forces have operated at a constant rate and strength throughout time—proved great enough to finally unseat the biblical account. However, as evidence for an earth much older than the age calculated from biblical genealogies was accumulating, a number of "scriptural geologists" denounced the emerging discipline of professional geology, which they rightly saw as undermining literalist beliefs. Many Victorian geologists, however, remained believers and maintained strong evangelical credentials when faced with scientific findings.

Darwin himself may have postponed publishing *On the Origin of Species* (1859) for fear of the religious establishment. Later in life he became an agnostic (see AGNOSTICISM), partly because of the death of his ten-year-old daughter, Annie. Darwin's eventual lack of belief was thus ultimately for moral (rather than scientific) reasons, and indeed the theory of evolution does not necessarily militate against belief. Asa Gray, a scientist contemporary with Darwin, for example, accepted evolution while remaining a devout Christian. But Darwin's ferocious popularizer, the skeptic Thomas H. HUXLEY, perceived Darwin's naturalistic theory as a way to separate science from the old order. His famous debate with Bishop Samuel Wilberforce, in which he is said to have trounced Wilberforce, helped foster the perception that science and religion are antagonists. This view was promulgated in the United States by the writings of both John W. DRAPER and Andrew Dickson WHITE, and later by Richard Dawkins and Daniel Dennett.

War between Science and Religion in the United States. The tensions between science and religion are stronger in the United States than in Europe and are strongest among Protestants. These tensions may have begun in their modern form during the furor that followed after Ezra Cornell and White in 1865 founded Cornell University as a nonsectarian university that put the sciences on an equal footing with other studies. Draper thought the fight was between science and religion in general, whereas White came to believe that it was between science and dogmatic religion.

The Scopes trial, wherein John T. Scopes was convicted of teaching evolution in 1925, was a skirmish in the war, but its repercussions are felt to this day as biblical literalists oppose teaching evolution and support a "scientific creationism" that denies the great age of the earth and the common ancestry of living things. Modern opponents of evolution see themselves as oppressed by a scientific, naturalistic hegemony. A few of these opponents hold scientific credentials but refuse to allow their science to influence their (often literalist) religious beliefs. When scientific creationism was literally thrown out of court in the Supreme Court's 1987 decision *Edwards v. Aguillard*, it was replaced by intelligent design creationism (see INTELLIGENT DESIGN THEORY). This variation of the argument from design claims that living organisms are too complex to have evolved by natural mechanisms; therefore, an intelligence must have guided evolution. Though it tries to appear scientific, intelligent design creationism undermines science, for example, by ruling naturalistic explanations out of bounds for certain phenomena such as the origin of complex molecular systems. Indeed, Phillip Johnson, a retired Berkeley law professor and a leader of the movement, erases the critical distinction between methodological and philosophical naturalism and admits that his intention is to defeat naturalism. Intelligent design creationism, like scientific creationism, is a frontal attack on science in the service of a religious agenda. It thus profits from the public image of scientists as disbelievers, and helps to maintain that image. But is that image borne out by the data?

Measuring Unbelief among Scientists (1914 and 1933). In the years surrounding the Scopes trial, the psychologist James H. LEUBA surveyed a large number of US scientists in order to learn their beliefs about God and immortality. In both polls, disbelievers (not including doubters or agnostics) represented a plurality over believers and doubters (see table 1). Further, the least likely to be believers were psychologists, followed by sociologists, biologists, and physicists, in that order. The order

stood firm across the years. Distinguished scientists (as identified by *American Men of Science*) exhibited a substantially greater rate of disbelief than "lesser" scientists.

Table 1. Rates of disbelief among scientists, percent.

	All Scientists		Greater Scientists	
Survey	God	Immortality	God	Immortality
Leuba, 1914	42	20	53	25
Leuba, 1933	56	41	68	53
Larson, 1996–98	45	47	73	73

Leuba's poll was, however, not without problems. First, because the United States was almost monolithically Christian, Leuba formulated two questions that asked, in essence, whether respondents believed in a particular Christian conception of God. Asking his questions in that way militated against getting positive responses from, for example, pantheists such as Robert Millikan and Albert Einstein, who associated God with the universe and its laws and thus did not revere, in Leuba's words, "the God of our Churches." Leuba asked respondents whether they believed in "a God to whom one may pray in the expectation of receiving an answer" (a question specifically defined to exclude psychological or subjective consequences of prayer), disbelieved in such a God, or had no definite belief. Second, several questionnaires were returned with remarks intended to justify the respondents' refusals to answer the questions. According to Leuba, most of these were from disbelievers; hence, he concluded, the percentage of disbelievers may have been understated in his poll.

Scientists are more educated than the general population, and Leuba, a religious humanist, thought that increasing education would decrease rates of belief in God. To test his hypothesis, he surveyed college students at two unidentified colleges: a high-ranking college that was divided among the major Protestant denominations and a college that was "radical" in its leanings. In both colleges, the number of believers in both God and immortality decreased with age or academic advancement (freshman through senior years). Leuba also cited a decrease in belief at one of the colleges between 1914 and 1933, as well as similar results found at Syracuse University in 1926. Leuba, a professor at Bryn Mawr College outside Philadelphia, did not identify the two colleges in his study, but they were probably in the northeast, if not the Philadelphia area. If the major Protestant denominations means the mainline Protestant churches, then Leuba's studies of college students may not be representative, inasmuch as they omitted students affiliated with churches not heavily represented in the northeast. Oddly, Leuba did not mention the Roman Catholic Church.

Measuring Unbelief among Scientists (1990s). In 1996 and 1998, Edward J. Larson and Larry Witham replicated Leuba's surveys. For consistency, they did not edit Leuba's questions, despite the cultural changes that had occurred in eighty years. Additionally, *American Men and Women of Science* no longer highlights eminent scientists, so Larson and Witham derived their "greater" scientists from the membership of the National Academy of Sciences; comparison with Leuba's "greater" scientists is therefore problematic, because the NAS probably contains substantially more-eminent scientists than the highlighted scientists of the earlier surveys.

Larson and Witham found that nearly 50 percent of the scientists and nearly 75 percent of the "greater" scientists surveyed disbelieve in both God and immortality. An additional 15 to 20 percent are doubters. It is hard to make much of a series of three numbers, but during the century the percentage of disbelievers increased monotonically in every category, except for a peak in the percent of scientists who disbelieved in 1933. Disbelief in immortality more than doubled among scientists in general and nearly tripled among "greater" scientists. It is thus hard to credit Larson and Witham's claim that belief among scientists has remained more or less steady for eighty years.

C. Mackenzie Brown has analyzed Leuba's data and also suggested that demographics may make comparison between Leuba's and Larson and Witham's surveys difficult. For example, more scientists now are women, and women (though not necessarily women scientists) are statistically more likely to be religious than men. This factor could reduce the number of disbelievers in the later surveys and possibly disconfirms Larson and Witham's conclusion that scientists' religious beliefs have not changed much since 1914. Brown has similarly noted that applied scientists are underrepresented among the greater scientists and adds dryly that their underrepresentation may be relevant to any discussion of the beliefs of eminent scientists.

In 1998 Laurence Iannaconne and his colleagues examined existing data gathered between 1972 and 1990, and tried to assess the prevalence of scientists' belief in God. They found that 19 percent of "professors/scientists" have "no religion" and 11 to 21 percent "oppose religion" (see table 2). It is hard to compare these figures with those of Leuba and Larson, but arguably between 27 and 40 percent of professors/scientists may be doubters or disbelievers. The study broke the data down further by discipline and found a hierarchy similar to that found by Leuba: Social scientists, at 36 percent, were most likely to have no religion, followed by physical scientists and mathematicians (27 percent) and life scientists (25 percent). Among the social scientists, sociologists (35 percent), psychologists (48 percent), and anthropologists (57 percent) were most likely to have no religion. According to a 2003 Harris poll, by contrast, 90 percent of all adults believe in God and 84 percent in survival of the soul after death; that is, 10 percent disbelieve in God or are doubters, and 16 percent disbelieve in immortality or are doubters.

Table 2. Rates of disbelief or doubt among professor/scientists, percent

Survey	Has no religion	Opposes religion	Immortality
Iannaconne, 1972–90	19	[a]	34[b]
Math, Physics, Life Sciences	~25	11	
Social Sciences	36	13	
Psychology	48	21	
Anthropology	57	19	

[a] Not given.

[b] That is, 66 percent believe in afterlife.

Interpreting the Data. Leuba speculated whether scientists become disbelievers or whether independent thinkers willing to confront reigning orthodoxies become scientists. The greater scientists are presumably on average more-independent thinkers than the lesser; the fact could account for the increase of disbelief among greater scientists. That conclusion is supported by a study by Fred Thalheimer, who concluded that religious beliefs are frequently set during high school or college and that nonreligious students may choose more intellectual or theoretical endeavors.

Scientists who study biology, psychology, and sociology and anthropology are more likely to disbelieve in God and immortality than physical and applied scientists. Leuba speculated that physicists and engineers see a creator in the lawfulness of the physical and engineering worlds. Social and biological scientists may be less likely to see lawfulness in their studies, and Brown asks, further, whether social and biological scientists are perhaps influenced by the suffering that they see and physical scientists do not see. Thus, the question may be why biological and social scientists are more likely to disbelieve, rather than why physical scientists and engineers are less likely. Arguably, then, science leads to disbelief, at least among those already inclined to be independent thinkers.

Leuba predicted that increasing scientific knowledge would lead to increasing disbelief. That prediction is apparently (at least partly) correct. He further predicted that the religions would adapt to the best scientific insights and "replace their specific method of seeking the welfare of humanity by appeal to, and reliance upon, divine Beings, by methods free from a discredited supernaturalism." That prediction, at least so far, is largely incorrect.

MATT YOUNG AND JOHN LYNCH

SCOTT, THOMAS (1808–1878), English freethought pamphleteer. Thomas Scott was born into a wealthy family. His early life is rather obscure, but it is known that he was a page in the court of Charles X, a noted fisherman and hunter, and a world traveler. He is also known to have spent some time with Native Americans.

Between the years of 1850 and 1860, Scott became a rationalist (see RATIONALISM) and began publishing what we know today as the Scott Pamphlets. Scott used his own fortune to publish works that were heterodox in thought. Beginning in 1862, Scott published well over 250 of these tracts from his home in Ramsgate (about thirty kilometers southeast of London).

The authors of these works included rationalists, atheists (see ATHEISM), freethinkers (see FREETHOUGHT), and also Anglican clergy, Unitarians, and others as well.

Scott himself wrote about various aspects of Christianity. Some of the more prolific authors of Scott's tracts included Moncure CONWAY, Charles Voysey, Charles Bray, James Cranbrook, George Jacob HOLYOAKE, Francis Newman, and George G. Zerffi.

Another of Scott's writers was Annie BESANT, who—after having lost her faith and before she met atheist activist and member of Parliament Charles BRADLAUGH—became acquainted with Scott and his wife. The Scotts helped to support Besant after her Anglican husband kicked her out of their home. Scott paid her for writing a number of tracts, mostly about Christianity, but also on euthanasia, prayer, and natural religion. In her autobiography, she stated that "[t]o no living man—save one—do I owe a debt of gratitude that I owe to Thomas Scott."

During this time, Scott played host to a salon of thinkers, similar to Baron d'HOLBACH's coterie. At its gatherings the ideas of the day were discussed and argued over. Scott himself remained a theist, actually becoming a patron of Charles Voysey, who was removed as a Church of England vicar and subsequently founded the Theistic Church of London. But Scott was a freethinker in the sense that he allowed all types of thought, including heretical, atheistic, and religious, to be written about in his pamphlets and spoken of in his home. Scott died in December 1878.

TIMOTHY BINGA

SEAVER, HORACE (1810–1889), American writer and editor. Though in early life he desired to become an actor against his parents' hope that he would become a minister, Horace Seaver instead became a dedicated editor and speaker in the cause of FREETHOUGHT. As a result of working as a printer for the freethought paper *BOSTON INVESTIGATOR* while its editor and publisher Abner KNEELAND faced trials for blasphemy in Boston in the 1830s, Seaver was won over to "the cause." After Kneeland left for Iowa in 1838, Seaver became a coeditor of the *Investigator*, where he remained for the rest of his long career.

Seaver served as president of the Infidel Association of the United States, founded in 1858, the year of the *Dred Scott* decision, and he became identified with the abolitionist cause at that time. Like William Lloyd Garrison, he vigorously protested the support of slavery by various Christian churches.

At one point during the Civil War, Gen. Ulysses S. Grant issued an order expelling Jews from territory under his command on grounds they were profiteering from the conflict. Though the order was soon rescinded, it marked a low point in anti-Jewish prejudice in the Union ranks. Similarly, in 1863 Seaver commenced a series of articles about the backwardness of the Jews, published in the *Investigator*. The noted atheist activist Ernestine ROSE replied indignantly. The ensuing exchange, which continued for three months in the pages of the *Investigator*, probed the difficult problem of the parameters of criticism of an ethnic group and its religious views. Seaver weakly protested that his criticism of the Jews was of their religion, and not of them as a people. Rose was sensitive to the long, sordid past of anti-Semitism by Christians, but neither did she defend conservative Judaism. Modern scholars have suggested that the debate reflects the persistence of nativist views among the ranks of some nineteenth-century freethought leaders.

Upon the death of his wife, Seaver introduced a bold innovation at her funeral, where instead of having a minister or priest presiding, "he addressed the mourning circle of friends, and the address was printed in pamphlet form, and is admired as a model of eloquence, pathos, and noble sentiment."

In his latter years, Seaver attended freethought conventions and also took an interest in Spiritualism (see SPIRITUALISM AND UNBELIEF). Upon Seaver's death in 1889, Robert Green INGERSOLL delivered a tribute in Boston's Paine Hall, saying that "reared amidst the cruel superstitions of his age and time, he had the manhood and courage to investigate, and he had the goodness and the courage to tell his honest thoughts. . . . He attacked the creed of New England—a creed that had within it the ferocity of Knox, the malice of a Calvin, the cruelty of a Jonathan Edwards—a religion that had a monster for a God—a religion whose dogmas would have shocked cannibals feasting upon babes."

FRED WHITEHEAD

SECULAR HUMANISM. In a time when many have forsaken otherworldly religions, what does human life mean? What is its significance? Are there any ethical values and principles that nonreligious individuals can live by? Secular humanism attempts to answer these

questions in a way that resonates with human aspirations and the findings of science. It provides a scientific, philosophical, and ethical outlook that exerts a profound influence on civilization: one which may be traced back to the ancient world, through the modern world, down to the present. Today many schools of thought broadly identify with humanist ideas and values. By conjoining the term *secular* with *humanism*, we may narrow its focus and meaning, enabling us to distinguish secular humanism from other forms of humanism, particularly RELIGIOUS HUMANISM.

Succinctly, secular humanism rejects supernatural accounts of reality; but it seeks to optimize the fullness of human life in a naturalistic universe. Secular humanism and modernism have often been considered as synonymous, for secular humanism finds meaning in this life here and now and expresses confidence in the power of human beings to solve their problems and conquer uncharted frontiers, the theme of the modern world of exploration and discovery. In the contemporary world, however, secular humanism affirms a bold *new paradigm* that weaves together many historical threads, but adds much more that is relevant to our rapidly emerging planetary civilization.

History. *Classical Roots.* Secular humanism traces its heritage back to Confucian China (see CONFUCIANISM), to the CARVAKA materialist movement in ancient India (see INDIAN MATERIALISM, ANCIENT), and to the writers, artists, and poets of ancient Greece and Rome (see ANCIENT WORLD, UNBELIEF IN). Its origins can be glimpsed in early Greek philosophy, especially in its efforts to develop a theoretical philosophical and scientific outlook on nature, in its emphasis on human rationality, and in its conviction that the good life can be achieved through the exercise of human powers and the fulfillment of human nature. PROTAGORAS stands out as a humanist in view of his statement that "man is the measure of all things." However, humanistic strains can be seen in other Greek philosophers: the Sophists (see SOPHISM), who attacked conventional morality and sought new ethical standards; and also SOCRATES and Plato, who rejected the Homeric myths and sought to base ethics on rational inquiry.

ARISTOTLE's *Nicomachean Ethics* has been taken as a model of humanistic ethics as it champions the life of practical wisdom and the fulfillment of virtue and excellence. Roman philosophy also expressed humanistic values: this was especially true of Epicureanism (Epicurus and LUCRETIUS), STOICISM (Epictetus and Marcus Aurelius), and SKEPTICISM (Carneades, Pyrrho, and Sextus EMPIRICUS).

Humanism was eclipsed during the Dark Ages, during which faith dominated Western culture and humans looked vainly outside of themselves to a deity for salvation. Humanism began to reappear with the rediscovery and translation by the Islamic philosopher AVERRÖES of the works of Aristotle in the twelfth century, and their transmission to Europe during the Middle Ages.

Modern Secular Humanism. It was during the Renaissance, beginning in the fourteenth century—when there was a turning away from the Bible back to classical pagan virtues, and an effort to secularize morality—that humanism began to flourish again as a literary and philosophical movement. Writers emphasized that the good life and happiness were possible and that earthly pleasures were to be cultivated, not condemned. Gianozzo Manetti, Marsilio Ficino, and Giovanni Pico della Mirandola were philosophical humanists. They highlighted the dignity of human beings, their capacity for freedom, and the need for tolerance (see ITALY, UNBELIEF IN). Desiderius ERASMUS of Holland was especially noted as a humanist because of his defense of religious tolerance.

The emergence of modern science in the sixteenth and seventeenth centuries enabled secular humanism to assume a recognizable form. Many thinkers helped to bring this outlook into being. For example, Michel de Montaigne expressed both skeptical and humanistic values. Baruch SPINOZA, a bridge between the medieval and modern outlook, defended FREETHOUGHT, rejected biblical revelation as a source of ethics, paved the way for a new science of nature, and attempted to naturalize RELIGION by identifying God with nature.

The first major protest by what we may recognize as modern secular humanists was their defense of freedom of inquiry against ecclesiastical and political censorship. In part because of this, secular humanism and freethought are closely identified in the modern world. The fates of Giordano BRUNO, burned at the stake, and Galileo GALILEI, shamed and sentenced to house arrest, for challenging traditional views of the cosmos are central to the humanist call for freedom.

It was the development of the scientific method and its application to nature that brought a decisive intellectual influence to bear on humanist thought. Humanists wished to use reason (as with René DESCARTES) or experience (as with Sir Francis Bacon, John LOCKE, and David HUME) to account for natural processes and discover causal laws. This meant that appeals to the authority of religious revelation and tradition were held illegitimate as a source of knowledge.

The scientific revolution began with the impressive development of physics, astronomy, and natural philosophy. The Enlightenment or Age of Reason (see ENLIGHTENMENT, UNBELIEF DURING THE) is testimony to humanist efforts to extend the methods of reason and science to the study of society and the human being. In the eighteenth and nineteenth centuries there was widespread confidence that with the spread of reason, science, and education, human beings could be liberated from superstition and build a better world. Thinkers like M. J. A. de Caritat de CONDORCET set forth a progressive prospectus for humanity. Deists (see DEISM) were critical of clericalism (see ANTICLERICALISM), rejected appeals

to biblical revelation, and sought to develop a religion of nature and reason. Significant figures include VOLTAIRE, Denis DIDEROT, and the Baron d'HOLBACH. Also in the modern period, democratic revolutions proclaimed "liberty," "equality," and "fraternity," and heralded "life, liberty, and the pursuit of happiness." (For the French Revolution see FRANCE, UNBELIEF IN; see also FRANKLIN, BENJAMIN; JEFFERSON, THOMAS; MADISON, JAMES; PAINE, THOMAS.) Humanists defended the ideals of freedom against a repressive government or church, insisted on tolerance for opposing viewpoints, and championed a belief in the right of free conscience and dissent. Utilitarians including Jeremy BENTHAM, James Mill, and John Stuart MILL continued these trends in the nineteenth century, judging legislation by its effect on the common good.

Secularism. Along with the growth of humanism has come the growth of secularist ideals (see SECULARISM). The modern world has witnessed the widespread secularization of life. This means first that morality could be freed from religious authorities. The values and ideals of REASON, freedom, happiness, and social justice would be substituted for the virtues of faith, hope, and charity—and for an exaggerated sense of sin. Second, secularization involved an effort to limit ecclesiastical control over the various institutions of society, especially the state, the schools, and the economy. Fear of an established church led to the principle of the separation of church and state, embodied in the First Amendment to the US Constitution, a document that explicitly derives its authority not from God but from "We the People." Thomas Jefferson, Thomas Paine, Benjamin Franklin, James Madison, and other leaders of the American Revolution were deeply influenced by secular and humanist ideals.

Contemporary Secular Humanism. In the nineteenth and twentieth centuries a growing number of thinkers (Karl MARX, Sigmund FREUD, Albert CAMUS, Bertrand RUSSELL, John DEWEY, George SANTAYANA, Alfred J. AYER, and Sidney HOOK) and movements (MARXISM, EXISTENTIALISM, PRAGMATISM, NATURALISM, positivism, behaviorism, libertarianism, and others) have claimed humanist credentials. Forms of humanism that claim to be religious also proliferated, especially in the twentieth century. The term *humanism* is considered so ennobling that few thinkers are willing to reject it outright. Thus, the Roman Catholic philosopher Jacques Maritain referred to "Christian humanism" as a concern for the amelioration of the human condition on earth, and maintained that Christian humanism is the most authentic form of humanism. Liberal UNITARIAN UNIVERSALISM also fits under this rubric. Religious humanists introduced a distinction between a "religion" and the supposed "religious" qualities of experience, choosing to emphasize the latter. They considered "God" not as an independently existing entity but as a human expression of the highest ideals (Dewey) or of our "ultimate concern" (Paul Tillich). Such attempts at redefinition are generally nontheistic.

In contemporary society secular humanism has been singled out by critics and proponents alike as a position sharply distinguishable from any religious formulation. Religious fundamentalists in the United States have waged a campaign against secular humanism, claiming that it is a rival "religion" and seeking to root it out from American public life. Secular humanism is avowedly *nonreligious*. It is a *EUPRAXSOPHY* (good practical wisdom), which draws its basic principles and ethical values from science, ethics, and philosophy.

In the late twentieth century the papacy of John Paul II had abandoned the reformist agenda of the Second Vatican Council (Vatican II, 1962–65), which had expressed many humanist values. In the early twenty-first century, Pope Benedict XVI rejected "secularism" and "relativism," which he considered to be purely subjective. Islam has likewise vigorously opposed secularism, many adherents insisting that Muslim law (sharia) is rooted in the Qur'an. Muslim extremists have defended theocracy rather than democracy, and they have even threatened jihad against those who espouse the secular outlook and champion freedom of conscience. Following Heidegger, many French postmodernist philosophers have likewise rejected humanism, along with any notion that science can be objective or that science and technology can provide the basis for a philosophy or ideology of emancipation. It should be noted, however, that other French thinkers held dissenting positions. Jean-Paul SARTRE argued that existentialism *was* a humanism; Simone de BEAUVOIR constructed an emancipatory defense of the rights of women rooted firmly in humanist principles. Contemporary secular humanists have been highly critical of postmodernism for its rejection of modernism, its pessimism, and its NIHILISM about the human prospect.

A New Paradigm. Secular humanism provides a comprehensive synthesis of several key intellectual and ethical trends in world civilization. This new paradigm draws from freethought and RATIONALISM, ATHEISM and AGNOSTICISM, skepticism and unbelief. Yet it goes beyond these historic movements by crafting a new outlook relevant to contemporary times. It has sometimes been taken as negative because it criticizes the sacred cows of society; but it actually delivers a positive ethical message that has significant pragmatic consequences for human culture. It presents affirmative alternatives to the reigning orthodoxies.

The secular humanist paradigm has six main characteristics: (1) it is a method of inquiry; (2) it provides a naturalistic cosmic outlook; (3) it is nontheistic; (4) it is committed to humanistic ethics; (5) it offers a perspective that is democratic; and (6) it is planetary in scope. I should point out that many allies within the freethought or rationalist movement may accept one or more of these characteristics without accepting them all. Some mistak-

enly consider secular humanism to be equivalent with atheism, others with methodological naturalism, and still others with humanistic ethics. Secular humanism, however, is broader than any of these views; for it provides an integrated scientific-philosophical synthesis that encompasses all of these and more. This is sometimes called naturalistic humanism.

Ultimately, secular humanism proposes nothing less than the complete implementation of the agenda of modernism. This agenda in fact has yet to be fully implemented; what is necessary for it to occur is a *post-postmodernist* New Enlightenment.
